"It may be proper here to make a few remarks on the character of the ass, and its nearest congeners, as compared with those of the horse, upon which it has been thought necessary to establish them as distinct genera in the family. It is true, that in the absence of any knowledge of the original condition of the horse, the question can only be considered with reference to the characters of a domesticated and probably much altered race; but as the distinctions upon which the division in question is founded are structural, there is less danger of error than if they had been only those of colour or of general form. The character of the tail is one of the most striking points upon which this distinction rests. In the horse, the whole of this part is covered with long hair, totally concealing its actual form; whilst in the whole of the others, the ass, the zebra, the quagga, the dzigai, &c. it is only clothed with long hair towards the extremity. The mane of the horse, also, is long and flowing; that of all the other species is short and upright. In the former animal, the hinder as well as the fore legs are furnished with those warty callosities which, in the others, without exception, are found only on the fore legs. Waving some other particulars of minor importance, there is one character which, if not in itself to be considered as of primary value, is yet interesting, and not unimportant as a collateral distinction; I mean the general tendency of the coloration and marking in the two forms. In the horse's coat there is an obvious disposition to the formation of small round spots of a different shade or hue from that of the ground,—and this is the case whether the general colour be black, chestnut, or gray: in the genus *Asinus*, on the contrary, the markings are invariably disposed in stripes. The zebra, the quagga, and the mountain zebra, are examples too familiar to require more than this allusion: and in the common ass, not only is the same tendency evinced by the cross mark on the shoulders, but in the young ass there are frequently observed some obscure darkish bands on the legs. These tendencies to a peculiar character of coloration and marking, are well worthy of especial notice in the Mammalia, among which will be found nume-

rous instances bearing upon the distinction of approximating forms. In birds and insects it is still more general and striking, and has always attracted the attention of naturalists; but in the present class it has certainly been too much overlooked."

The mule is the next object of inquiry, and the question of hybrid progeny, and the powers of transmission, is treated of in a striking manner. The author concludes that there is no instance on record of two mules having bred together; though they may with either parent, the horse or the ass. A note at p. 390, we do not think so conclusive as he does; we remember the Bible history, how the cunning patriarch procured the young lambs to be marked. We quote, however, a few sentences, bearing upon the most singular fact in this investigation:—

"The horse and the ass will breed also with the zebra or the quagga; and there are, at the present time, a pair of mules between the former animal and the ass, belonging to the Zoological Society, which are constantly employed in drawing a light cart, laden with provision, &c. One of the most remarkable instances of this kind, however, is the celebrated case of a mare belonging to the Earl of Morton, which indeed affects, in the most important manner, a point of great interest, both to physiologists and to breeders of animals. The point proved is, that the characters of the male parent of the mother's first progeny, exert a marked influence on her subsequent young, whatever may be the peculiarities of the father of the latter. This truth has been already illustrated, when treating both on the dog and on the hog, and it receives a remarkable and interesting confirmation from the present fact. The circumstances were as follows:—The Earl of Morton, being desirous of obtaining a breed between the horse and the quagga, selected a young mare of seven-eighths Arabian blood, and a fine male of the latter species; and the produce was a female hybrid. The same mare had afterwards, first a filly, and afterwards a colt, by a fine black Arabian horse. They both resembled the quagga in the dark line along the back, the stripes across the forehead, and the bars across the legs: in the filly the mane was short, stiff, and upright, like that of the quagga; in the colt it was long, but so stiff as to arch upwards, and hang clear of the sides of the neck: in other respects they were nearly pure Arabian, as might have been expected from fifteen-sixteenths Arabian blood. By what means this mark is fixed upon the future offspring, by a being with which it has no possible immediate connexion, whether by an indelible impression on the sensorium of the mother, or by any other mode of which we are at present wholly ignorant, is a question only to be decided by a series of the most careful experiments; and it must be acknowledged, that there is scarcely a subject in the whole range of physiological inquiry more deeply interesting. This is not, indeed, the place in which such a matter can be discussed; but it will not be deemed irrelevant even to the object of this work, to entreat the attention of those who have it in their power to clear up so important and obscure a question, to the means by which it may be best effected, and which will at once strike every one interested in physiological investigations. That the influence of mental impressions is sufficient, in numerous cases, to account for peculiarities in the offspring of many animals, we have facts enough to render at least very probable; but it is only by numerous well-directed experiments that it

can be brought to a satisfactory and certain conclusion."

Mr. Bell proceeds to the Cervidae, and we have red deer, fallow-deer, and roe; the Bovidae follow, and we have the ox, &c.; next, the Capridæ and sheep, before we arrive at a new order, the Cetacea. From the Bovidae we shall be contented with only one illustration, respecting an animal the most familiar.

"The period of gestation of the cow is nine months. One fact connected with this part of her natural history it is necessary to mention, as it is one of considerable physiological interest. It is well known, that if the cow produce twin calves, one of each sex, the male is perfect, and the female barren; which last is termed a free martin. This is so generally true, that there are not, I believe, more than two or three authentic instances of its fertility. For the anatomical and physiological facts connected with this subject, I refer to the well-known papers of John Hunter, on the Free Martin, in his work on the 'Animal Economy.' The following etymology of the name is taken from the 'Glossary of the Dialect of Craven, in the West Riding of Yorkshire':—'When a cow produces two calves, one a male and the other a female, the female is styled a free martin; which, it is said, never breeds. In Scotland, a cow, or an ox, which is fattened, is called a mart. Hence, probably, the term originated. The female, not fit for breeding, was free, or at liberty for fattening.' My friend Mr. Yarrell suggests, that free martin may mean, 'free for the mart, or market.'"

Might it not be from the slaughter of the animal to be stored for winter food always taking place at *Martinmas*, in the month of November?

The Cetacea come last, and the round-headed porpoise, the white whale, the bottlehead (rare), the sea unicorn, and the Greenland spermæcetæ, and other whales, fill up the measure of an excellent publication. A neat title-page, a preface, and a general index, deserve our most favourable verdict in summing up the merits of the whole case. We conclude with an extract, touching the narwhal, or sea unicorn:—

"In most cases, one young one only is produced, which is suckled for a considerable time with the greatest care. To what extent the ascribed power of the tooth may be true, we have but little means of ascertaining; but there is the structural evidence of its form, and its extraordinary development, to indicate that there must be some especial use for so long, and sharp, and powerful a weapon; and really, there seems no reasonable ground for assigning to it any other object than that formerly attributed to it by the ignorant—namely, that of defence. In this respect it forms, indeed, an additional instance to numerous others, of gregarious animals, to the males of which alone belongs such a development of the teeth or the horns as shall constitute them the natural defenders of the herd. The elephant, the wild boar, and even the horse, offer examples of the former, and the antelopes and deer of the latter; and there can be no doubt that the restriction of this weapon to the males, in the narwhal, has a similar object. The usual length of the exerted tooth is about six feet, but it sometimes occurs as much as nine, or even ten feet long. The ivory of which it is composed is extremely compact, and of a beautiful white colour. It is spirally twisted from left to right, is quite straight, tapering to a rather obtuse apex, and is hollow from the base to within ten or twelve inches of the point. It would be a strange anomaly were the apparent singleness of this

weapon real; but the truth is, that both the teeth are invariably formed in the jaw, not only of the male, but of the female also,—but that in ordinary cases one only, and this in the former sex, is fully developed, the other remaining in a rudimentary condition, as is the case with both in the female. To what immediate physiological cause this extraordinary development of one tooth, at the expense, as it were, of its fellow, is to be attributed, it would, perhaps, be difficult to conjecture. It is found that sometimes it is on the right side, but much more frequently on the left; and the corresponding tooth remains extremely small, or even permanently concealed. There are, however, several instances on record, in which both teeth have been exerted to an almost equal extent. It also now and then occurs, that in the female the teeth acquire a considerable size. That this does not arise, as in the partial assumption of the male character in the females of some other animals, from ovarian deficiency, either from age or disease, is proved by the fact of a female narwhal thus furnished, being found pregnant with two young. An instance is recorded in which one of this sex had two very long and fully developed tusks, of which that on the left side was seven feet five inches long, and the other, seven feet.”

The last work on our list is *The Naturalists*, edited, from No. VII., by Mr. Neville Wood.\* It seems to have received an accession of information and spirit; and is a very miscellaneous and interesting periodical. A paper on the lemur family; another on the muscular apparatus of the wings of birds, on their migration; on poisonous plants in Yorkshire, &c. &c. &c. bring many facts and observations before the reader, and open the way to other intelligence of the same order, which is always perused with gratification. An explanation of the Latin names of British birds is peculiarly valuable and useful for the ornithological student. The following story, related of the fitchet weasel, is remarkable:—

“Bewick says, that this animal, during the winter, has a mode of procuring subsistence which has hitherto escaped the observation of naturalists, and which, though singular, he can vouch for the truth of. In a severe storm, one of these animals was traced, in the snow, from the side of a rivulet to its hole, at some distance from the stream. As it was observed to have made frequent trips, and as other marks were seen which could not easily be accounted for, it was thought worthy of greater attention. Its hole was accordingly examined, the fitchet taken, and eleven fine eels were discovered to be the fruit of its nocturnal excursions. He observes, that ‘it may be a matter of curious investigation for future naturalists, to inquire by what art this wily animal finds its booty, so apparently difficult to obtain.’ I have often traced the fitchet along the edges of streams and rivulets, and anxiously endeavoured to witness a repetition of this fact, mentioned by Bewick; but, though I have examined many holes, from which fitchets have been taken, I have never seen in them the remains of eels, or any other kinds of fish; and I should be inclined to think, that eels are not a very common dish with the species. The skins and bones of field-mice, the limbs of frogs, and the feathers of birds, are the remains generally met with in their holes.”

As we have no doubt that eels leave the water and traverse dewy meadows, we are the more readily inclined to believe that they

might become the prey of the fitchet, without its being obliged to have recourse to any of the extraordinary art supposed by Mr. Bewick. An eel in the grass would be an easier and a safer supper than a snake in the grass.

Brief reports of the proceedings of societies engaged in corresponding pursuits, add to the value of Mr. Wood's labours.

#### CRITICISM MADE EASY!

*The Natural History of Birds, Quadrupeds, Fishes, Serpents, Insects, &c.; with interesting Memoirs, striking Anecdotes, faithful Likenesses of the principal Individuals, &c.* By the Rev. W. Tiler. Pp. 472. London, Simpkin and Marshall, Crofts; Derby, Moxley and Son; Manchester, Banka and Co.

WE very frequently receive, with publications, large separate sheets, containing the most piquant extracts from them, and duly appended to each, in italic type, references to the work, name of the author, &c.; and, occasionally, a little bit of praise and puffery. As these *morceaux* generally figure in the newspapers afterwards,—being especially convenient to fill up corners when there is a dearth of politics, balloon accidents, explosions on the river, or police reports of extraordinary adventure among savages,—we rather avoid than allow ourselves to be led by them in the pleasant paths of our critical duty. But the volume, whose title heads this notice, has come to us in another shape, and one which makes criticism so easy, that we are sure our readers will not object to our lightening our weekly labour by adopting it. It consists of a printed letter, signed R. Aled (a fit name to save us from toil, with which our own head might have ached), and runs as follows:—

“Sir,—I shall feel greatly obliged by your noticing the volume now sent. I feel anxious for an early notice, as it is my intention to publish extracts from all the papers and periodicals that notice it. *You may safely say, that it is the neatest and cheapest work of the kind ever offered to the public.* It is embellished with nearly a hundred engravings. You will find a remarkable and interesting description of the frontispiece, and numerous anecdotes never before published. The work may be recommended as a class-book for schools, and as being well adapted for Sunday school libraries. The author (the Rev. W. Tiler) is an independent minister, and has endeavoured to impress his readers with a lively sense of the wonders of creation. I am your obedient servant,” &c.

The reverend author shall certainly, as far as we are concerned, be a minister independent of criticism; and even of the frontispiece we shall only say, that it represents a grenadier bayoneting a royal Bengal tiger, and two other grenadiers, running away as fast as their legs will carry them, though they are carrying their arms. A portrait of Tyrone Power, as *Teddy the Tiler*, might have been introduced as a novelty; but surely, enough has been done, and we have only to require Mr. Aled to fulfil his intention, and publish the extract from the *Literary Gazette* that notices *Tiler's Natural History of Birds and Beasts*.

*M. Tullii Ciceronis Orationes Selectæ ex recensione Jo. Aug. Ernesti: with an English Commentary, and Historical, Geographical, and Legal Indexes.* By Charles Anthon, LL.D. London, 1837. Priestley.

WE have already noticed, favourably, the editions of Horace and Terence, by Professor Anthon and Dr. Hickie; nor do we see any

reason to speak in other terms than those of approbation of these select Orationes of Cicero, which are published upon the same principle as their predecessors. In this volume are contained the four speeches against Catiline, together with those for Archias, Marcellus, the Manilian Law, and Murena. The text is nearly identical with that of Ernesti, and the notes, as in Professor Anthon's former undertaking, are accurate and explanatory to the highest degree. The editor, in his preface, anticipates, against this work, the charge we have once before made against a similar production, namely, that the commentary is too copious, and absolutely too much assistance is afforded to the student. He says, in opposition, that one of the most powerful causes that have tended to bring classical learning into disrepute, is the insufficiency of such information, which it is nearly impossible to convey by oral instruction, but which may be easily and advantageously procured from the notes of the textbook. We are as much alive as the Professor to the indispensable necessity of commentary and illustration, in every work addressed to the student; but we would always recommend the utmost caution, lest the supply of information should exceed the real wants of the inquirer. The acquirements of classical literature, though of great value, are not, abstractedly considered, the ends for which this branch of learning is so justly and universally cultivated: it is the course of training which the mind has to undergo in the acquisition of this knowledge, which is the true and real benefit sought after in its pursuit. These very speeches of Cicero, though models of the purest eloquence, are not so much read by the young student, as specimens of the beauty and arts of oratory, which he would find as clearly displayed in the pages of his own Burke or Chatham, as exercises for the understanding. In the perusal of an author of this nature, the nicer portions of our judgment and reason are called into play to elucidate his meaning, and detect his allusions. Attention, observation, and industry, are habits induced by pursuits of this nature; and the mind, by a constant series of these and similar operations, gradually acquires fresh power, and an acquaintance with its own resources. Every thing, therefore, that tends to diminish the call upon the intellect for those exertions which it is competent to employ, is clearly prejudicial to the interests of that study which it professes to promote; and although, from a constant application to a too copious store of appended information, the reader's knowledge may, for the time, seem considerably enlarged, yet, the acquirements attained in this way take but a slight hold on the memory, and afford but little assistance towards the unassisted mastery over fresh difficulties. Whether the notes attached to the work immediately before us fall under this objection, is a question which will be variously answered, and the reply to which ought properly to depend upon the age and progress of those in whose hands it is placed. To the younger aspirants after classical fame, who view the glories of the first class, and the classical tripos, through the vista of many years, we can safely recommend this edition, as an auxiliary to their labours; but we are afraid that those who are already wandering by the far-famed Cam and Isis, will scarcely derive enough advantage from the enormous mass of notes (more than half the volume) to compensate for the loss of time and exertion requisite for their perusal.

\* We have either mislaid or never received the No. VIII. and can only refer, therefore, to Nos. VII. and IX.

*Description of the Patent Metallic Lining and Damper for the Chimneys of Dwelling-Houses, &c.* By Mr. Seth Smith. 8vo. pp. 16. London, 1837. Longman and Co.; Carpenter and Son.

*M. Bernhardt on Heating Rooms, Ventilation, &c.*

Few things are of more importance to domestic comfort (and we say so, near about the dog-days, to shew that our opinion is a lasting one, and not suggested by wintry circumstances) than the means of heating the apartments in which we cook, eat, sleep, and breathe. The progress of chemical knowledge, and the improvement in mechanical arts, are ever and anon bringing forth inventions and apparatus for accomplishing this desideratum in the most perfect and healthful manner; and we look to an early period when there shall be no smoke to annoy, no cold to pinch, no fire to fever us; but all shall be equable, pleasant, and fit for specific purposes, and neither less nor more.

On the road to this economic millennium, Mr. Smith's chimneys, now in use at the Pantheon on a considerable scale, as well as in private houses, deserve our especial notice and commendation. They answer every purpose anticipated by that ingenious individual; and, if generally adopted, would save London from many a conflagration and loss of life. The slight work we have named gives a complete account of the plan, and the plates render the explanation obvious at a single glance.

Of Mr. Bernhardt's process we regret to say we cannot speak from personal observation, not having been able to accept his invitation to inspect it. But we can safely state, from the reports of others, men of competent authority, that it is a very excellent and satisfactory invention, and entirely fulfils the promises held out respecting it. When the autumn leaves fall, we may, perhaps, return to the present and immediate subject more in detail; but, in the mean time (being provoked thereto by Mr. Smith's introductory paragraph), we beg leave to turn back a little, for, we hope, the edification and amusement of our gentle readers; for the mode of heating apartments amongst the ancients is little known to us, and therefore it is that we trust the following notes, collected

\* "It has by some been (his book thus opens) considered doubtful whether the Greeks and Romans, during the period of their greatest eminence for architectural productions, had any chimneys in their dwelling-houses; but as Homer, Aristophanes, Virgil, and Apollonius, are supposed to mention or make allusion to them, it has been inferred by other writers that they were not wholly unknown to those ancient builders. The oldest account of the use of chimneys is stated to be 1747; and it is conjectured they were invented in Italy. Smoke-jacks, which must have been invented subsequently to chimneys, are supposed to be of German origin; and, from a painting which is known to be older than 1360, it is supposed they were in use before that period. In the houses discovered at Herculaneum and Pompeii, there are, it is said, no chimneys; but they appear all to have been warmed by means of flues and a subterranean furnace. Stoves and flues, it is thought probable, were introduced about the time of Nero. Seneca relates that, in his time, there were invented certain tubes, which were placed in the walls, by which the heat of the fire was made to circulate and warm equally the upper and lower apartments. These observations have been quoted as proofs that chimneys were unknown at the time periods, but have they not a contrary tendency? It appears more probable that a chimney should furnish the idea for such stoves, than that the use of stoves should be known before chimneys. In the Old Testament there are several allusions to furnaces for the smelting of iron and other metals, which would appear to leave no doubt of the use of chimneys being known at a very early period, especially to the Egyptians (See Gen. i. 15, xvii. Deut. 4, xx.; and Ezekiel, 22, xx.). In Nebeimiah, the towers of the furnaces are spoken of. In the 1st Book of Samuel, 30, xxx., a city is called the smelting furnace (Chor Ashan), probably from the number of chimneys erected in it. The Arabic root renders the word round; they were, no doubt, built in the form of a round tower of lofty height, like some of the chimneys, of manufactories at the present day."

from a variety of ancient writers on the subject, may be agreeable.

On the chimneys and fire-places of the ancients, Lipsius, in one of his epistles, says that neither Greeks nor Romans used chimneys. The word *caminus* in Latin, and *καμινος* in Greek, signified a furnace, and not a conveyance for smoke, like our modern chimneys. Vitruvius makes no mention of any, nor has any vestige of such been discovered. Cicero, in his Familiar Epistles, lib. vii. says, "Camino luculento utendum censeo."\* Horace, also, lib. i. od. 9.

"Vides ut alta stat nive candidum  
Soracte; nec jam sustineant onus  
Sylvæ laborantes, geluque  
Flumina constiterint acuto?  
Dissolve frigus, ligna super foco  
Largè reponens."

From which it may be inferred, that in order to make an apartment warm, it was the custom amongst the Romans to place wood upon the hearth, or a sort of brasier, and set fire to it. It is supposed the fire was kindled in the midst of the apartment, as in some parts of Italy amongst the peasantry; and that they allowed the smoke to escape through the apertures of the upper part of the chamber. It is probable that Virgil alludes to it in his fifth Eclogue:

"Aute focum si frigus erit, si messis in umbra."

And Varro, lib. i. De Vita Populi Romani: "Ad focum hyeme et frigoribus cantabant; festivo tempore in propatulo."†

Lipsius says they employed two methods of heating their rooms in winter; the first was with portable chafing-dishes filled with burning charcoal.

Suetonius, in his Life of Tiberius, observes: "Miseni cinis è favilla et carbonibus ad calefaciendum triclinium illatus, extinctus et jamdiu frigidus, exarsit repente prima vespere, atque in multam noctem pertinaciter luxit." From which a prognostication was drawn of the death of Tiberius. It was in like manner the custom in Greece. Plutarch relates, in his "Apophthegms," that Alexander the Great having been invited by a friend to a banquet in the winter time, and the servants having brought into the apartment a brasier with a little fire in it, Alexander commanded that they should either bring in more wood or procure some incense, because such a poor fire had more resemblance to a censor for burning a few grains of incense, than a fire to warm in the coldest season of the year. Plutarch, in the sixth book of his Convivial Questions, relates, that Anacarsides approved much of these brasiers, "quod fumum foris relinquentes, ignem purum in domum inferrent."‡ Another method of warming chambers amongst the ancients was this:—At the basement a fire was made, enclosed, and the heated air from which, conveyed in tubes fixed in the partition walls, that went up in a winding manner, was carried into every part of the house: these pipes had, in some places, certain apertures, which could be opened and shut at pleasure, by which they regulated the warmth of their rooms. In some ancient buildings remains of these pipes have been observed; which are likewise alluded to by Seneca, in his book De Providentiâ, chap. iv.: "Quem specularia semper afflatu vindicarunt, ejus cænationis subditus, et parietibus circumfusus calor temperavit." And in his Epistles, xc. "Quædam nostrâ demum memoriâ prodidisse scimus, et speculariorum usum, et impressos parietibus tubos, per

\* I am of opinion that they enjoyed the cheerful fire.  
† In cold wintry weather they sung often by the fireside; but in the summer, in the open air.  
‡ Leaving the smoke without, they brought the pure fire within doors.

quos circumfunderetur calor, qui una simul et summa foreveret æqualiter."\*

Julian the Apostate, in his oration, entitled "Misopogone," says, that in Paris, "Non calefaciebatur cubiculum in quo eram eo modo quo solent illic, sub caminis loca plerumque caleferi."† Which expression serves to prove that in his time chimneys were known in France.

The ancients were accustomed carefully to collect supplies of wood that should give little or no smoke, which the Greeks called *acapna*, that is, without smoke: and the Romans called it *ligna cocta*—as appears from a work on the signification of words: "Titlonis, et alia ligna cocta, ne fumum faciant."‡

Julius Capitolinus, speaking of Pertinax the emperor, says, "Pertinax pater Ælius successus fuit, qui filio nomen ex continuatione lignariæ negotiationes, quod pertinaciter eam rem gereret, imposuisse fatetur."§ And the same writer more clearly—"Pater ejus coctiliarum tabernam in Liguria exercuerat."|| A shop in which is sold well-dried wood fit for burning.

A Spartan who wished to accuse the master of the house, because he used this sort of wood, once said wittily, that by its strength in burning, and causing no smoke, he could not weep, the smoke affecting the eyes: "Jocose Lacon Gymnasiarchum, qui acapna præbuerat, accusare se, dixit, quod per eum nec lachrymari liceret." This jest is noticed by Plutarch.

Cardinal Baronius, in his annotations on the Roman Martyrology, cites the following words in the Life of St. Cecilia: "In aëre balnei sui inclusa, et subitus totâ die ac nocte magna vis ardentis ignis adhiberetur." &c.¶ And add, "Erat hic locus in balneo, ubi erat aër calidus nullæque in eo aquæ, sed æstus ad sudandum sub cujus loci pavimento ignis succendebatur, quo pavimentum ferventius redderetur."\*\*

It was an apartment made as before stated, which was heated by fires from beneath, with tubes inserted in the walls, which conveyed the heat. Such chambers were called *caldarium*, from the artificial heat introduced. Vitruvius, lib. v. ch. x. mentions them; and Pliny the Younger, lib. v. ep. xiv. alludes to their being used to suffocate persons of eminence, as was the case with Fausta Augusta, the wife of Constantine the Great, who was destroyed in this manner. In Herculaneum a portable stove has been found for heating water, warming the apartment, and cooking small eatables. And now, our fire is out, good night!

*Elements of Geology and Physical Geography.*

By W. Rhind. Pp. 104. 1837. Edinburgh, Fraser and Co.; J. Anderson. Jun.; M'Lachlan and Stewart: London, Smith, Elder, and Co.: Dublin, Curry and Co.

*The Science of Geology.* By XAOZ. Pp. 78. Glasgow, 1837. Reid.

The latter is a compilation of indifferent merit

\* We are aware, in fact, even within our own memory, that the use of windows was adopted, and pipes also were fixed in the walls, whereby the heat was diffused equally throughout the whole of the apartments.

† The room in which I slept was not heated in the manner which was customary there; the fire-places were generally under chimneys.

‡ The wood of a firebrand quenched, and other charred woods, make no smoke.

§ Pertinax succeeded his father, Ælius, who is reported to have given his son this name in consequence of his pertinacious continuing the business of a dealer in wood.

¶ His father kept a shop for charring wood in Liguria. Enclosed in the atmosphere of her bath, underneath which a large and powerful fire was kept up day and night.

\*\* There was a place in the bath where the air was hot, which had no water in it, but heat to produce perspiration, where, underneath the pavement, fire was kindled, by means of which the pavement might be made hotter.

(from another Greek of Glasgow—by the by, see *Literary Gazette* of Aug. 19), though containing the broad elements of the science in a brief compass. What sense, for example, can be made of the following sentence on the *faunula* in coal strata. "They are accompanied by a subsidence of the strata on one side, or an elevation on the other, and sometimes by both." Works for the young and unlearned cannot be too carefully written. The well-informed detect casual errors, and are not misled by them: not so those who, if they are worth instructing, pin their faith to their teachers, and earnestly try to imbibed and comprehend all they teach.

Mr. Rhind's book is of a superior class, and a very useful volume. It is not, however, without blemishes. Page 31, "Lydian stone" is mentioned, as a component of greywacke; but the reader has no intimation, before or after, what Lydian stone is. How, then, can he be informed by this in the composition of the secondary rock. Page 33, we have fine specimens of shells found in limestone, with imperfect references; p. 34, worse for worms, is a Scotticism; p. 36, *esquises* are mentioned, for the first time, among other products previously described; and thus it is (as far as the author informs us) an unknown among known vegetable remains; p. 37, an inexhaustible abundance of coal is asserted to exist in the great valleys to the westward of the Alleghany mountains. Is Mr. Rhind prepared to prove this?

But the volume is, as we have said, a very useful manual of geology; and, though the principal examples are selected from the researches of northern authors on the subject, they only do justice to the zeal and talent displayed by the Scottish geologists.

#### MISCELLANEOUS.

*The Pulpit*, Vol. XXX. London, 1837. Sherwood and Co.; Edinburgh, Oliphant.

It is gratifying to see a work of this kind encouraged to proceed to such an extent. Thirty volumes of sermons, by eloquent and pious preachers, cannot be promulgated throughout the country without producing good fruits. Many of these are very fine compositions: all tend to inculcate the best principles of morality and religion.

*The Young Scholar's Latin-English Dictionary; with a List of Latin Verbs, &c., Tables, &c.* By the Rev. J. E. Riddle, M.A. Small 4to. pp. 463. London, 1837. Longman and Co.; Murray.

An abridgement of the "Complete Latin-English Dictionary," and extremely well done for the use of learners; to whom the larger work will be of more service when they are further advanced.

*Peter Parley's Wonders of the Earth, Sea, and Sky*, edited by the Rev. T. Wilson. Pp. 336. (London, Darton and Clark.)—One of those nice little books which contain "lots" of various information for young people. The editor has made a good selection of matters connected with geology, meteorology, natural phenomena, &c. &c., and seasoned them with anecdotes and relations in an agreeable manner.

*Thomas's Burlesque Drama: No. V. The Mayor of Garratt; No. VI. The Baggart's Opera.* (London, Thomas.)—These cheap plays are accompanied by designs by R. Cruikshank, which agree with their humorous in representing the dramatical personae.

*The Young Minister's Guide, &c.* (London, Simpkin and Marshall.)—Our favourable opinion of this little volume has been justified by the speedy call for a second edition; to which the writer has added several novelties and improvements.

*British Colonial Library*, by R. Montgomery Martin. *The East Indies*, Vol. I. Pp. 367. (London, Whittaker and Co.)—A very neat and clear map illustrates this very useful republication, which well deserves the favour of the British and Indian empires.

*The Young Astronomer, &c.*, by the Rev. W. Fletcher, F.R.A.S. Pp. 120. (London, Wyld.)—A series of simple lectures, in which the elements of astronomy are clearly explained for the benefit of youthful students.

#### ARTS AND SCIENCES.

##### BRITISH ASSOCIATION.

EVERY needful preparation seems to be making for the reception of the Association at Liverpool. We copy the following from the "*Liverpool Times*:"—"The local council formed for arranging and conducting the proceedings is actively engaged. It comprises, without any distinction of party, active and zealous individuals of different pursuits and occupations, all animated by the desire that Liverpool should not fall short of the other places which have been previously honoured by the meeting of the Association, either in respectful attention to the many eminent strangers and foreigners about to assemble here, or in a just appreciation of the undoubted services which anniversaries of this nature render to the cause of science. The several literary and scientific institutions, the various libraries and news rooms, have offered all the accommodation in their power. The town council has also evinced an anxious wish to be a party to the cordial reception with which it is intended to welcome the Association—has made an offer of the noble and unrivalled suite of rooms of the Town-Hall, for the intended evening promenade meetings—and all the other buildings or accommodations over which it has any control are placed at the free disposal of the local council. The Earl of Burlington, president, has accepted an invitation from the mayor to reside with him during the meeting. Sub-committees have been formed out of the local council, to which separate duties have been assigned: one to receive the visitors at the Town-Hall on their first arrival—to deliver to them their tickets—to intimate to each gentleman the No. of the residence where he will find accommodation for the week; and, for the sake of easy reference to these and to the several section-rooms, as well as to the various places of public resort which will be thrown open to strangers at that time, a small plan of the town will be engraved on the back of the tickets. Ordinaries will be provided on an extensive scale for the members; and due care will be had that private parties do not interfere with them. Such arrangements as are above alluded to will, no doubt, enable the local council to give full effect to their wishes, in affording to the Association that reception which it merits, and in maintaining the character of the town for public spirit and hospitality."

#### LITERARY AND LEARNED.

##### INDIA.

THE Annual Report of the last Anniversary of the Royal Asiatic Society contains so much matter of deep interest to our Eastern empire, that we are induced to make an epitome of the leading points for more general circulation, both in England and India.

The continued prosperity of this Institution is a subject of congratulation to the public; and a new feature, the formation of a Committee of Agriculture and Commerce, under the presidency of Sir Charles Forbes, gives promise of important future usefulness. Its labours are addressed to the obtaining of a more perfect knowledge of Indian products, the introduction of such as are likely to be beneficial into this country, and the interchange of commodities suited to the wants of both.

The Right Hon. Sir Alexander Johnston, as chairman of the Committee of Correspondence, entered into a detailed statement of its operations, of which comprehensive and able *exposé* we make the following abstract:—"The right

hon. gentleman took a view of Asia and our relations therewith, in three great divisions; "the first, that which is bounded on the west by the Mediterranean and the Red Sea; on the east by the Euphrates and the Persian Gulf; on the north by the mountains of Armenia; and on the south by the Arabian Sea. The second, that which extends from the Himalaya Mountains, north, to Point de Galle, south; and from Surat, west, to Assam, and the Chinese province of Yunnan, east. The third, that which includes the whole of China in the north, and Borneo, Celebes, New Guinea, and the other Eastern Islands, as far as Torres' Straits, and the N.W. part of Australia in the south." With reference to the *first*, he entered into an examination of "the general conviction which prevails of the necessity and practicability of establishing a direct and expeditious communication between Great Britain and British India, either through the Arabian or the Persian Gulf; and of the general belief which prevails, that the Russian government may, in consequence of the extension of its frontiers towards the sources of the Euphrates and Tigris, attempt, in the event of a future war between England and Russia, to aim a blow at the British possessions in India through the Persian Gulf." Anxious to acquire a thorough knowledge of the geography and topography of this division of Asia, he stated that the committee have "derived so much information from the surveys of the Indian navy, as to render it his duty, considering the debt of gratitude which the friends of science owe to this distinguished body of men, to allude shortly to the history of their military achievements, their maritime surveys, and diplomatic negotiations." Certainly, no body of men ever merited such compliments in a higher degree than the officers of the Indian navy, who have performed these services; and we copy with great pleasure Sir Alexander Johnston's account of them. He said that

"The inhabitants of the western coast of the peninsula of India, from Cape Comorin, south, to Surat, north, have always, from the earliest times, owing to a variety of causes, had a great propensity to piracy. In consequence of this, the Great Mogul, as long as he exercised any authority over that coast, kept up a navy, under the command of an admiral called the *Sedee*, for the protection of the trade which was carried on by his subjects between India and the Persian and Arabian Gulfs. The British government, when Bombay was ceded to Great Britain by Portugal, found it necessary to establish and keep up a navy for a similar purpose; and it expended 50,000*l.* a year upon this navy from 1710 to 1756. In the latter year the government had, upon an occasion of great political importance to the British interests in India, a full opportunity of estimating the value of the services which might be derived from this navy, it having become necessary, in consequence of the innumerable depredations committed by the pirates, and the great extent of coast which they had acquired, to annihilate the power of the celebrated pirate Angrea, who had got complete possession of all the sea-coast, 120 miles in extent, from Tamana to Bancoot, and all the inland country, as far as the mountains, which, in some places, are thirty, in others twenty miles from the sea-coast. The ships and men of this navy having been employed upon that occasion, under the command of one of their own officers, Commodore James, were completely successful; destroyed the whole of Angrea's fleet; and, with the assistance of some

land troops, took his celebrated fort of Severndroog, and all his other forts; and put an end to his authority and depredations. From that time to the present period, they, as well in the capture of the island of Ternate, in the Burmese war, in the expeditions against the pirates of the Persian Gulf, as in a great many other military expeditions upon which they have been employed, have shewn the greatest promptitude, the strictest discipline, and the most undaunted courage. They have been equally distinguished by the zeal, and by the great practical and theoretical science, with which they have executed those maritime surveys by which they have been enabled, during the last forty years, to complete the most useful and valuable charts of different parts of the coasts of Asia, and of the coasts of the Arabian and Persian Gulfs. During the latter part of the last century, many of the officers gained great credit by the different maritime surveys to which their names are respectively affixed. In the beginning of the present century, Captains Ross and M'Gowan made a trigonometrical survey of the seas between the Straits of Malacca and the Yellow Sea. In 1819, in consequence of the benefit which had been previously derived, during the expedition against the pirates in the Persian Gulf, from the accuracy with which they had examined the different inlets and creeks in that sea, some of the officers were employed by the Bombay government in making the chart of the whole of the Persian Gulf, which was completed in 1828. In that year, in consequence of the desire which was evinced by the public, of having a communication between Great Britain and British India through the Arabian Gulf, Captain Elwon was employed, in the Benares, in surveying that Gulf, from the Strait of Bahelmandeh to Judda; and Captain Moresby, in the *Palinurus*, in surveying it from Judda to Akkaba and Suez: and the result of these two surveys has been published in that magnificent chart of the whole of the Arabian Gulf, of which Captain Cogan has presented a copy to the Society. In 1833, some more of the officers were ordered to survey the coast of Arabia, from the Arabian to the Persian Gulf, and thereby connect the survey of the eastern coast of Africa, made from the Cape of Good Hope to the Arabian Gulf, by Captain Owen, of the Royal Navy, with that of the western coast of the peninsula of India, made from Cape Comorin to the Persian Gulf, by the officers of the Bombay Marine; and between eight and nine hundred miles of the coast of Arabia have already been surveyed by them. In the same year, Lieutenant Wellsted was employed in surveying the Island of Socotra; and his chart, and his account of that island, copies of which are published in the *Journal of the Geographical Society*, do the highest honour to his talents and to his scientific acquirements, and afford the public a proof of the advantage which they have derived from the employment of such an officer on so important a service. Many of the officers of this navy have availed themselves of the opportunities which their profession has afforded them, of acquiring a knowledge of the customs and interests of the different native chiefs on whose coasts they have been employed. Captain Cogan has particularly distinguished himself by his knowledge of the territories and of the interests of the Imâm of Muscat; and by establishing an intimate alliance between that chief and Great Britain. He, at the request of the Imâm, two years ago, brought to England the *Liverpool*, of 74 guns, as a present from the Imâm to the king of Great Britain; and,

by command of his majesty, last October, took back one of the finest of the royal yachts as a present from his majesty to the Imâm. This officer, while he was in England, having given the committee much useful information relative to the countries and people under the authority of the Imâm of Muscat, and to the protection and encouragement afforded by the Imâm to arts and sciences, the Society, on the recommendation of the committee, nominated that chief one of its honorary members, and sent him, by Captain Cogan, a diploma, conferring that honour upon him. The government of Great Britain, aware of the importance of the Bombay marine, have lately extended to that navy the provisions of the Mutiny Act; have given the officers a fixed rank; have placed the whole establishment under the superintendence of one of his majesty's naval officers at Bombay; and have changed the name of the service from that of the Bombay Marine to that of the Indian Navy. Under all these circumstances, I can have no doubt that the Society must be, as the Committee of Correspondence is, convinced that the Indian Navy is, at the present moment, not only one of the most important departments of the military and civil services in British India, but also one of the most powerful engines which can be employed by the Society for procuring information relative to Asia, and for diffusing amongst the people of that division of the globe, the arts, the sciences, and the civilisation of Europe."

With regard to the second division of his subject, the Right Honourable Chairman directed attention to the approximation between the countries which would be effected by opening a direct communication through the Arabian and Persian Gulf; colonising India by a great body of Englishmen; elevating the Indian population in moral and political feelings; and, lastly, "the measures which must, sooner or later, be adopted by the British legislature for rendering Great Britain independent of foreign countries for cotton and silk, by getting those articles from British India." With a view to these changes, he said, the committee had "taken steps for obtaining accurate information, from genuine Hindu sources, relative to the general history, laws, moral principles, arts and sciences, of the Hindus of India; for establishing literary societies amongst the Hindus; for completing, through them, with the assistance of the local governments, such parts of the Mackenzie Collection as are still incomplete; for procuring, from the East India records in this country, all such reports as can throw light upon the ancient laws, usages, and customs, which, at the time each province was annexed to Great Britain, prevailed amongst the Hindus of that province; for ascertaining the genuine opinions of the Hindus upon all questions of religion, morals, metaphysics, laws, and government; for procuring returns of the statistics of British India from the Bengal, Madras, and Bombay governments; for arranging such returns according to the plan adopted by the French government, in 1802; for procuring all the observations which have been made, either in favour or against the continuance of the permanent system as to lands in India; for collecting information from every part of India relative to the growth of cotton, and the propagation of the silk-worm, for the first of which articles Great Britain is at present dependent upon the United States, and for the second of which upon France and Italy, instead of deriving both, as it is believed she may do, from British India, and thereby circulating amongst her own sub-

jects, in her own territories, that portion of her capital which she now circulates for those articles amongst foreigners in foreign countries."

Among the most interesting topics to which he alluded was the revival, at Madura, of "the ancient Hindu college, which is supposed to have had so great an influence upon the education and character of the Hindus in the southern peninsula of India, from the third to the tenth century of the Christian era."

In a note to his Report it is stated, that "in consequence of the influence which was exercised by this college, for seven centuries, over the Hindus in the southern peninsula of India, the celebrated Jesuit missionary, Robertus di Nobilibus, who resided at Madura in the seventeenth century, and the equally celebrated Jesuit missionary Beschi, who resided at Trichinopoly in the eighteenth century, both formed plans for reviving it; but, owing to the dissensions in their order, were unable to carry them into effect. The father of Sir Alexander Johnston, and the late Colonel Mackenzie, who resided at Madura in 1783, having procured an account of the ancient college, and copies of the plans of Robertus di Nobilibus and Beschi, in that year formed a plan of their own for the revival of this college; and Colonel Mackenzie, who was an officer of the engineers, and who was then superintending the building of the house for Mr. Johnston, which is known at Madura by the name of Johnston House, and which is now the property of Sir Alexander Johnston, at the request of Mr. Johnston, laid out this house in such a manner as to enable Mr. Johnston, whenever an opportunity might offer, to convert it into the Hindu college which he had planned. No such opportunity, however, occurred during the lives of Colonel Mackenzie and Mr. Johnston; but as the house is still the property of Sir Alexander Johnston, he has offered to make over all right which he has to it, according to the original plan of his father, to any individual or society who may agree to carry that plan into effect; and he is now in communication with a society abroad, who have the intention of sending out to Madura six men, eminently distinguished in different branches of science, for the purpose of establishing themselves at Madura, educating the Hindus of that part of India, and circulating amongst them the arts and sciences of Europe."

On the subject of the third division, the following circumstances were related, and possess much commercial interest.

"The first, that of the frontiers of the British possessions in India having been recently extended, partly by conquest, partly by acquisitions obtained by treaties, to the neighbourhood of the province of Yunnan, the western province of China. The second, that of the discovery which has recently been made, that the tea-plant is growing in a tract of country extending 300 miles within the British territories. The third, that of British traders having been enabled, in consequence of the opening of the trade with China to all British subjects, to visit parts of that empire which were never visited before by British subjects, and to become better acquainted than they formerly were with the produce of the different islands in the Eastern Archipelago, and with the various wants of their inhabitants. With a view to these circumstances, the committee have taken measures for procuring all the valuable information which is preserved in the archives of the Jesuits, at Naples, Rome, Genoa, Venice, Paris, Madrid, and Lisbon, respecting Upper and Lower Assam, Munipore,

Bong, the north-east parts of the Burmese empire, Laos, Cambodia, Cochin-China, and all the western provinces of China; for calling the attention of the British public to the moral, political, and commercial importance of the Anglo-Chinese college, established at Malacca by the late Dr. Morrison, and so liberally supported by Sir George Staunton; for encouraging the Rev. Mr. Gutzlaff to proceed in his very interesting inquiries relative to the history, literature, and science of China, to the practice of medicine in that country, and to the different idioms which are spoken by the people of Japan, who inhabit the coasts of that empire; for acquiring a knowledge of the island of Quelpert, which, from its local situation, is of as much importance to those who wish to carry on a trade with Japan and Corea, as the island of Singapore is to those who wish to carry on a trade with Siam and Cochin-China, on the one side, and all the islands of the Eastern Archipelago on the other; for having translations made from the Dutch into English of all the papers in the Dutch records of Ceylon, Cochin, Negapatnam, and Malacca, which throw any light upon the history of the islands in the Eastern Archipelago, and upon the trade which was, and is still, carried on between the Dutch settlements and those islands; and for obtaining from Mr. Earl,—a gentleman whose observations as to these islands, and the policy which the British government ought to observe with respect to their inhabitants, are of so much value,—the information which he collected during the recent voyages which he made to Borneo, and many of the islands in the Eastern Archipelago."

*Inter alia*, "At Calcutta, the improved system of education which has been introduced amongst the natives; the number of useful works on science and literature which have been translated from the English into different Oriental languages; the variety of newspapers, in English and in the native languages, which are circulated through the country; and the frequent public meetings, and public discussions, which take place upon subjects of great public interest, have gradually weakened the prejudices which prevail amongst the natives against coming to Europe; and must ultimately induce them to follow the examples set them by the celebrated Brahmin, the late Rammohun Roy, and the Mahomedan Prince Jamh-ud-din, of visiting England themselves, of becoming acquainted, upon the spot, with the nature and effects of all its political institutions; acquiring the means of exercising a direct influence upon the government of British India, and thereby protecting the rights and privileges, and promoting the local interests of themselves and their countrymen. At Madras, the natives, by forming a Hindú Literary Society at that place, shew the desire they feel to acquire knowledge, and to promote the researches of this Society, by inquiring into the history, religion, laws, architecture, and agriculture, of their country."

A remarkable notice is taken of the prince we have just mentioned:—

"After visiting different parts of England, Scotland, and Ireland, and obtaining a knowledge of the agriculture, manufactures, and statistics of the country, he has become a proprietor of East India stock, and thereby acquired a right of exercising an influence by his vote, over the British government of India. The history of this prince's family shews the great changes which have taken place in India within the last fifty years. Hyder Ali, the grandfather of the prince, was once so powerful a chief, that in the years 1781 and 1782, some

of his troops were so near Madras as to render it unsafe to reside in any of the garden-houses near Fort St. George; and Lord Macartney, the then governor, and his private secretary, the present Sir George Staunton's father, derived great credit from being able to get him to conclude, in 1783, that treaty, in allusion to which, the portrait of Lord Macartney, and Sir George's father, now in the present Sir George Staunton's possession, was painted. Scarcely twenty years afterwards the British army succeeded in annihilating altogether, under his son Tipoo, Hyder's dynasty; and Prince Jamh-ud-din, the son of Tipoo, and a pensioner of the British government, is now in England, and qualified to exercise, as a proprietor of East India stock, a greater influence over the British government in India, than his grandfather, in the plenitude of his power, had ever exercised."

The Report concludes by noticing "the liberal and enlightened conduct of the foreign merchants at Canton and Macao, as well of those who are subjects of the United States, as of those who are subjects of all the different sovereigns of Europe, in unanimously resolving to subscribe a large sum of money, for erecting a monument in honour of the memory of the late Captain Horsburgh, shews the estimation in which they hold scientific acquirements. \* \* The person to whom the honour is paid, is one who left his home in Fifeshire as a cabin-boy, who, having been employed as a sea-faring man in the Indian seas, was wrecked between Batavia and Ceylon, on the Island of Diego-Garcia; and was, in consequence of this misfortune, first led to make those valuable observations, and to collect those valuable materials, from which, with the assistance of Sir Charles Forbes, and his other friends, he afterwards published that magnificent collection of charts, which is known by the name of the 'Indian Pilot.'"

With this we close our abridgement, and have only to express our hope that these enlightened inquiries and designs may be followed up with the vigour they deserve, till both England and India rejoice in the fruits they must, at maturity, produce.

*Hindustani Literature.*—It has been generally supposed that there exists not a literature in the Hindustani language, or, at least, that the number of authors who have chosen it as the vehicle of their thoughts is extremely small. The study of the language has, in consequence, been, with a few distinguished exceptions, left to those to whom it was an object of importance to possess the power of oral communication with the natives. Perhaps the little attention with which it has been met from professed scholars may be traced to the somewhat premature judgment passed upon it by Sir William Jones, who, before he had turned his attention to the subject, pronounced it a "vulgar jargon"—a judgment which, we believe, he subsequently found reason to reverse; as some translations of his from that language (if, indeed, he has not left an express testimony in its favour) virtually tend to shew. The industry and learning, however, of a foreigner, Mons. Garcin de Tassy, one of the professors at the Bibliothèque Royale of Paris, will set this matter in a new light to us Englishmen; who, considering our facilities of communication with India, and our interests there, might be expected rather to enlighten foreigners on such a subject, than to be indebted to them for our information. That gentleman has, without enjoying the advantage of a residence in India,

collected, from Oriental sources, biographical notices of nearly *seven hundred* Hindustani authors, with numerous extracts from their works. Mons. Garcin is at present in London, for the purpose of prosecuting his researches at the East India House, the British Museum, and in the libraries of private collectors, previous to the publication of his "History of Hindustani Literature," which will embody the results of his inquiries, and which may be shortly expected to issue from the Imprimerie Royale of Paris.—*From a Correspondent and Constant Reader.*

#### FINE ARTS.

MR. SWANDALE'S PORTRAIT OF THE QUEEN, Great Russell Street, Bloomsbury.

WE have had much pleasure in looking at a whole length picture, about half the size of life, of our youthful and beloved sovereign, painted by Mr. Swandale. The artist has not had the advantage of a sitting; but has so ably availed himself of frequent opportunities of being near her majesty, that the portrait not only bears, what, under the circumstances of the case, may be considered a surprising resemblance of the illustrious original, but is divested of that formal air which too frequently accompanies pictures painted from the life. The architectural and other accessories are executed with great care and skill.

#### NEW PUBLICATIONS.

*Ryall's Portraits of eminent Conservative Statesmen.* No. V. Ryley and Co.

WE have, in the present Number, portraits of "The Right Hon. the Earl of Harrowby," from a picture by Madame Meunier; "Sir Robert Fitzwygram, Bart." from a picture by T. Phillips, R.A.; and "Mr. Sergeant Jackson, M.P." from a drawing by G. Richmond: the first engraved by H. B. Hall; the last two by J. Brown. They are all animated and faithful resemblances.

Although the letter-press consists of six more pages than usual, yet it is stated in a notice prefixed to the number, that "the necessary length of some of the memoirs, made it impossible to insert entire that [those] of the Marquess of Londonderry and the Earl of Harrowby." As a specimen of the ability and spirit with which the memoirs are written, we will quote the character of Mr. Serjeant Jackson:—

"With respect to the personal appearance of Sergeant Jackson, it may be said, that his countenance is intellectually severe in its outline, but its expression is kind and benignant. His style of oratory is simple and concise, and strictly free from rhetorical artifice. Preserving, at all times, a most courteous demeanour, he never hesitates to speak in plain terms the plain truth; and there is no gentleman in the House of Commons less liable to be driven from his purpose by threats, or deterred by invective. This his opponents have found, and he is, consequently, listened to with attention, although, on some subjects, with evident uneasiness. He states his own case in a manly manner, and, if possible, in a style still more manly, the case of his adversary. Attempts, however, from whatever quarter they may proceed, to mislead by garbled accounts, or divert by sophisms, find in him a remorseless and unrelenting foe. Quick to detect a fallacy, he is prompt and decisive in exposing it; and although the House of Commons may boast of orators more florid in their style, we very much doubt whether it has one more uniformly argumentative."

The following is a very curious genealogical

fact respecting the family of Loftus, connected by blood with Sir Robert Fitzwygram:—

"Margaret Loftus was born at Loftus Hall, in 1670, and died, as Mrs. Boyd of Rossare, in 1770, at the great age of 101; the two lives (namely, her own and her grandson's) forming a link from the reign of Charles the Second to his late Majesty William the Fourth, a period of one hundred and sixty years, including nine reigns, and exceeding, by ten years, the time mentioned by Lord Wharndcliffe, in a note to his edition of 'Lady Mary Wortley Montague's Letters,' where it is stated that her ladyship and her granddaughter, the Lady Elizabeth Stuart, now formed a link from King William the Third to his Majesty William the Fourth, a period of nearly one hundred and fifty years.

**Historical and Literary Curiosities.** Engraved by Charles John Smith. No. VI. Pickering. THIS is really a curious and interesting publication, attractive equally to the antiquary and to the man of general taste and information. Among the most striking of the plates in the present number are—"The Pulpit of John Knox, in the parish-church of St. Andrew's, in the county of Fife;" a "Representation of the carved Cassolette made from the wood of Shakespeare's Mulberry-tree, at Stratford-upon-Avon, and presented to David Garrick, by the Corporation of the Borough, at the Shakespeare Jubilee;" and "Two illuminated Paintings of the sacred Furniture and Vessels of the Tabernacle of Israel, executed by a Spanish Jew in the fifteenth century."

**Engravings from the Works of the late G. S. Newton, R.A.** Part II. Hodgson and Graves.

THREE well-known and justly admired productions of this able and lamented artist's pencil are here presented to the public. "Abbot Boniface," engraved by J. Egan; "The Deserted," engraved by James Scott; and "Portrait of Mrs. Lister," engraved by G. H. Phillips. They exhibit the art of mezzotinto engraving in its perfection.

**The Daughter.** Painted by E. Prentis; engraved by J. C. Bromley. A. Graves.

ONE of those scenes of domestic and moral enjoyment by which this country is especially distinguished. It represents a blooming and modest girl, reading the Bible to her attentive and admiring parents. This interesting print does credit to the feelings as well as to the talents of the artists who have concurred in its production. Burns has furnished the appropriate motto to it:—

"So thou, sweet rosebud, young and gay,  
Shalt, beauteous, blaze upon the day,  
And bless the parents' evening ray,  
That watch'd thy early morning."

#### ORIGINAL POETRY.

SIN.

WHEN Sin of Knowledge born, first raised her head,  
Scarce clad in garb of skins, she thrud her way  
Through Eden's bowers, and made her lonely bed  
Near to a murmuring river, which did stray  
Between its grassy banks. There did she nestle,  
Hiding her hideous features from the sun;  
For she with Shame and Sorrow had to wrestle.  
They conqering, earth had been but half undone.

But she was victor. Then, her brow adorning  
In gayest wreaths, she ventured forth to bask  
In open sunshine, her first blushes scorning,  
And far behind her threw her speckled mask.

Since when, in harlot robes, with poisonous breath,  
She walks the city, hand in hand with Death.

H. M.

#### MUSIC.

##### NEW PUBLICATIONS.

**The Letter.** By Samuel Lover, Esq. Duff. IT is impossible to praise this too highly, music and words are so truly exquisite: so exquisite and so touching to those who have relatives far away, that we copy them for their enjoyment.

"A small spark attached to the wick of the candle is considered to indicate the arrival of a letter to the one before whom it burns."

"Fare thee well, love, now thou art going  
Over the wild and trackless sea;  
Smooth be its waves and fair the wind blowing,  
Though 'tis to bear thee far from me:  
But when, on the waste of ocean,  
Some happy home-bound bark you see,  
Swear by the truth of thy heart's devotion,  
To send a letter back to me.

Think of the shore thou'lt left behind thee,  
Even when reaching a brighter strand;  
Let not the golden glories blind thee,  
Of that gorgeous Indian land:  
Send me not its diamond treasures,  
Nor pearls from the depth of its sunny sea;  
But tell me of all your woes and pleasures,  
In a long letter back to me.

But while dwelling in lands of pleasure,  
Think, as you bask in their bright sunshine,  
That while the lingering time I measure,  
Sad and wintry hours are mine;  
Lonely, by my taper weeping,  
And watching the spark of promise to see,  
All for that bright spark my night-watch keeping,  
For, oh, 'tis a letter, love, from thee!  
To say that soon thy sail will be flowing,  
Homeward to bear thee over the sea;  
Calm be the waves, and swift the wind blowing,  
For, oh! thou art coming back to me!"

**Know'st thou the Land: from the German of Goethe.** By Moritz Ganz. Schloss.

TRULY German. We like this song exceedingly; the change in the time and accompaniment is very pretty, and the music, in consequence of that change, fully expresses the words.

**The Goblin Quadrilles, composed for the Piano. Forte.** By Calder Campbell. Purday.

WE are pleased to see an original and a very agreeable set of Quadrilles; these are lively and showy, and, for music really to dance to, we could not recommend a better set. A waltz at the end, though rather tiresome to play, is also very pretty.

In our last notice of new music, we had intended to attach Mr. Haynes Baily's tender and pleasing song to the favourable mention of the music to which it has been set, and we now redeem our purpose, begging our readers to refer to that critique.

"Of what is the old man thinking,  
As he leans on his oaken staff?  
From the May-day pastime shrinking,  
He shares not the merry laugh:  
But the tears of the old man flow  
As he looks on the young and gay,  
And his gray head moving slow,  
Keeps time to the air they play.  
The elders around are drinking,  
But not one cup will he quaff;  
Oh! of what is the old man thinking,  
As he leans on his oaken staff?"

'Tis not with a vain repining  
That the old man sheds a tear;  
'Tis not for his strength declining,  
He sighs not to linger here;  
There's a spell in the air they play,  
And the old man's eyes are dim,  
For it calls up a past May-day,  
And the dear friends lost to him,  
From the scene before him shrinking,  
From the dance and the merry laugh:  
Of their calm repose he is thinking,  
As he leans on his oaken staff."

#### DRAMA.

\* **Haymarket.**—On Monday, Mr. Phelps made

his first appearance in the character of *Shylock*. We think Mr. Phelps has a good deal of talent, and will be a most useful actor; but he is not equal to the task of playing any character requiring so much energy, and displaying so much passion, as that in which he appeared. The great points we have been accustomed to hear were, in Mr. Phelps's hand, almost lost, and no new ones made. Still, there were touches of sweet acting in the softer parts of the play, and some pleasant tones of voice, making us regret *Shylock* had been chosen for Mr. Phelps's *début*. For the *Richmonds*, and all that class of parts, he will be a valuable accession to the London boards. Webster is the best *Launcelot Gobbo* the stage has had for many years. Mrs. Waylett has been singing some of her sweet ballads, as only she can sing them.

**Strand Theatre.**—A slight piece, called *Absent without Leave*, though supported by the versatile and imitative talents of Mr. Lionel Goldsmid, has not made any strong impression here. It has, however, run through the week; and, by way of riddle, it may be said that it still is, and is not, absent without leave.

#### VARIETIES.

**Invention of Printing.**—A grand festival has been observed at Mentz, in honour of the invention of printing. The ceremonies lasted during the 14th, 15th, and 16th of the month (August); and one of the most interesting features was the opening to the public of the monument to Guttemberg, which has just been finished by Thorwaldsen, and is stated to be a splendid work of genius. *A Te Deum*, composed by Chevallier Neukomm, for the occasion, was sung in grand choral force by above twelve hundred voices. The whole went off with great éclat.

**Railroads.**—A railroad has been opened between Paris and St. Germain, which seems greatly to delight the Parisians.

**Pitohards** have recently appeared and been taken on the Ulster coast, where they were never before seen. The shores of Cornwall and Kinsale are their usual resorts.

**The Maldiva Islands.**—Among the animals on the Maldivas are rats and tortoises. The former are very destructive to the cocoa-nuts. They run up the trunk, and introduce themselves into the nut, in which they remain as long as any of the kernel is left, and then quit for another. Sometimes accidents happen from nuts thus destroyed falling on persons passing by. The tortoise are of a small kind; they live in the tanks, and have a very offensive smell, but the flesh is white and tender. These are found only on King's Island, where they are numerous, but are not eaten by the natives. A small kind of harmless snake is sometimes found. The flying-fox is very plentiful; its body is about the same size as that of a crow. There is only one singing bird, a small one, of a black colour, called by the natives *colea*.

**Weather-Wisdom.**—The 30th most entirely fulfilled the prediction of last week; and, indeed, the whole prophecy from Saturday, till now, is a capital hit. Let us, therefore, look forward:—"Changes again about the 4th and 5th days; cloudy and gloomy; cold rains, especially on the 5th. The 6th, changeable. 7th, cloudy, showers. The 8th denotes small rain and misty air, yet windy."

**Royal Institution.**—Among the marked improvements in London, we are glad to see a renewed and handsome architectural front rearing its columns at the Royal Institution, in Albemarle Street. Behind scaffoldings, and amid all the confusion of brickwork, it is not

easy to say what the elevation will really be; but at such a glance as these allow, it seems to promise to look bold and well.

**Comic Library.**—Mr. McLean pursues his series of comicalities without a pause, and we have Nos. 7, 8, 9, and 10, spread out, with all their humours, before us. One gives useful and original receipts, such as sweeps in a well-dressed crowd—"a very good black for cottons, silks, &c." The next illustrates courtship, by many ludicrous figures and situations. The third is a comical guide to the arts and sciences, such as a patient fisherman, "Angle," and a cub of a boy at it in a trough; "Try-angle," the rods and lines demonstrating the geometrical problems: and the last, "Adages for all ages," *ex. gr.* "a wise man aims at nothing out of his reach,"—a Cockney firing at cocks and hens on a dunghill, with a blunderbuss.

### LITERARY NOVELTIES.

Except the 24th, 25th, and 27th, generally cloudy, with frequent showers of rain; a violent storm of thunder and vivid lightning, accompanied with heavy rain, from about 11 A.M. till about 4 to 2 P.M. on the 26th, and thundering at times during the afternoon of the 30th. Rain fallen, 2.25 inches, of which 1.2 inch fell during the storm of the 26th.

Reminiscence. CHARLES HENRY ADAMS.  
Latitude... 51° 37' 32" N.  
Longitude... 3 51, W. of Greenwich.

### TO CORRESPONDENTS.

In our Review of the Memoir of Mr. Thelwall, we were not aware that his widow ("the Editor?") was a second wife, and much younger than the lady we supposed. R. W. T. will find a letter at our office. We like E. C. much; and if he will allow us to make a very few verbal changes, we will not say corrections, his contributions shall be welcome to our columns.

### ADVERTISEMENTS,

Connected with Literature and the Arts.

### NOW OPEN.—DIORAMA, REGENT'S

PARK.—New Exhibition, representing the interior of the Basilica of St. Paul, near Rome, before and after its Destruction by Fire; and the Village of Aiguine, in Piedmont, destroyed by an Avalanche. Both Pictures are painted by Le Chevalier Bouton.

Open daily, from Ten till Five.

### VIEWS IN BARBARY.

Money Advanced upon Duplicate Portions of Booksellers' Stock, upon Libraries, and on Literary Property in General.

### MUSIC.

### SACRED MELODIES. The Words

selected chiefly from the Hymns of Bishop Heber; composed and dedicated to the Rev. H. Harcourt.

By Mrs. BARNETT LOWNARD.

Book I. Price 10s. 6d.

Sold by Duff and Co. 65 Oxford Street.

"The collection consists of six pieces, adapted for a single voice, with an accompaniment, and most of them harmonised for four voices. We conscientiously recommend these 'Sacred Melodies,' as being extremely well calculated for private performance: for a devotional feeling pervades the words; and the music is written with a corresponding one."—*Morning Post.*

"The subjects are not only graceful in themselves, but the rhythm has, in every instance, been carefully preserved, as well as the just accentuation, and meaning of the words."—*True Sun.*

### BOOKS IN THE PRESS.

### THE NATIONAL MAGAZINE,

price 2s. 6d. contains:—The Student, and Extracts from Surgeon's Diary—Modern Improvements—Frank Woolly—Character of Panth—The Chute and Michael Doyle—Reviews of Books, &c. and two splendid Illustrations by Brandard.

"It is got up in the best style, both as a book and as a specimen of literature, and we have no doubt, of its very soon becoming highly prized."—*Sheffield Iris.*

Published by W. Edwards, Ave Maria Lane, London.

### THE NEW COMIC PERIODICAL WORK,

EDITED BY "BOZ."

AND ILLUSTRATED BY GEORGE CRUIKSHANK.

The September Number (embellished with Two Humorous Illustrations by George Cruikshank) of

Translated by LEONARD HORNER, Esq. F.R.S.

"\*The author of the valuable Reports on Public Instruction in Prussia visited Holland in the autumn of last year, for the purpose of inquiring into the State of the Schools and Universities of that Country, and a volume, containing the results of his Inquiry, will shortly be published, in Paris."

John Murray, Albemarle Street.

Price 5s. Illustrated with a Plate and numerous Woodcuts, No. XXXVIII. of

## THE QUARTERLY JOURNAL of AGRICULTURE, and the Prime Essays and Transactions of the Highland and Agricultural Society of Scotland.

This Number will be found to contain some articles of high and general interest, such as—On the present Agricultural Condition of Ireland—A Continuation of a Graphic Account of the Agriculture of Hindostan—Thoughts on Draining, as the Surest Means of imparting to the Soil the Benefits of Fertility—On the Preparation of Orchards—On the Diseases incident to the most usually Cultivated Plants—On the Unequal Assessment for Public Burdens on Land in Scotland—On the Preparation of Live Stock and Meat in Reference to their Exportation by Steam-vessels—On that general subject of interest at the present moment, the Draining of Land by Tiles—And on the Native Pine Forests of Scotland.

William Blackwood and Sons, Edinburgh; Thomas Cadell, London; and Wm. Curry and Co. Dublin.

## CHAMBERS'S EDUCATIONAL COURSE.

Edited by WILLIAM and ROBERT CHAMBERS, Conductors of "Chambers's Edinburgh Journal."

The success which has attended the efforts of Messrs. Chambers in the business of Popular Instruction, has induced them to undertake the duty of supplying a series of Treatises and School-Books, constructed according to the most advanced views of Education, both as a science and an art, and answering, in its parts and ultimate general effect, to the demands of the age. Their Course will, as far as possible, embody the code and materials of Elementary Education—Physical, Mental, and Intellectual. Some of the volumes will be suited for the guidance of parents and teachers; others will be adapted for the private study of youth of both sexes; and the remainder, or larger number, will possess the character of school or text-books. The price at which the various books will be issued, will, in general, not be above a half, and frequently not above a quarter, of the price usually charged for works of instruction, one of the chief motives of the Publishers being to bring the means of education within the reach of the most humble classes of Society.

Of this Series of new and cheap Publications, the following have now appeared:—

For Use in Schools and for Private Instruction.

Introduction to the Sciences, price 9d. sewed, and 1s. cloth boards or bound. Of this Work Twelve Thousand Copies have already been sold, and it is not adopted in most Schools conducted on an improved plan of education.

Natural Philosophy. First Book. Laws of Matter and Motion. Price 6d. sewed, and 8d. cloth boards or bound.

Rudiments of Chemistry. By Dr. D. B. Reid, Lecturer on Chemistry, Edinburgh. Price 1s. sewed, and 1s. 6d. cloth boards or bound.

History and Present State of the British Empire. [This Work includes the History of England, Scotland, and Ireland, in one Narrative.] Price 2s. sewed, and 2s. 6d. cloth boards or bound.

History of the English Language and Literature. [This Work presents an Account of all the principal British Authors and their Writings, from the Period of Chaucer till the present time, and is the only work of the kind.] Price 3s. sewed, and 3s. 6d. cloth boards or bound.

Principles of Elocution, in which the Subjects of Articulation, Inflection, Modulation, and the Measure of Speech, are familiarly explained; to which is added, a Selection of Pieces, in the various styles of Reading, recitation, Oratory, &c. By William Graham, Teacher of Elocution in the Naval and Military Academy, and the Scottish Institution for the Education of Ladies. Price 2s. 6d. sewed, and 3s. cloth boards or bound.

Elements of Plane Geometry, according to Euclid, as improved by Simpson and Playfair, with several new Improvements and Additions. By A. Bell. Price 2s. sewed, and 2s. 6d. boards or bound. [Solid and Spherical Geometry, and Conic Sections, in the press, and will be issued at the same low price. These will form by far the cheapest as well as the most improved edition of Euclid ever published, being not above a third of what the work is usually sold for.]

Elements of Drawing and Perspective, with Directions for sketching from Nature. By John Clark, late of London. Price 1s. 3d. sewed, and 1s. 6d. cloth boards or bound.

For the Study and Amusement of Youth.

Exemplary and Instructive Biography, price 2s. 3d. sewed; 2s. 6d. plain boards or bound; and 3s. boards, gilt.

For Parents and Teachers.

Infant Education, between Two and Six Years of Age; forming a complete Directory for instituting and managing the Seminars called Infant Schools, and also for the Guidance of Private Individuals who have the charge of Children at that period of life. Price 1s. 6d. sewed, and 2s. cloth boards.

As Teachers and others may not be aware of the extent to which this Series of Publications will be carried, Messrs. Chambers beg to inform them that the following Books for Schools will, amongst others, be prepared and issued.

A Primer, and a Second Book of Reading.

A System of English Grammar, along with Instructions in Composition.

A System of Arithmetic, Theoretical and Practical.

Lessons in Writing or Penmanship.

Elements of Geography, Mathematical, Political, and Statistical, with Maps of the different Countries.

Elements of Geology, according to the latest Discoveries.

Elements of Astronomy, and the Use of the Globes.

Ancient History, including the History of Greece—its Philosophy and Literature. In 1 vol.

Modern Universal History—France, Spain, Italy, Germany, Prussia, Russia, Holland, and other Nations of Europe; also, United States of America. In 1 vol.

(History and Present State of the British Empire is already published, and completes the Series of Histories.)

Natural Philosophy, or Physical Sciences, in about Six or Eight separate small Books. Two Books are already published—Matter and Motion, and Chemistry.

A System of Algebra, suited to meet the latest Advances in Science.

Practical Mathematics: Mensuration, Land-Surveying, Gauging, Navigation, and other Branches suited for the Instruction of Mechanics and others.

Published by W. and R. Chambers, Edinburgh; and William Sorr and Co. London.

Schoolmasters and others may be supplied with any quantity of Copies, or with any Work separately, by every Bookseller in the Country.

Specimen Copies of the Works are to be seen at the Shop of every Agent for the Sale of Chambers's Journal.

## THE PERILS of AUTHORSHIP: an

Exposé, detailing, at full length, all Matters and Secrets connected with Books and Bookellers.

By an Old and Popular Author.

4th edition, 1s. 6d.

"\*The Public are informed that this work will always be kept in Print, notwithstanding the vigorous attempts of the 'Trade' to suppress it."

Published for the Author, by W. Kidd, 7 Tavistock Street.

Where may be had,

Kidd's How to enjoy Paris. 3d edit. 1s. 6d.

Kidd's How to enjoy Boulogne. Ditto, 1s. 6d.

Kidd's Mirror of Literature, Wit, and Learning. 18th edition, Two Parts, 1s. 6d. each.

Kidd's Universal Pocket Dictionary. 12th edition, Two Parts, 1s. 6d. each.

Also,

W. Kidd's New Catalogue of more than 200 Popular Books.

"\*Caution to Collectors, the Public generally, and Persons residing in the Country more particularly."

It being now an invariable practice with a large Establishment in the immediate vicinity of Paternoster Row, to answer, W. Kidd's Publications, "Out of Print," "No Jack Books," &c. &c. he is, in self defence, obliged to give publicity to the fact, and thus to answer his Country and other Correspondents, who complain, with justice, of the "sneaking system" so unblushingly and unjustifiably practised.

Butterflies and Moths.

Price 6s. in cloth.

The Natural History of British Butterflies, illustrated by upwards of 150 Specimens, accurately and beautifully coloured.

Also,

The Natural History of British Moths, Sphinxes, &c. Price 6s. with very numerous coloured Plates.

"\*The above Volumes form a complete Manual of British Butterflies and Moths, containing between two and three hundred Figures, and having the English as well as the scientific names given."

The Natural History of Foreign Butterflies. Price 6s. with upwards of 70 coloured Specimens.

The Volumes may also be had in silk and morocco bindings, price 7s. 6d. or 8s.

S. Highley, 39 Fleet Street, London; W. H. Lizars, Edinburgh; and all Booksellers.

8 New Burlington Street, September 2.

MRS. S. C. HALL'S NEW NOVEL.—In 3 vols. post 8vo.

### UNCLE HORACE.

By the Authoress of "Sketches of Irish Character," "The Buccaneer," &amp;c.

### THE SPAS OF GERMANY.

By Dr. GRANVILLE, Author of "Travels to St. Petersburg," &amp;c. In 2 vols. 8vo. with Thirty-Eight Illustrations.

"The mineral waters of Germany have long been resorted to by such vast numbers of invalids and travellers from this country, that it is singular that no work has been published, until the one now before us, describing these Spas in a scientific manner. The reader will find in Dr. Granville's book a fuller, a more minute, and a more practical account of the German mineral springs than has ever before been presented to the public, and conveyed, too, in a popular and pleasing form; so lively and amusing, indeed, are the volumes, that the author actually apologises, in his preface, for the light and varied style in which he has treated the subject."—*Caledonian Mercury*.

MRS. GORE'S NEW NOVEL, in 3 vols. post 8vo.

### STOKESHILL PLACE; OR, THE MAN OF BUSINESS.

By the Authoress of "Mrs. Armytage," "Mothers and Daughters," &amp;c.

"These volumes contain some of the most exquisite sketches of fashionable life we have yet seen, even from the pen of Mrs. Gore."—*Examiner*.

### TRAVELS IN CIRCASSIA, KRIM TARTARY, &c. IN 1836-7,

Including a Steam Voyage down the Danube. By EDMUND SPENCER, Esq.

In 2 volumes 8vo. with Map and numerous Illustrations.

"Mr. Spencer's entertaining work is likely to be the most attractive book of travels of the season. He has penetrated into a country quite unknown, even to English travellers, described only by Dr. Clark on hearsay, and by Pallas and Klaproth with evident injustice."—*Times*.

### MISS PARDOE'S CITY OF THE SULTAN;

In 2 vols. 8vo. with numerous Illustrations, 32s. bound.

"We have followed Miss Pardoe, at once thrilled and excited, from the regal hall to the mad-house—from the marble-lined mosque of St. Sophia to the boatman's mud-built hovel—from the subterranean cisterns of Constantinople to the cloud-enveloped summit of Mount Olympus. In her delightful society we have feasted with pashas and conversed with patriarchs, gossiped with deep-eyed Circassian beauties, and bowed beneath the spell of Georgian loveliness; we have loitered away the sunny hours of summer in the 'Valley of Sweet Waters,' and galloped over the plain of Broussa. Miss Pardoe has left nothing unobserved, and she has produced a work as instructive and amusing as it is curious."—*Court Journal*.

### CAPTAIN ALEXANDER'S NARRATIVE OF A VOYAGE AMONG THE COLONIES OF WESTERN AFRICA,

In the Flag-Ship *Thalia*; and of the Kaffir War of 1836.

In 2 vols. 8vo. with Maps and numerous Plates, by Major C. C. Michell, K.H. 32s. bound.  
"A most interesting account of the Colonies of Western Africa. Very little is known of the new settlements on the African frontier; and it is a matter of surprise to us that no work, except Mr. Martin's, has been hitherto published descriptive of the establishment and rapid rise of these acquisitions. The volumes before us contain a great deal of valuable and interesting intelligence, and a very animated description of the proceedings of the British and native forces."—*John Bull*.

### CAPTAIN MARRYAT'S NEW NOVEL,

SNARLEY YOW; or, THE DOG FIEND. In 3 vols. post 8vo.

"Not inferior to any of Captain Marryat's previous works, 'Peter Simple' alone excepted. It is grotesque and humorous from beginning to end."—*Athenaeum*.

"This is a work in a completely new style, and full of spirit it is. The dash of historic character gives great effect to the wild and animated narrative."—*Literary Gazette*.

PORTRAIT OF THE QUEEN.—The September Number of

### COLBURN'S NEW MONTHLY MAGAZINE AND HUMOURIST,

Edited by THEODORE HOOK, Esq.

Is embellished with an ORIGINAL LIKENESS OF HER MAJESTY, as she appeared on the day of Proclamation, and contains, among other Contributions by Distinguished Authors—

The Gurney Papers, by the Editor.

Lunacy in France.

Confessions of Ralph Restless, by Capt. Marryat.

Visit to the Salt-Mines of Saltsburg.

The Plagues of Popularity.

Ben Jousen, by the Author of "Glances at Life."

### REVIEW OF NEW BOOKS.

#### ARISTOTLE'S POLITICS.

*Politique d'Aristotle, traduite en Français, d'après le Texte collationné sur les Manuscrits et les Editions Principales.* Par J. Barthélemy-St. Hilaire. 2 tomes. Paris, 1837. Imprimé par Autorisation du Roi, à l'Imprimerie Royale; London, Kernot.

In one of Lord Chatham's admirable letters to his son William, while at Cambridge, he writes, "Consider, there is but the Encyclopædia: when you have mastered that, what will remain?" There has never, perhaps, existed but one individual to whom this remark could have been applied in its literal signification. Aristotle alone seems to have entered upon every possible path of science and philosophy, with the same extraordinary success; and after his all-comprehensive and accurate investigations, must have sighed, like his royal pupil, for a fresh world to conquer. It is not our intention, on the present occasion, to enter into a discussion upon the nature and character of all the works of this philosopher which have reached us, but to confine ourselves to a slight sketch of his "Politics;" before which, however, a few observations on the history of philosophy among the Greeks, may not be misplaced.

It is to the genius of Socrates that philosophy may be said to owe its origin. He it was who first demonstrated that the "proper study of mankind was man;" who prescribed laws and regulations to the hitherto uncontrolled range of our ideas and meditations; and who, while he taught his disciples the nature and composition of the intellect, acquainted them with methods to govern its most subtle and delicate operations, and to avail themselves of its powers to their utmost extent. No writings were ever bequeathed to posterity by this mighty master, but his doctrines shine through the imperishable works of Plato and Aristotle, who carried out his principles, and who brought to the task of completing his glorious undertaking, souls as lofty and capacious as his own. It was the province of Plato to form a psychology, to investigate the properties and accidents of the understanding, and trace to their source and resting place the conceptions of the imagination. In this office he entered with a spirit sympathising with its pursuit, and identifying itself with the character of its researches. He created a world of ideas for himself from which he never departed; and this creation he embellished with all the colouring bestowed by a vivifying and poetical fancy. His speculations threw the first ray of light upon the infinite store of faculties and sensibilities that had, until then, lain in a species of chaos in the human mind, and exhibited man to himself, endowed with powers and abilities whose very existence had previously been unknown. The soul was displayed in its highest state of perfection, capable of exercising the most elevated functions, and seeming to consist of a conjunction of pure and ethereal visions of the beautiful and the divine. This was the congenial employment of Plato, and nobly did he execute his lofty undertaking. His pupil, Aristotle, however, saw that this psychology,

instead of being the end, was only the means for further advantage. This was the immaterial spot, the *non être* of Archimedes, from whence the physical world could be moved. He proceeded from the investigation of thought, abstractedly considered, to its operations when brought into action; and passing from the demonstration of the existence of the powers of the understanding, shewed how they could best be employed and rendered serviceable. In this pursuit there was no room for those flashes of the imagination, those airy dreams, which found a kindred place in the psychological speculations of his predecessor. From the beautiful, but in some places baseless, structure of Plato, Aristotle took all that was real, and, by subjecting it to a series of close analyses in its effects and consequences, arrived at the most brilliant and important results. From his comprehensive, yet minute, inquiries upon the properties of reason, there sprang that system of logic, which will ever remain as a specimen of the profundity and acuteness of his intellect. His researches in the material world shew the same critical and analysing spirit which, at the same time, grasps the whole of any subject, however vast, and enters into its minutest details, however complicated. By the exertions of two minds of this nature, based upon the institutions framed by Socrates, the empire of reason was founded. Its nature and application, its causes and effects, were made manifest, and philosophy came forth into the world, arrayed in all its splendour, and diffusing that happiness and might which it has ever continued to confer on its votaries.

The writings of Aristotle have been referred to three heads, God, Nature, and Man. It is to the last of these that our notice is at present attracted. Man was considered by our philosopher in a two-fold capacity, as a social, and as an intellectual being. The "Poetica," and "Rhetoric," apply to him viewed in the latter light; and the "Ethics" and "Politics" (with which we are now immediately concerned) relate to him under the first-mentioned aspect. According to the Stagirite himself, the "Politics" is the most important of his works. The characteristics of his style are, perhaps, more perceptible in this treatise than in any other. His accuracy of classification, his logical and concise mode of reasoning, the methodical spirit which pervades the whole, the unembellished and simple mode of argument which true philosophy has ever since adopted,—all these qualities are conspicuously shewn in the work before us. He commences his essay by a definition of the nature of a state or political government, shewing that it is an association or partnership for the mutual benefit of the component members; and that those principles which ensure the greatest benefit to the greatest number should influence the whole body.\* He then considers which is the most likely system to produce the greatest happiness, and demonstrates that no fixed rule can be laid down, as the nature of the government must necessarily vary with the nature of the governed. The state does not influence the character of its members,

\* This has, drolly enough, been put forth as a new principle in the 19th century!!—Ed. L. G.

but the character of the members determines and disposes the state. The principle of mixed governments is, abstractedly, the best calculated to ensure happiness. Unmixed democracy will, in all probability, run into excess; and the popular feeling is precipitate in its decisions, but slow in their execution: simple aristocracy and simple monarchy, also, are prejudicial to the best interests of the country, as founded manifestly upon the injustice of the good of the few, or the good of the one, prevailing over the good of the many. That form of government, therefore, which combines and balances these three divisions, will, in all probability, be the best adapted to the purposes of a state. He traces the causes which lead to the ruin or prosperity of a government; and, in the course of his arguments, necessarily touches upon many important political questions; such as the propriety of possessing goods in common; the results of innovation in established institutions; the necessary qualifications to enjoy the privileges of citizenship; the uses of the practice of ostracism; the influence of the middle classes; the legality of slavery; the effects of education, particularly the operations of music,—a subject so intimately connected with the acute and susceptible organisation of the Greeks, but which sounds somewhat strange to our more northern ears. Our limits forbid us to commence an examination of Aristotle's tenets upon every point to which we have alluded, nor could any thing new be brought forward on subjects which have been discussed for so many centuries. We will, however, translate for our readers a passage of M. Victor Cousin, from his history of philosophy, quoted by Mons. J. B. St. Hilaire, in his eloquent Preface, as a just criticism on this great man.

"On politics there were two works by Aristotle, one of which was the exact counterpart of that by Montesquieu. The same man who had analysed so closely the internal organisation of animals, and the nature of the human intellect, carried his investigations into the structure and composition of every known government, whether Greek or barbarian. The information he obtained in this way he reduced to the most general laws of which it was susceptible, without the slightest partiality for this or that system, but with that imperturbable *sang froid* which never forsakes him. It must have been, in truth, an *esprit des lois*; but this great work we have unfortunately lost. The political treatise of Aristotle which has reached us, though in a somewhat mutilated shape, is a theory of government. The principle which should regulate a state, according to this treatise, is Utility, or, in the language of the day, Expediency. In this he differs widely from the opinions of Plato. That expediency is not altogether to be despised is not denied; but it will mislead most people, as it has misled Aristotle. The true principle of government is Justice; and though, as what is just is sometimes expedient, so, reciprocally, that which is expedient is occasionally just; yet, in endeavouring to render these terms convertible, the smallest error, in calculating what is expedient, may give rise to injustice without end. It is thus that Aristotle meets the great question of

slavery; and, by falsely applying the principle of expediency, is enabled to decide in favour of its maintenance. \* \* \* The political system of Plato is republican, but still aristocratic; that of Aristotle is more monarchical, and seems to dread tyranny less than disorder."

Mons. J. B. St. Hilaire defends him with great earnestness against the charge of partiality, either towards tyranny or monarchy, though, in our own opinion, the writer we have quoted is perfectly correct in stating that the horror of any thing approaching to confusion or anarchy is one of the most prominent features to be observed.

The character of Aristotle, as a man, as far as we can learn, was every way worthy of his high station as a philosopher. Neither his well-deserved influence at courts, nor his undisputed pre-eminence in the schools of philosophy, was productive of the slightest pride or austerity. The virtues of public and private life, which he enjoined so convincingly on others, were to be seen exemplified in his own conduct. The acquisition of truth seems to have been the only end of his labours; and nothing could ever induce him to sacrifice his conviction before the opinions of others, even though they were the most estimable and learned of his friends. "Amicus Plato, amicus Socrates, sed magis amica Veritas," are words which are still in use, and worthy of the lips of him, this inflexible philosopher, by whom they were first uttered. The Athenians, who, in their caprice, could erect statues to the men whom they had but a few years previously destroyed, were excited against Aristotle on some religious grounds; and he retired to Euboea, saying, in allusion to the fate of Socrates, that he would not let the Athenians sin twice against philosophy. The life of this truly wise man, who may take his station among the greatest benefactors of the human race, came to a close in the sixty-third year of his age; and the fable tells us that the ardent spirit of inquiry which accompanied him in all circumstances, was the cause of his death, since, being unable to account for the preternatural ebb and flow of the waters of the Euripus, he threw himself into them in a fit of mortification.

It remains for us to say a few words on the edition now before us, which is calculated, in every way, to sustain the high character possessed by our continental neighbours for classical learning and acumen. In a well-written Preface, Mons. J. B. St. Hilaire enlarges upon those topics of which we have given the outline to our readers, and presents us with an interesting sketch of the fate that Aristotle has undergone through the skill or ignorance of each of his editors or translators. The change which has been observed in the order of the books, namely, the introduction of the seventh and eighth after the third, and the placing the sixth before the fifth, is, we think, fully warranted by a close inspection of the nature and connexion of the system intended by the originator. The translation is executed faithfully, and with much spirit; and we trust that this edition will but be the forerunner of the remaining works of the author, conducted on the same principle, and illustrated with the same happiness. It is to be hoped, that this and similar publications, by affording increased facility towards a correct conception of the meaning and intentions of the original, will have the effect of rendering Aristotle, and the corresponding writers of antiquity, more generally read and appreciated. No one can quit the perusal of a work of this nature without being struck by the simplicity and total absence of all

pretence with which the highest truths of philosophy are disclosed, and the earnest desire to obtain the truth, which seems to be the sole object of the writer. In these respects we are afraid, though aware of the odium attached to comparisons, that the productions of modern political theorists and economists, when placed in competition, must appear to but little advantage. If the introduction of a more candid and single-minded style of discussion were the only benefit to be gained from a familiarity with the wisdom of the sages of old, we should consider it sufficient to compensate for the labours bestowed in its acquisition; but when, in addition to this, we reflect on the exertions which must be employed by the intellect and its consequent enlargement, and on the exercise undergone by the reason, as well in detecting the occasional fallacies as in acquiescing in the profound conclusions, of these masters of thought, we are compelled to admit, that on no books can our daily and nightly attention be with more propriety bestowed than these absorbing volumes.

*The Hunters of the Prairie; or, the Hawk Chief.* By John Treat Irving, Esq. 2 vols. 12mo. London, 1837. Bentley.

THERE is about these pages the same charm that belonged to those of the older travellers—the charm of wild adventure, and of novel scenes. Belonging to the school of Mr. Cooper, modelled obviously on his style in every way, yet the interest kept up to the last, shews that the ground is far from exhausted; and Mr. Irving carries us completely along with him. In proportion as society becomes more and more artificial, and the pathway of every individual is chalked on in the beaten track, works like the one now before us have a delight especially their own. They carry us back to those early periods, by a knowledge of which alone can we trace the efforts that civilisation has made in its progress. They gratify, too, the love of adventure almost universal to the young; and teach, too, that most useful of lessons, that we are not to measure every thing by our own standard. The Hawk Chief is a fine specimen of a race that will soon be only a tradition; and he is surrounded by a spirited group of hunters, trappers, rangers—wild inhabitants of the wildest scenes. We must premise, that an infinite variety of escapes and dangers, in which an Indian girl has taken a prominent part, lead to the following result.

"In the centre of the lodge sat a single Indian female, surrounded by a ring of warriors. Upon her the angry looks of all were riveted. It was Nahtourah: she was bound with leathern thongs. The haughtiness which at times lighted up her otherwise soft and feminine features, had disappeared, and she now seemed in the lowest and most heart-breaking despondency. Her hair was dishevelled, her features were wet with tears; not a trace of her bold carriage was left. Once, and but once, she raised her head and ran a wistful glance round the assemblage. She encountered not a face that did not scowl upon her; and, with a despairing gesture she drooped her eyes to the ground. The silence which for nearly an hour had filled the building, was now broken by the medecin,\* who slowly rose. The hush grew intense; the stillness was so wrapped, that it seemed that not a breath was drawn, though every furrowed face was kindled into excitement. The medecin cast a keen and

half-triumphant look upon the girl, then directed his attention to the assembly. 'The Pawnees,' said he, 'are sitting in council; but the places of many are empty. Where are the warriors? Ask the wolves and the ravens that are tearing their limbs, and the white man who laughs as he looks at their white bones.' The speaker paused to watch the effect of his words. A low fierce murmur sounded through the building. The medecin saw that the feelings of the warriors were with him, and seized the moment to confront his victim. 'Woman!' said he sternly to Nahtourah, 'there has been a serpent in the Pawnee village, and its bite has been full of poison.' Nahtourah raised her eyes, and murmured, scarce audibly, 'Nahtourah hears, but she does not understand. Then, let her listen. The pale faces escaped; who loosed the cords that bound them? They had horses; where did they find them?' Nahtourah was silent. 'Who has brought desolation upon the Pawnee village? Who has swept away the warriors of the tribe? Who has brought the curse of Wahconda\* upon us?' With an appearance of effort, the Indian maid calmed the emotion that agitated her. 'Will the great medecin listen to Nahtourah?' said she, in a subdued tone. 'The ears of the medecin are shut,' said the other, coldly. 'Just then the long and distant howl of wolves was heard. 'Do you hear that cry?' said the medecin, sternly. 'Tis a wolf hastening to the spot where the Pawnee is lying; his hand is still; his voice is hushed; he cannot drive away the wolf that tears his limbs: he is dead.' The girl saw that her fate was sealed. She knew that she had been the cause of disaster to the tribe. She had no defence to offer, save her love for Sharatack; and he, by some strange fatality, was absent. But the utter prostration, which at first had paralysed her energies, passed away, and her eye kindled as she tauntingly replied, 'Why is the Pawnee dead? The white man hunted him. The Pawnee fled. He turned not on his pursuer, for his arm was like a woman's; his heart was water; he was a coward.' 'He was killed,' replied the medecin, sternly. 'A warrior dies; a coward escapes.' 'A deer that runs is killed by a shaft, as well as the fierce bear that fights,' was the response of the now undaunted girl. 'There were deer among the Pawnees; they were shot in the back.' The medecin, for a moment, was silenced. But a low and fierce hiss was distinctly audible from the assembly. In the lodge were the Otos, who had mediated between them and the whites; and the open taunt thus given in the presence of these members of a rival tribe, increased the bitterness of their envenomed feelings. In the midst of the pause, an aged warrior rose. 'The maiden has betrayed her tribe,' said he; 'she has brought death among the Pawnees: let her die!' A savage murmur of assent ran through the lodge, which was succeeded by a dead stillness. At that moment there was an agitation among the crowd nearest the door. It opened, and a warrior entered and stalked to the centre. A slight exclamation of joy escaped the prisoner, for, at a glance, she recognised the proud movements and noble form of the Hawk Chief. Slowly and calmly his eye moved from face to face, until it rested upon that of the medecin. Their look met for an instant, but that of the medecin drooped and shrank from his piercing gaze. From him it wandered to Nahtourah, and its expression softened as it rested upon

\* "The medecin, a French term for physician, is a half-sacred character in an Indian tribe, supposed to heal the sick as much by incantations as by the use of simples."

• "The Great Spirit."

her. 'Why is the Indian maiden a prisoner among her own people?' said he to the medicin. 'She is a Pawnee; wherefore is she bound like an enemy? A wild beast preys not on its kind.' The medicin was aware that the assemblage was on his side, and his hardihood returned. He replied boldly: 'There is white blood in the veins of Nahtourah; she has turned from her nation, and become a pale face.' The lip of the Hawk Chief curled, as he answered, 'The great medicin sings in the ear of Sharatack; his words fall to the ground.' Speech could not have conveyed the feeling of hate and cowardice more clearly than the black scowl that swept over the face of the medicin, as he heard these words, which, in the Indian language, convey a direct accusation of falsehood. He, however, answered in those tones of moderation which are often assumed as a veil for fear. 'My brother is young,' said he; 'he speaks fast; his words come only from his mouth.' The Hawk Chief answered calmly, 'The words of Sharatack are not songs. Listen! The great medicin would have Nahtourah die. It is well. When Nahtourah dies, the knife of Sharatack shall be red with the blood of the medicin. I have spoken.' As he finished, he drew himself up, and stepped back, as if to make room for the Indian to pass forward to his victim. The medicin was irresolute; he cast a quick but keen glance round the building, to learn from the swarthy faces whether he was likely to be supported in his sacrifice. He saw with instinctive quickness, that though many of the older portion of the audience, influenced, perhaps, by his sacred character, were disposed to favour him, yet, that the bold bearing of the Hawk Chief had produced a revolution in the younger and more fiery members of the council. After pausing for a moment, he addressed the Hawk Chief:—'My brother speaks words of fire. He knows not what he says; he speaks for one who has betrayed her tribe—for one who has brought death into the lodge of the Pawnee.' The face of the Hawk Chief grew troubled. He folded his arms and bent his eyes to the ground. 'Let the medicin speak,' said he; 'Sharatack will hear.' With a look of malignant joy, the Indian priest hastened to recount the release of the whites by Nahtourah. He related how Nahtourah had guided them in their escape, and furnished them with horses. Every thing that could tend to criminate and excite feelings against her, was dwelt on by the crafty priest. The countenance of the young chief was unmoved throughout the whole recital. When it was finished, Sharatack made two steps towards the girl. 'Nahtourah!' said he, in a tone whose softness, at that moment, so strongly contrasted with the stern words lately addressed to her, that it sounded like music to her ears. The girl raised her head, and fixed her eyes fondly on his face. 'Did Nahtourah cut the bonds of the white man?' asked he: 'did she set the pale face free?' Nahtourah's head sank heavily upon her breast, and she made no reply. 'Speak, Nahtourah!' said Sharatack, somewhat sternly; 'are the words of the medicin true?' Nahtourah sank at the feet of her interrogator, as she murmured, 'They are true!' The Hawk Chief drew back, apparently unmoved; but one might have observed a momentary tremulousness of features, that instantly disappeared. He stood in silence, with his gaze bent steadily on the prostrate girl. He was aroused by the voice of the medicin. 'Sharatack has heard he maiden; shall she die?' 'Sharatack was a prisoner,' replied the Indian gloomily. 'The sake was waiting for him—Nahtourah risked

her life to set him free.' 'Who placed the snare that caught Sharatack?' demanded the medicin. 'It was Nahtourah! Who has robbed us of warriors strong in fight, and voices wise in counsel? Nahtourah! What says the hawk of his tribe? shall she not die?' The frame of the young chief was for a moment convulsed; but in an instant his expression changed to fixed calmness, as he replied, 'The medicin is right; let her go!' Nahtourah had raised her eyes to the face of the speaker; but when she heard these words of condemnation, she sank down, as if smitten by some sudden and overpowering blow. 'She will die; Nahtourah will die!' murmured she; 'Sharatack has spoken—she will die!' The medicin approached her. 'Has Nahtourah heard the words of the council?' demanded he. 'She has heard enough!' replied the girl. 'She has heard the words of Sharatack, and she will die!' 'Tis well,' replied the medicin coldly; 'the dead are waiting for her.' The Hawk Chief had drawn back as the medicin approached his victim. The form and features of the young warrior were muffled, except the upper part of his face; but from above his robe, his eyes were bent upon the medicin like coals of fire. The priest gathered the long hair of the girl in one hand, then thrusting the other beneath his robe, drew forth a knife. With a sudden jerk he threw back the head of the girl so as to leave bare her bosom, and raised the glittering blade. But at that instant a yell, wild and unearthly, rang through the lodge. The medicin lay grovelling on the ground, and Nahtourah was raised high up on the breast of Sharatack. He stood in the middle of the council-chamber, and glared upon the awed crowd. In his hand he held his tomahawk; his form swelled, and every feature was alive with passion. 'Nahtourah shall not die!' said he, in tones of smothered fury. 'Let the medicin beware! Nahtourah is the wife of Sharatack. The hawk has talons.' The priest rose from the ground, drew back from the neighbourhood of the warrior who had levelled him, forced his way through the crowd, and fled the lodge. A short silence followed the departure of the priest, who was rather feared than loved by the savages, and they were, therefore, more disposed to admire one who disregarded a power that overawed themselves. At length an old Indian rose. 'Nahtourah released the pale-faced prisoners. She merits death. 'Tis clear. But Sharatack has claimed her for his wife. 'Tis well! He is a great warrior. Her children will be warriors of the tribe. Are my words good?' A murmur of assent ran from mouth to mouth. Then, one after another the warriors rose, as if all business were concluded, and quitted the council-chamber, leaving Nahtourah and Sharatack. The young chief cut the bonds that bound the girl, and holding her before him at arm's length, gazed steadily in her face. 'The old warrior spoke well,' said he; 'Sharatack has taken an enemy to the Pawnees for his wife! will she love him?' With a glad cry the girl sprang forward, threw her arms round his neck, and pressed her cheek to his breast.

If Mr. Cooper will not give us any more Indian annals, we congratulate the public that the mantle has fallen on such worthy shoulders as those of Mr. Irving.

*Lyrics.* By John Lee Stevens. Pp. 144.

London, 1837. Bailey and Co.

This volume is what its name imports, a strain

of delicious music, running through many modes of harmony.

"As you may see  
Your own run over the ivory key."

There is a freshness as well as sweetness in Mr. Stevens's charming songs, that gives the idea of a bird singing out in the green branches to the summer sunshine. How graceful is the following:—

"When last we met, an idle band  
Of summer friends surrounded her,  
From which her worth could not command  
One single-hearted worshipping.  
To them she spake with accents bland,  
Yet passionless as sweet they were;  
To me she gave a stolen glance,  
Fraught with love's fervid utterance!  
Why should I wish me one of those  
Who secretly with envy burn—  
Whose brightest hopes no bliss disclose,  
Whose hearts no sacred fire inurn—  
Who listen where no feeling flows,  
On whom her looks in coldness turn?  
What thought about her path they move,  
Mine is her stolen glance of love!"

The next will find an answer in but too many.

"Oh! 'tis a bitter thing to be  
So near allied to poverty,  
That ev'ry working of the mind  
Must be to worldly gain confined  
Unceasingly!"

Oh! 'tis a painful thing to know  
Affection by its purest flow,  
And have some trouble in the soul,  
Searing and withering the whole  
Unaparingly!"

Oh! 'tis the keenest curse on earth  
To have a spirit formed for mirth,  
A heart designed for love, and yet  
To be by ev'ry ill beset  
Incessantly!"

Those who are cold are void of care,  
Congenial coldness they can bear;  
But those who feel as I feel now,  
To partial fortune cannot bow  
Quiescently!"

The Duke of Reichstadt is in another vein.

"There was darkness o'er the hearts  
Of the long devoted few,  
When Reichstadt raised his dying voice  
To breathe a last adieu!  
When the hope no longer beam'd  
Of a bright futurity,  
Wherein councils could might check no more  
A princely chivalry!  
And they thought upon the past—  
Of the radiant glory shed—  
When the eagle-plumed Napoleon  
A host of heroes led!"

'To my own loved native land—  
The land of my father's fame—  
I turn to France in my dying hour  
With blessings on her name!  
With the oft-repeated prayer  
For the noble—for the brave—  
For the home in which I hoped to win  
A sceptre or a grave!  
And though with her sacred soil  
I must never mingle more,  
Oh! give me—for my winding sheet—  
Her gallant tricolor!"

We conclude with two Claude Lorraine landscapes.

"Summer.

Now summer's breeze is on the wave,  
And landward breathes a healthful sigh;  
And youth to shady bowers fly,  
Or in the stream delighted lie.  
Their glowing limbs; the truant boy  
O'er hill and dale his swiftness tries,  
Chasing the wavering butterflies  
From flow'r to flow'r, with eager joy:  
The swallow spreads her glossy wings,  
And twitters, as with turn precise  
She seizes on some insect prize,  
And bears it to her nest, and clings.  
With claws extended, firmly there,  
Feeding her nestlings with parental care.

"Autumn.

Autumn, I raise the song to thee,  
And greet thy bounty on the plain,  
Where poppies mingle with the grain,  
Like rubies on a golden sea!  
The clust'ring grapes upon the vine,  
The downy peach, the nectarine,  
The blushing plum, the luscious pine,  
And all earth's richest fruits are thine.

Thy life is one long harvest day—  
Thy sickle the true sith of Time—  
And peasant boys, with uncouth rhyme  
And merry fays, sing their lay.  
As bearing the last sheaf they come  
To join the village shout of harvest-home !”

We are glad to see that a most respectable list of subscribers shows that Mr. Stevens's talents are appreciated. We now commend this very pretty volume (both outside and in) to the favour of the public.

*The Library of Useless Knowledge.* By Athanasius Gasker, Esq. F.R.S. &c. &c. Part I. *Auto-Biography of the Editor.* Small 4to., pp. 52. London, 1837. Pickering.

THE title and the name of the author seem to point the index of this joke to the *Library of Useful Knowledge*, and its editor, Dionysius Lardner. Whether the productions of the latter have made so strong an impression on the public mind, as to render parody and reference sufficiently distinct, it is out of our power to determine; but, as Athanasius Gasker goes on, we shall endeavour to understand him; and if we do, our readers shall have the benefit of our discoveries. For Part I., we must say that it is often too deep or obscure for our apprehension; and though we see the glimmerings of wit and humour, we confess they do not light us to the application we could wish. But our memory is so worn out, that we set up no standard in such matters; and, therefore, hits that do not strike us, may be perfectly palpable to others, who have not so many things to think of and distract their attention.

As it is, we shall endeavour to give a taste of this commencement—this *Auto-biography*. It sets out thus:—

“The Commissioners of the Poor Laws will understand me, when I say that I was born at Putney, in Surrey. I repeat the name of my birth-place, ‘PUTNEY,’ without any angry feeling towards, and in defiance of, the Registration Committee. ‘To write lives,’ says a favourite author,\* proceeding to instance one of those singular productions which appeared at the close of the sixteenth century, ‘is, to extract, from catalogues of unknown motive, the features which specious idea has imposed upon such a base.’ I deny this; and I proceed to illustrate, in the sequel, my opinion.”

“My father was a poor, but a respected man: my mother shared his sorrows and his dignity. I left my father's roof at an early age, in search of great truths in other lands. I did not find them; and I returned to my paternal dwelling. My father—he was dead; my mother—so was she: and I went abroad again. In thirty years of wandering; in visiting all the principal libraries of the world; residing in forty different monasteries in different countries; being member of most of the literary and philosophical societies in the world—all those of Europe; communicating with all the eminent men of my time, by letter and by conversation; with a mind ardent in proportion with the object of my research;—it may be conceived I became possessed of knowledge.

“At Potadam, as early as the year 1797, I was placed in a barrel of brown sugar, before the royal family of Prussia, that I might be rendered ridiculous, as being the author of my first principal literary production, ‘On the Nature of Sounds.’ My whispering apparatus, which I had caused to be erected, at great personal expense and trouble, in the drawing-room of the royal residence (and by which the queen was enabled to communicate

with any individual of her domestics, without another person in the room being aware of the circumstance), was destroyed, without my receiving back even the metal of which the separate conductors were composed, because the queen had been discovered, in a freak of temper at being differed with by his majesty, to have suddenly counter-ordered some smoked goose, in preparation for his majesty's supper. The only objection advanced by the court against my two folio volumes on sounds was, an absurd suspicion of the king's, that, in my chapter on ‘simple relations,’ I alluded purposely to a stupid nephew of his, who rendered himself obnoxious to the head gardener of San Souci, by eating a bag of real crocus bulbs, which he had left to dry on his trousers, in the sun. Being still under a species of arrest, even after the disgraceful insult which had been inflicted on me at Potadam, it was with considerable difficulty and inconvenience that I escaped from the clutches of my persecutors; owing my liberty to the kindness of my landlady, and being exposed to two hours of the night breeze of a northern climate, while I sat, with nothing to protect me but my shirt, across the roof of my lodging-house, to escape the scrutiny of the police. Arriving, however, at Rostock, I embarked for London; and, in a few days, ascended the Thames, with a favourable wind. It would be vain to attempt to describe the anxiety which I constantly felt, to circumvent a fatality which seems indigenous to English literature, namely, the necessity of the antecedent notoriety of an author, and of notoriety in the merest abstract, to bring attention to his productions, however valuable. England, once the land of chivalry, has now long since become the land of commerce alone. Chivalry is extinct; and the love of truth, which, indirectly, gave birth to chivalry, seems to have receded still further back on the surface of our moral history. The English face is on principles of economy; the English costume is on principles of economy; her temples, her religion, are on principles of economy. On my arrival in London, I paused to meditate on the nature and condition of truth, and the contingencies of honesty. I dwelt upon the treasure I felt, or fancied I possessed, and the means of communicating it to others. I saw the land of citizens and of merchandise in stirring activity and occupation; and I considered how I might beat arrest the passengers on the broad way of life, and induce them to listen to my words. Notoriety, I bethought me, must be my passport. And, with a natural inclination to unostentatious quiet, and an aversion to every thing partaking of the ingredients adapted to the excitement of popular clamour, my dilemma may be well conceived, as I seated myself in my chamber, to strike out some stratagem whereby my meed might be supplied. My name was unknown in England; and, although some degree of mystery had been attached to the name of Athanasius Gasker, among the learned societies of Europe and America, still it was absolutely necessary, in England, to affect something, which, like the striking of a gong, should startle the attention of a fraction of the population, however small, towards my obscure character. An expedient suggested itself: an attack upon the Lord Mayor of London.”

A number of extravagances are now described with minuteness, such as the attack on the lord mayor in his coach on Holborn Hill, and the *botheration* of a synod of archbishops, bishops, &c., assembled in a cellar of the Lon-

don Docks, to consider of the evil tendencies of the author's folio work, entitled *Tenebra*. We are then told:—

“In the year 1802, I published a small work, in duodecimo, 3 vols., entitled, ‘The Sexes of Facts, or the Economy of Discussion.’ It is interesting to look back on the effect that work produced. At Kensington, at this time, there was a very large boarding-school, or academy for young ladies, much patronised by a considerable portion of the nobility and gentry; but, especially, by a particular class of these, which, indeed, I should be far from willing to point at, in any way offensively, by designating them according to the nomenclature of any vulgar distinctions; but I am compelled, in order to the elucidation of my tale, to make use of an epithet (I am sure without wish of giving offence), which, in the imperfect parlance of society, is adopted in describing one great class of English people, in contradiction with the other: I mean the epithet—‘strict.’ The lady patronesses of Pedaster House Academy were then, to make myself intelligible, of the ‘stricter’ order of society. The mistress, as a matter of course, was strictness itself. The governesses, to use the phrase of one of the advertisements published formerly for the establishment, and which I have now in my possession, were—‘none but Genuine Women.’ The mansion stood—‘in a moral point of view.’ The domestics were—‘persons of Principle.’ And the gardens and pleasure ground were laid out—‘with a view to the One Great End!’ It was not long after I had made known, through the medium of the journals of the day, my intention of giving a course of public lectures, on ‘the Sexes of Facts, and Economy of Discussion,’ at the Crown and Anchor Tavern, that three of the lady patronesses of this distinguished academy honoured me with a visit, at my residence in Panton Square; requesting me to deliver a private course at Pedaster House. I acceded to their proposition; and, on the evening of the 6th of May, the anniversary of the Battle of Prague, accompanied by Lady Agnes Barnaby, Lady Letitia Program, and Mrs. Mirak, I drove down in my carriage to deliver my first lecture. How different are the feelings, I thought, as we rolled along, in the serene evening air, past the dull wall of the park:—(Lady Agnes, asleep; Mrs. Mirak, smiling at her own thoughts; and Lady Letitia, whisking the gnats with the tassels of her reticule). How different my situation, at present, from that, in which I was taken by an armed escort, to lecture upon the same subject, before the Emperor Paul, at St. Petersburg! Notwithstanding the persecutions which I had experienced, I could not, at this moment, resist indulging a grateful reflection, on the comparative freedom of knowledge in this country, when considered in reference to others in which I had resided. So flattered, indeed, did I feel, by the attention of my fair fellow-travellers, that, had it not been for their seniority, and the more becoming costume in which they exhibited themselves, I might have composed a complimentary ode, on the subject of that evening's excursion, entitled, ‘Mercury escorted by the Graces to the temple of Truth.’”

The lecture ends in a grand explosion, and the learned and ingenious author lets us into a number of his other wonderful inventions and discoveries; but, as we have allowed there is

\* “It is needless to comment upon that which we do not understand. But, although ‘de quibus ignora tace’ be a maxim of profound wisdom, ‘de quibus certus es loquere opportune’ is an injunction of, perhaps, equal value. I, therefore, annex this note to state my most unqualified ignorance of the meaning of these phrases.”

much as yet too recondite for us, and waiting the rest, we shall now conclude with Mr. Gasker's peroration:—

"I am alive! and, individually, I tell thee, thou 'Royal Navy!' I was witness to the tremendous eruption of Mount Tomboro, in the island of Sumbawa, in 1815, the explosions of which were heard at the distance of 900 miles; and, while out of a population of 12,000, only twenty-six individuals remained on the island to tell the tale; and while animals, and men, and trees, were whirled into the air,—that air being darkened by ashes to a distance of 300 miles from the spot,—I was seated, for three successive days, in my hat, out at sea, upon the floating cinders, contemplating that singular scene! I tell you, ye 'Soldiers!' I have contended with cranes on the banks of the Scamander, with no weapon of defence but an old cotton umbrella, and I have stood victorious there, among the air-ward bound! I tell you, ye 'Doctors!' (the most ignorant, if not the worst of men), ye who would fain despise all truth, while ye would lavish guineas for one of her secrets;—Mark me, gentlemen, while I tell ye (what ye will not believe—no matter, ye will anon), I am known in all the principal catacombs of Syria, Egypt, Italy, and Greece! and I have been vocally accompanied by every sad inmate there, as I played ancient national airs upon my galvanic bellows! Ye 'Priests!' ye amiable, but misguided men! I tell ye, I have waltzed with night-mares in the temples of Elora! Ay, and I have made grimaces at my own reflection in the Largo del Tofilo, until, affected by the miasma of that remarkable pool, I thought myself in earnest. Law! thou wast my father's calling; my father was an honest man! Time, however, is wasted in trifling intimations; and the development of my system, which the ensuing volumes of this library will contain, must speak for itself, and for the merits of my labours. Should that system fail to meet the approbation of this age, it is I who have miscalculated the moral manifestations of the times. Should it succeed, and should England once again be young, under the influence of its modest observances, human applause will not be needed, to eke out a fullness in the cup of ATHANASIUS GASKER."

*Case on the 43d Elizabeth for the Relief of the Poor. For the Opinion of Mr. Serjeant Snigge. Pp. 26. London, 1837. Longman and Co.*

THIS pamphlet caused some parliamentary and newspaper discussion, and it was questioned whether it was a genuine opinion of an ancient lawyer, or a modern production, good-humouredly imposed on the public, under that form. The internal evidence of the latter ought to have prevented any controversy; and there seems to be little doubt, that the harmless joke of style and fashion, was perpetrated by the late benevolent Sir Thomas Bernard. But it is of little consequence whose the sentiments are, if they are really wise and good; and certainly there is much both of sound sense and right feeling in these pages.

It is not for us to open up the broad and important subject of the New Poor Laws. Upon some of their leading points we have the strongest conviction,—1. That some great alteration in the existing system was absolutely necessary to prevent the country being destroyed by the locust masses of sturdy and undeserving paupers; 2. That the new system, though sound in principle, is in many parts objectionable and cruel in practice; 3. That so far from in-door relief being the *sine qua non*,

it ought to be eschewed wherever possible, and only resorted to in densely populated places. These, and some other opinions, we could defend against all comers; but this is not the time nor place, and so we shall just copy a piece or two of the pseudo Serjeant Snigge, as specimens, and with our hearty approbation.

"V. *Of rating the Poor.*—Qu. 5. Albeit we have many idle and dissolute poor, yet we have some very honest and industrious labourers, who do reside in cottages, and subsist and bring up their families entirely by their own industry. If, therefore, the cottages of these industrious labourers (which in fact are their houses) can be assessed to the support of those who are idle and dissolute, it will in some degree lighten the rate as to the householders; and at the worst can only bring some of the industrious poor upon the parish. Your opinion is therefore desired upon this point.

"This act enumerates 'lands, houses, tithes, mines, and saleable underwoods,' as the objects of the rate. If these industrious cottagers occupy any lands, houses, or other property, that comes within the words afore-rehearsed, I am inclined to think that they may, in point of law, be assessed for the same; notwithstanding they support their families chiefly by their daily labour, and therefore come under the general description of poor. But where a poor man doth sustain himself and his family merely by the sweat of his brow, and doth only occupy some hut, hovel, or cottage, as a place of refuge and shelter during his rest from labour, it would be a monstrous position that for that cottage,\* and for a few herbs growing round it, and without any species of property enumerated in the act, he should be assessed to the rate for the relief of the poor. Instead of encouraging diligence in cottagers, it would destroy all their industry. It would compel them all to become pensioners upon their parish; and convert an act, expressly declared to be 'for the relief of the poor,' into the instrument of odious and unprincipled oppression.

"VII. *As to the Churchwardens.*—Qu. 7. The parish conceives that the householders, proposed by them, and appointed by the magistrates, are to undertake the whole burden and trust of the office, the churchwardens being named in the act *pro forma tantum*; and that no meetings of the overseers, as such, are necessary, but that each should take one separate district of the parish, and therein collect and apply the rates as he thinks proper. What say you to this article?

"I have already said that the overseers are to meet together at stated times. It is their duty then to consult and agree how this act may be best executed, for the permanent improvement of the morals, industry, and welfare of the poor, so as to lessen the aggregate of vice and misery, to diminish the call for relief, and to supply the labourer, within the precincts of his own cottage, with the means of subsistence, the incitement to industry, and the principles of religion. To this duty the churchwardens are as strictly bound as any of the other over-

\* Those who wish to see how far cottages can legally be included under the description of houses, may consult Lord Coke's 2d Institute, p. 736. The distinctions are curious. It appears that any person converting a house into a cottage, except under special circumstances, was (by 31 Eliz.) subject to a penalty of ten pounds; that certain restrictions in another act (35 Eliz.) were applicable to cottagers and not to householders; and in another instance to some cottages in country places, but not to cottages in cities and boroughs, nor to any houses whatsoever. In short, by these two acts passed just before the 43d of Elizabeth, and by Lord Coke's second Institute, written a few years after it, cottages and houses appear to have been then considered as perfectly distinct and distinguishable from each other.

seers. They are equally responsible for the due performance of this weighty and honourable trust. And each of them, *pari passu*, is answerable for the execution of this office in every part of the parish, so far as he is not lett and impeded by sickness, or other just excuse, or controlled by the voice of the majority, which in this, as in other cases, must prevail.

"VIII. *As to apprenticing Children.*—Qu. 8. There hath been no provision made in the aforesaid parish for the employment and instruction of the children of the poor. This is alleged by some to be one reason why the parish is infested by about two hundred and thirty idle profligate children. The friends, however, of the parish hope to turn this circumstance to good account, as they have received a proposal from a settler of one of his majesty's newly discovered islands, to take them all as apprentices, under the aforesaid act, by one indenture; and not only to pay for the baskets in which they are to be shipped, but to allow the parish one noble for each child; a sum that is computed to be sufficient not only to pay the parish-rates of the year, but also to divide something among those who attend the vestry.

"The act of her late majesty hath directed competent sums of money to be raised for (*inter alia*) the placing out of children to be apprentices, thereby expressing, and not merely implying, that parish children are not to be sold or made away with, but that expense is to be incurred in apprenticing them, including, first, the expense of preparing and clothing them for an apprenticeship; and secondly, the fee or reward that shall be paid to a proper master for receiving them and instructing them in an honest and useful trade."

To conclude, hear the serjeant.

"I hold that there is a principle of morality which pervades every part of this act; a code of jurisprudential ethics, which makes it the interest of every other individual in a parish to be useful to the poor. The act declareth to the possessors of property, 'your interest shall from henceforth be united with your duty; and the exercise of judicious and useful charity shall operate to increase the value of your possessions.' It telleth them, that to educate the young, to encourage the industrious, to restore health to the sick, and to render all their parishioners capable of being useful to themselves and to the community: these are duties enjoined by divine authority; but we will make them the conditions annexed to the improvement and enjoyment of worldly property. 'If your cottagers' children are brought up in early habits of piety and industry, they will to you be a benefit, and not a burden; and they will be useful in their own parish, or acquire a settlement in another, at a tender age. If you encourage industry among your parishioners, you and your parish shall receive the benefit of it. If you are attentive to the health of the poor, your stock of labour shall be augmented, and the expense of medical attendance shall be diminished. If you give instruction and suitable occupation to the blind, the lame, the helpless, and the ignorant, you will enable them in part, if not entirely, to maintain themselves, instead of being supported at your cost. But if you neglect all these duties, if you break these conditions annexed to the improvement and enjoyment of your property, your rental shall be reduced, your burden increased, and those possessions, which promised you rest and enjoyment, shall be the source of vexation and disappointment, when you find that, through your own default, the greater part of your worldly estate must be applied by law, as a

parish-rate, to give a wretched existence to vice and idleness."

We repeat, whether written in 1604 or 1804, is little to the purpose. As Froth says, "Here be truths;" and truths are the same in all centuries.

*Lardner's Cabinet Cyclopædia: Domestic Economy. Vol. II.* By M. Donovan, Esq. M.R.I.A. Professor of Chemistry, &c. Pp. 388. London, 1837. Longman and Co.; Taylor.

MR. DONOVAN'S reputation as a chemist renders any volume from his pen, on human food, a matter of general interest; and, though publications of this class must consist much of compilation (and, indeed, a dozen volumes might be made from very superior French works on the subject), we are glad to see them pointed, and rendered more practically useful by men of skill and talent. In his previous tome, having treated of fluid aliments, the writer here comes to solids, and says, "The natural distribution of food into solids and liquids, has suggested a corresponding division of this treatise into two parts; and, as it was judged that they would occupy nearly equal spaces, a volume has been allotted to each. It seemed to be a matter of little moment which of these subjects took precedence." The drink before the meat was, to be sure, a little out of the usual routine; but the present description of "the different kinds of solid food, both animal and vegetable, that are used by the various nations of the globe, as well as the processes to which they are subjected, with a view of rendering them more wholesome or agreeable—some of which, it is to be lamented, are of a nature that ought to be discontinued"—is, nevertheless, a very good horse, though put after the cart!

The author sets out with a list of all animals which are consumed as food, and gives us a sort of natural history, including lions, tigers,\* &c. as parts of these beasts are eaten by savages in various parts of the world. No wonder that cannibalism is included; and a curious dish it is.

"During the famine which prevailed amongst the crew of an English ship, burnt on sea, in 1727, they were compelled to support nature by eating parts of their dead companions, and drinking their blood, each dead body furnishing about a pint. The only part which they could relish was the heart. It is stated by Stedman, on the authority of an officer who had the curiosity to taste human flesh, cooked by some Gango negroes, that 'it was not inferior to some kinds of beef or pork.' The opinion of the ancients was, that the taste of human flesh most resembled that of pork. (*Galen*). From all these statements, it appears that human flesh is not very different from some other kinds; that to those who have got over the moral disgust of such food, it is not only not inferior, but has commendatory qualities that render it a kind of delicacy. \* \* \* Mr.

Anderson says, that one or two Battas mentioned to him 'their having partaken of human flesh repeatedly, and expressed their anxiety to enjoy a similar feast upon some of the enemy. This, they said, was their principal inducement for engaging in the service of the sultan. Another boasted of having drunk the blood as it flowed from the veins of his wife's seducer, whose head he cut off. Stedman relates that a ship's crew and their captain, being cap-

tured by the negroes of Great Drawin, about 30 miles north of the river St. Andrews, they were all cut to pieces, and salted, in order that no part of such valuable food should be lost. Cannibalism, although always calculated to excite horror, is divested of atrocity when it is resorted to in the last agonies of starvation, unless accompanied by murder. When the principle of self-preservation comes into full operation, all social relations seem to be dissolved, and there is no act which men will not commit in order to preserve existence. In almost all the instances on record, where a number of persons have been reduced to the last extremity of hunger, they, however, not only relieved the cravings of nature by feeding on their miserable companions, who had already fallen victims to the horrors of their situations, but, in order to obtain a new supply, have dispensed with adherence to the laws of God and man by committing murder, and at a time when another dawn would probably call them before their Maker, to answer for an offence badly disguised by the fairness of the process by which the fatal lot was drawn. It is not the province of man to pronounce judgment on the ethics of his fellow-creature, in the last extremities of starvation, when the feelings are rendered obtuse, and the intellect feeble, by a situation which, perhaps, none can appreciate but those who have felt its influence. The history of shipwrecks, sieges, and famine, affords ample testimony that the repugnance of civilised man to human flesh is generally overcome by the cravings of nature. An exhibition of this fact, on a lamentable scale of magnitude, is to be found in the fatal expedition of the French into Russia, under Napoleon. \* \* \*

"During the siege of Paris by Henry IV. 30,000 persons died of famine in one month. The miserable citizens attempted to make a kind of nourishment from the bones of the dead, which, being bruised and boiled, afforded a sort of jelly. But this unnatural diet occasioned even a more speedy death. It is related and attested by the most authentic testimony, that one woman actually murdered and devoured her own child. The same tragedy was enacted at the siege of Jerusalem; such was the famine, that human flesh was commonly eaten, and mothers ate their children. In the year 945, during a famine at Bagdad, even punishment could not restrain persons from devouring children. During the famine of Samaria, B.C. 893, mothers ate their children. An appalling account of feeding on human flesh is given by the poet Spenser, in his description of one of the famines of Ireland. We have heard of the feasting of jackals and hyænas on the putrid remains of corpses which they scratch out of their graves; but this was actually done by the miserable Irish, urged by irresistible necessity. The following is his pathetic statement. Speaking of the people of Munster, he says, 'They were brought to such wretchedness, as that any stony heart would have rued the same. Out of every corner of the woods and glynnes, they came creeping forth upon their hands, for their legs could not bear them; they looked like anatomies of death; they spake like ghosts crying out of their graves; they did eate the dead carrions—happy were they who could finde them; yea, and one another some after, inso-much as the very carcasses they spared not to scrape out of their graves; and if they found a plot of water-cresses or shamrocks, there they flocked as to a feast for the time.' But, perhaps, the most extraordinary instance on record of cannibalism, arising from starvation, is that

of the Indian captives, related by Petrus de Osma (1558), who, for want of other food, actually cut off the calves of their own legs, and having broiled them, devoured them. Cannibalism, from a vindictive motive, once so general amongst savage nations, still exists, notwithstanding the progress of Christianity. Perhaps, nowhere was it practised with more cold-blooded, and, as may be said, curious barbarity, than amongst the Brazilian savages in time of war. After a sanguinary fight, conducted with amazing animosity and fury, the prisoners were carried away, and subjected to extraordinary treatment, apparently kind, but instigated by a diabolical motive. When the prisoner arrived at the village, his captors made him cry out 'Here I am, come to be your meat.' Out came the whole population. He was delivered over to the women, who beat him with their fists, pulled his beard, naming at each blow some slain friend, and then half strangled him with cords. A woman then approached, and with a bit of broken glass scraped off his eyebrows, and, if she could, his beard. They then compelled him to dance to their singing. They next made preparations for the feast; but while these were going on, the prisoner was fed with the most delicate viands: nay, the captor gave his sister or his daughter to him for a wife. Should there be any progeny resulting from this marriage, it was considered entirely with reference to the father, and sooner or later it was murdered and devoured. \* \* \* Some of the chief atrocities of the Brazilians have been noticed by other travellers in South America. Pedro de Cieca declares that it was a practice to eat the children born to them by their female captives, and also to give wives to the male captives, in order that the progeny might be fattened and eaten. He further affirms that human flesh was exposed in the shambles for sale. The following account is from the 'North American Review,' April 1827, p. 372:—'There is a horrible institution among some Indian tribes, which furnishes a powerful illustration of their never-tiring love of vengeance. It is called the man-eating society, and it is the duty of its associates to devour such prisoners as are preserved and delivered to them for that purpose. The members of this society belong to a particular family, and the dreadful inheritance descends to all their children, male and female. Its duties cannot be dispensed with, and the sanctions of religion are added to the obligations of immemorial usage. The feast is considered a solemn ceremony, at which the whole tribe is collected as actors or spectators. The miserable victim is fastened to a stake and burned at a slow fire, with all the refinements of cruelty which savage ingenuity can invent. There is a traditionary ritual which regulates, with revolting precision, the whole course of procedure at these ceremonies. The institution has latterly declined; but we know those who have seen and related to us the incidents which occurred on these occasions, when white men were sacrificed and consumed.'

But we leave these not very appetising details for a brief passage on cruelty to animals, in killing them for human use:—

"Throughout London, at certain seasons, are to be seen the impaled bodies of thousands of larks—those pretty warblers, whose aerial frolics divert as much as the sweetness of their song delights. Is the miserable half-ounce of flesh on the body of this pride of songsters of greater relish than its contributions to the more refined pleasures of man, to the imagery of the poet, or to the embellishment of the rural

\* Mr. D. is not just to this beautiful and ferocious animal. He says, 'he slaughters every creature in his way that he can master, and there are few that he cannot easily overcome; yet he is a coward, and prefers an ambush to an open attack.' Now, he is not a coward for following his natural habits.—Ed. L. G.

some? Elsewhere appetite is invited by the spectacle of cages closely crowded with live quails, where there is just room for their enlarged and glutted bodies; and where, in fruitless efforts to extricate themselves from their prison, they await the hour that consigns them to the stew-pan. But the glutton will defend himself by the flimsy argument, that it is necessary to thin the species. Amidst the myriads of the smaller birds, his destroying efforts are of little avail; and the fact may as well stand confessed, that a depraved appetite is the incentive. It is so common in some streets of London, as to excite little emotion, to see hundreds of live eels exposed for sale, in boxes stratified with sand, giving appalling evidence of vitality by their writhings; and still more exquisitely, when the skin is torn from the quivering flesh, and the struggling creature is slowly relieved from its tortures by being broiled on the gridiron. There is no excuse for such practices; for, although the tenacity of life evinced by the eel has been pleaded, the real and concealed object is flavour: there is nothing easier than to kill this fish; it is done in a moment, by piercing the spinal marrow with a sharp bodkin, close to the back part of the skull."

Upon the first paragraph we would call attention to the singular fact, that it seems to be no matter, and makes no perceptible difference, whether birds are pursued, and hunted, and destroyed in thousands, or left altogether undisturbed. Robins are not killed, but there is always about the same average number of robins: larks, on the contrary, are killed in myriads, but there is, also, always about the same supply of larks. What is it that keeps the balance in either case so even?

One of the most valuable chapters in the volume, however, is the fifth, on the "loss of weight which animal food sustains in roasting and boiling." The whole information on this subject is worthy of the attention of housekeepers, &c., for whose use we select some samples.

"It has been already shewn, that in whatever manner meat is cooked, there is a considerable diminution of substance, the loss consisting chiefly of water, juices, soluble matter, and fat. In an economical point of view, a comparison of the loss incurred in the two most usually employed processes, roasting and boiling, is interesting, yet has not occupied the attention of the public as much as the importance of the subject seems to demand. Professor Wallace, of Edinburgh, has given us the results of some experiments made to determine the loss which meat undergoes in cooking. It is to be regretted that it is not more in detail, and that the weight of the bone in each joint was not ascertained; but still it is of great value. The results, reduced to 100 pounds of meat, are as follow:—

100 pounds of beef lost in boiling	25½
100 pounds of beef lost in roasting	32
100 pounds of beef lost in baking	30
100 pounds of legs of mutton, averaging about 9½ pounds each, lost in boiling	21½
100 pounds of shoulders of mutton, averaging 10 pounds each, lost in roasting	31½
100 pounds of loins of mutton, averaging 8 pounds 12 ounces each, lost in roasting	35½
100 pounds of necks of mutton, averaging 10 pounds each, lost in roasting	32½

Thus, the loss in boiling beef or mutton was less than in roasting. And it appears that meat loses by the cooking about one-fifth to one-third. A few years since, I undertook the superintendence of some experiments of the same tendency, with the view of inserting the results in this volume. These trials were made

on several parts of the different animals, with as much attention to accuracy as the nature of the subject permitted. They were made on different qualities of the same kind of meat, at various seasons, both in England and Ireland. Such experiments are exceedingly troublesome, and occasion no small inconvenience; it is, therefore, the less surprising that the subject has been so little investigated; and the following results, in the absence of any others so particularly detailed, will, perhaps, prove interesting. Allowance must be made for the nature of such processes, as the difficulty of fixing an average price of meat, fish, and poultry, owing to variations occasioned by the supply and the season, the want of uniformity in the prices of the city, and by the exorbitant demands of some vendors of these articles. The degree of fatness was in all cases brought to a standard by cutting off all excess, and leaving the meat in a proper state for housekeepers' use. The meat was in all cases cooked as nearly as possible to the same degree, and the weights were determined with exactness: avoidripous weight throughout is intended. The bones were entirely stripped of their meat previously to their being weighed. The only cost taken into account is that of the meat, leaving out fuel, &c.

"Experiment 1.—A piece of beef, roasted. It consisted of four of the longest ribs, and was not remarkably fat; its weight was 11½ lbs. During the process of roasting it lost 2 lbs. 6 oz., of which 10 oz. were fat, and 28 oz. were water dissipated by evaporation. When the meat was dissected off with the utmost care, the bones weighed 16 oz. Hence, the weight of meat, properly roasted and fit for the table, was but 7 lbs. 11 oz., out of 11½ lbs. originally submitted to experiment. This beef would cost in London 8½d. per lb. The roasted beef cost, therefore, 12½d. per lb. In another trial, a piece of beef of the same description, the tops of the ribs having been rejected with their meat, was submitted to the same mode of trial; the weight of bone in 10½ lbs. was 16 oz., and the fat 11 oz., which agrees with the former estimate."

Other parts are submitted to similar tests, and we learn, of mutton:—

"Experiment 17.—A leg of mutton, weighing 9½ lbs. when boiled gave 1 lb. of bone, shank included; it lost in the boiling 1 lb. 2 oz.: the meat weighed 7 lbs. 2 oz. If the butcher's price was 8d. per lb. the meat cost about 10½d. per lb.

"Experiment 18.—A similar leg, weighing 9 lbs. 6 oz. afforded 15 oz. of bone, and lost 12 oz. in the boiling: the meat weighed 7 lbs. 11 oz. At 8d. per lb. butcher's price, the boiled meat would cost 9½d. per lb.

"Experiment 19.—A leg of small Scotch mutton, weighing 6 lbs., afforded 10½ oz. of bone, lost 5½ oz. in the boiling, and the meat weighed 5 lbs.: cost 9½d. per lb. if butcher's price be 8d."

The following are miscellaneous:—

"Experiment 28.—A fore-quarter of lamb, weighing 9 lbs., afforded, when roasted, 20 oz. of bone, and lost 1½ lb. in the roasting: the meat weighed 6 lbs. If the butcher's price be 8½d. per lb. the roasted lamb costs 12½d. per lb.

"Experiment 31.—A hand of salt pork, weighing 4 lbs. 5 oz., lost in boiling 11 oz. The bone weighed 9 oz.: the meat was 8 lbs. 1 oz. If the first cost of the pork was 7½d. per lb. the meat, when duly boiled, cost 10½d. per lb.

"Experiment 34.—A knuckle of veal, weighing 6 lbs., when duly boiled, lost half a pound. Its bones, perfectly cleared of meat, weighed

2 lbs. 6 oz.; the meat weighed 3 lbs. 2 oz. Hence, if the butcher's price was 5½d., the boiled meat cost 10½d. per lb.

"Experiment 35.—A goose, properly trussed, weighed 4½ lbs.: in this state it was roasted, and, when sufficiently done, was found to have lost 18 oz. The skeleton weighed 12 oz.; the meat weighed 3 lbs. This goose would cost, in London, 4s. 6d. Hence, the roasted meat amounted to 1s. 8½d. per lb.

"Experiment 41.—A turkey, with its liver and gizzard, weighing 4 lbs. 14 oz., was boiled; it lost 12 oz. The skeleton weighed 13½ oz.; the meat 3 lb. 4½ oz. If this turkey cost 3s. 6d., the boiled meat amounted to 1s. 1d. per lb.

"Experiment 43.—A young duck, weighing 20 oz., lost 5½ oz. in roasting. Its bones weighed 2½ oz.: the meat was 12½ oz. It cost 2s. 6d.: hence, the flesh amounted to 3s. 3½d. per lb.

"Experiment 46.—A fowl, with its liver and gizzard, weighing 1½ lb., was roasted. It lost 3 oz.: the skeleton weighed 4½ oz., and the flesh, 16½ oz. If such a fowl cost 2s. 6d., its meat, when roasted, would cost 2s. 4½d. per lb.

"Experiment 47.—A chicken, weighing 1 lb. 4½ oz., when roasted, lost 3½ oz. The bones weighed 3 oz.; the flesh, 13½ oz. If the chicken cost 2s. 4d., the meat, roasted, was worth 2s. 8d. per lb.

"Experiment 56.—A fine mackerel, which, when trimmed, and ready for boiling, weighed 23½ oz. (including the weight of the roe, 2½ oz.) It cost 10d. It lost 1½ oz. in the boiling. The skeleton, carefully collected, along with the gills, fins, and tail, weighed 4½ oz. Hence, the cost of the eatable parts of the boiled fish was 9½d. per lb.

"It will now be necessary to collect the results of all these experiments into a kind of conspectus, for the sake of more easy comparison: and it is to be understood, that, in the following estimates, when the butcher's price is mentioned, it of course comprises meat and bone in the usual manner. But, when the ultimate cost of the cooked meat is specified, it refers to the price cost of the meat only, the bone being considered valueless: and it is supposed that the fatness of the meat was such as good meat is expected to have, without any redundancy being left on it. From an average of the first five experiments, it appears that, when the butcher's price of ribs of beef is 8½d. per lb., the cost of the meat, when duly roasted and fit for the table, is 11½d. per lb., and that the average loss of weight arising from the liquefaction of the fat, and the evaporation of water from the juices, is 18 per cent. From an average of the next six experiments, it appears that, when the butcher's price of sirloins of beef is 8½d. per lb., the cost of the meat, when duly roasted and fit for the table, is 1s. 1½d. per lb., and that the average weight lost during the roasting is 20½ per cent. From an average of experiments 11, 12, and 13, it appears that, when the butcher's price of salted briskets of beef is 6d. per lb., the cost of the meat, when duly boiled and fit for the table, is 8½d. per lb., and the loss incurred in boiling, arising from the extraction of fat and juices, is 18 per cent. From an average of experiments 14 and 15, it appears that, when the butcher's price of salted flanks of beef is 6d. per lb., the cost of the meat, when duly boiled, is 7½d. per lb., and the loss in boiling is 13½ per cent. From experiment 16, it appears that, when the butcher's price of salted tail-ends of beef is 7d. per lb., the cost of the meat, duly boiled, is 8½d. per lb., and the loss in boiling is 13½ per cent. From an average of experiments 17, 18, 19, 20,

and 21, it appears that, when the butcher's price of legs of mutton is 8d. per lb., the cost of the meat, when duly boiled and fit for the table, is 10d. per lb., and that the average weight lost during the boiling is 10 per cent. From an average of experiments 23 and 24, it appears that, when the butcher's price of legs of mutton is 8d. per lb., the cost of the meat, when duly roasted, is 1s. per lb., and the loss incurred by roasting is 21½ per cent. No account is here taken of experiment 22, because the meat, being over-roasted, amounted to 1s. 2d. per lb., and this result would have rendered the average above what it ought to be. The loss incurred by roasting was 27½ per cent. From an average of experiments 25, 26, and 27, it appears that, when the butcher's price of shoulders of mutton is 7d. per lb., the cost of the meat, duly roasted, is 11d. per lb., and the loss incurred by roasting is 28 per cent. From an average of experiments 28 and 29, it appears that, when the butcher's price of the fore-quarter of lamb is 8½d. per lb., the cost of the meat, duly roasted, is 1s. 1½d. per lb., and the loss by roasting is 22½ per cent. From experiment 30, it appears that, if the first cost of hams be 10d. per lb., the meat, duly boiled, skinned, and browned, will amount to 1s. 1½d. per lb., and the loss by boiling is 12½ per cent. From experiments 31 and 32, it appears that, when the hand and leg of salt-pork average 8d. per lb., the boiled meat amounts to 10½d. per lb., and the loss in boiling is 13½ per cent. From experiment 33, it appears that, if the first cost of bacon is 8d. per lb., the meat, when duly boiled, skinned, and browned, amounts to 10½d. per lb., the loss in boiling alone being 6½ per cent. From experiment 34, it appears that, when the butcher's price of knuckle of veal is 5½d. per lb., the meat, duly boiled, costs 10½d. per lb., the loss in boiling being 8½ per cent. From an average of experiments 35, 36, 37, it appears that, at the prices of geese quoted, which average 12½d. per lb. for the raw flesh, the cost of the roasted flesh is 1s. 7d. per lb., and the loss, per cent, 19½. From an average of experiments 38, 39, and 40, it appears that, at the prices of turkeys quoted, which average 10d. per lb., the cost of the roasted flesh is 1s. 2½d. per lb., and the loss, per cent, is 20½. From an average of experiments 41 and 42, it appears that, when turkeys are sold at the last-mentioned price, the cost of the boiled flesh is 1s. 1½d. per lb., and the loss, per cent, is 16. It appears, also, that the roasted flesh of turkeys sometimes amounts to 4s. 2d. per lb. From experiments 43, 44, and 45, it appears that, at the prices of ducks quoted, which average 1s. 1½d. per lb. in the raw state, the cost of the roasted flesh is 2s. 8d. per lb., and the loss, per cent, is 27½. From experiments 46, 47, and 48, it appears that, at the prices of chickens quoted, which average 1s. 6½d. per lb. in the raw state, the roasted flesh amounts to 2s. 7d. per lb., and the loss, per cent, is 14½. From an average of experiments 49, 50, 51, 52, 53, and 54, it appears that, at the prices of chickens last quoted, the average cost of the boiled flesh is 2s. 8d. per lb., and the average loss is 13½ per cent. From experiment 55, it appears that, when turbot in the raw state is sold at 9½d. per lb., the boiled fish costs 11½d. per lb.; the loss in boiling is 5½ per cent. From experiment 56, it appears that, when mackerel sells in the raw state at 6½d. per lb., the boiled fish costs 9½d. per lb., the loss in boiling being 7½ per cent. From experiment 57, it appears that the roasted flesh of a woodcock sometimes costs 16s. per lb., and sometimes 2s. But the flesh of the quail is still more expensive. This bird, when fattened,

is sold at the enormous price of 3s.; and, when allowance is made for the loss in cooking and the bones, the meat may be estimated at 2 oz., which brings the cost of the cooked flesh to 1½d. per lb.! Those to whom such morsels are necessary are not to be envied. A haunch of venison, weighing 26 lbs., will cost 3½ guineas. The meat of this, when roasted and detached from the bone, will amount to about 3s. 10d. per lb.; and, if the animal was more than usually fat, to 4s. The following statement gives the results in a still more abstract form; but the prices apply to London only. The articles are arranged in the order of their costliness in the London market:—

Names of the Articles of Food estimated.	Cost per pound, raw.	Cost per pound, cooked.	Loss per cent in cooking.
Salted flank of beef, boiled .....	4.	4.	13½
Salted tail-end of beef, boiled .....	6	7½	13½
Salted brisket of beef, boiled .....	6	8½	18
Mackerel, boiled .....	6½	9½	7½
Legs of mutton, boiled .....	8	10	10
Bacon, best part, boiled .....	8	10½	6½
Hand and leg of salt-pork, boiled .....	8	10½	13½
Knuckle of veal, boiled .....	5½	10½	8½
Shoulders of mutton, roasted .....	7	11	28
Ribs of beef, roasted .....	8½	11½	18
Turbot, boiled .....	9½	11½	5½
Legs of mutton, roasted .....	8	12	21½
Turkeys, boiled .....	10	13½	16
Sirloin of beef, roasted .....	8½	13½	20½
Fore-quarter of lamb, roasted .....	8½	13½	22½
Hams, boiled .....	10½	13½	12½
Legs of mutton, over-roasted .....	8	14	27½
Turkeys, roasted .....	10	14½	20½
Hamburg hung-beef, ribs .....	12	18	9½
Geese, roasted .....	12½	19	19½
Woodcocks, roasted, cheap season .....	—	24	—
Chickens, roasted .....	18½	31	14½
Chickens, boiled .....	18½	32	13½
Ducks, roasted .....	13½	32	27½
Haunch of venison, roasted .....	—	46	—
Turkeys, large, crammed .....	—	50	—
Woodcocks, scarce season .....	—	192	—
Quails, fattened .....	—	288	—

It appears from the experiments, that

The loss per cent on roasting beef, viz. sirloins and ribs together, is .....	19½
The loss per cent on roasting mutton, viz. legs and shoulders together, is .....	24½
The loss per cent on roasting lamb, viz. the fore-quarter, is .....	22½
The loss per cent on roasting geese is .....	19½
The loss per cent on roasting turkeys is .....	20½
The loss per cent on roasting ducks is .....	27½
The loss per cent on roasting chickens is .....	14½

Thus, the loss on roasting varies from 14½ to nearly double that rate. The average loss on roasting butchers' meat is 22 per cent, and on roasting domestic poultry is 20½.

The loss per cent on boiling mutton, viz. legs, is .....	10
The loss per cent on boiling hams is .....	12½
The loss per cent on boiling salt-beef is .....	18
The loss per cent on boiling salt-pork is .....	13½
The loss per cent on boiling bacon is .....	6½
The loss per cent on boiling knuckles of veal is .....	8½
The loss per cent on boiling turkeys is .....	16
The loss per cent on boiling chickens is .....	13½

Thus, the loss on boiling varies from 6½ to 16. The average loss on boiling butchers' meat, pork, hams, and bacon, is 12, and on boiling domestic poultry is 14½. These estimates of butchers' meat do not agree with those of Professor Wallace. I shall select for contrast all those cases that can be compared.

100 pounds of beef lost in boiling .....	Wallace. My trial.
100 pounds of beef lost in roasting .....	26½ 15
100 pounds of legs of mutton lost in boiling .....	32 19½
100 pounds of shoulders of mutton lost in roasting .....	21½ 10
100 pounds of shoulders of mutton lost in roasting .....	31½ 28

The average loss in boiling and roasting together is, according to Professor Wallace, 28 per cent; according to my trials, it is but 18. I know not how to reconcile these results otherwise than by supposing a difference in the meat, or its fatness, or in the duration of the

heat. I used meat of sufficient, but not unprofitable fatness, such as is preferred in families; the meat was in all cases a little rare at its centre, and the results were determined with the utmost care. In great public institutions, where economy is studied and every thing is regulated by weight and measure, tables of this kind do not afford a guide that is to be implicitly relied on. It is obvious that another element must be taken into the calculation to ensure true results,—the ratio in which each article of food satisfies the appetite, which varies with almost every individual."

On vegetables, the experiments are equally curious:—

"We may safely assume that one quarter only of the weight of potatoes is solid vegetable nutriment. According to Vauquelin and Percy, 1 lb. of good bread is equal, in nutritive power, to 2½ lbs. of potatoes; and 75 lbs. of bread and 30 of meat, are equal to 300 lbs. of potatoes. Cabbage has been examined by Schrader, and found to contain, in every hundred parts, by weight, but 6½ of solid matter: that is, 1 lb. contains less than 1 oz. of matter that can contribute nourishment. This agrees pretty nearly with the estimate of Sir H. Davy. Greens, according to Vauquelin, contain 8 per cent of solid matter capable of nourishing, or 1½ oz. in the pound. Turnips, according to Sir H. Davy, contain but 4½ per cent of solid nutritive matter; that is, 1 lb. contains less than three-quarters of an ounce. Vauquelin, however, represents the quantity at 8 per cent; and he found that 3 lbs. of turnips and 4 lbs. of cabbage are equal, in nutritive effect, only to 1 lb. of potato. Carrots, according to Sir H. Davy, contain 9½ per cent of solid matter capable of nourishing; but Vauquelin's estimate is 14. Adopting a mean, therefore, we find that 1 lb. of carrots supplies nearly 2 oz. of solid nutriment. Green peas may be inferred, from the analysis of Einhoff, to contain about 70 per cent of solid matter; but how much of this is nutritive it is hard to determine. Vauquelin says, they contain 93 per cent. Sir H. Davy estimates the solid matter of dried peas at but 57 per cent; and if this be correct, it is not possible that green peas can contain any thing like the quantity stated by Vauquelin, or even Einhoff. It is evident, however, that peas are rich in nutriment, and possess this peculiar quality, that about one-fifth of the solid matter estimated in the analysis of Einhoff, partakes somewhat of the nature of animal matter. Beans also contain his partly animal, partly vegetable, substance. The solid nutritious matter contained in beans, according to Davy, is 57 per cent, the same as in peas. The beans examined by Einhoff, contained about 75 per cent of matter which might be supposed capable of nourishing. According to Vauquelin, French beans contain 92 per cent of nutriment; and, modifying Einhoff's analysis of kidney beans, it would appear that they contain much about the same proportion. The other vegetables used at table have not been examined by chemists as to the quantity of solid matter in them; but the examples adduced, which, of course, can only be admitted as approximations to an estimate of nutritive power, prove that the vegetable esculents most commonly made use of, contain but a small ratio of real vegetable matter; and even the whole of that may not possess the power of nourishing. This is a most important consideration to be taken into account. Butchers' meat, taking one kind with another, averages 35 per cent of real nutritive matter; at least, such was the esti-

mate presented by MM. Vanquelin and Percy to the French minister of the interior. Adopting this determination, we are prepared to appreciate the quantity of real nutritive matter received into the stomach, when a meal of plain meat and vegetables has been eaten: it is not practicable to come to any conclusion when made dishes are used. It is a subject of interest, and particularly so to the inhabitants of the British isles, who are said by foreigners to make use of more animal food than is necessary or wholesome. In order to set the inquiry in an intelligible point of view, some homely subjects must be brought before the reader, and some calculations on matters that are not generally made questions of arithmetic; the results will, perhaps, be such as he had not anticipated, and will probably repay him for the scrutiny that is made into the secrets of his dinner-table. In the following estimates, it is supposed that the animal food made use of is mutton, and that no other is ever resorted to: a supposition adopted to avoid confusion, and easily modified into the assumption of any other meat, by reference to the preceding chapter. Some persons may smile at the apparently whimsical turn which a subject of this kind must assume; but should they chance to recollect, amidst their pleasantries, that, perhaps, curtailment of life is concerned, they may find something in these speculations of a graver character.

"In order, then, to equalise the animal and vegetable matter, and to increase the total quantity, the ratio should be  $8\frac{1}{2}$  oz. of boiled mutton, 10 oz. of potato, and the same of turnip; the total amount of food swallowed will be  $28\frac{1}{2}$  oz., but the quantity of real nutriment will be but 6 oz., half being animal, and half vegetable matter. This is, certainly, a sufficient meal for most persons who have but little laborious occupation; for, if a pint of liquid be drank at the same time, the load on the stomach will weigh 3 lbs.; and this will be increased to  $4\frac{1}{2}$  lbs. if a pint of wine be swallowed. Now, the difference between  $8\frac{1}{2}$  oz. of boiled meat and 10 oz. appears very trivial; but, if the greater of the two quantities be persevered in regularly every day for the term of a man's adult life of half a century, it may excite a little surprise in the person who practices it, to learn that he will have consumed a flock of sheep, consisting of about fifty-three head, in excess above what he ought to have made use of. In a life of sixty-five years, allowing  $8\frac{1}{2}$  oz. per day for fifty years, two-thirds of that quantity for ten years, and 3 oz. a day for three years of childhood, the total animal food amounts to 350 sheep. If to this be added the excess above mentioned, the number of sheep, the cooked meat of which is devoured by one man during a life of sixty-five years, is about 400; along with five tons of potatoes, about the same of turnips or other vegetable, nine tons weight of common drink, and six tons weight of wine, at one pint per day for thirty years only; thus, for dinner alone, above thirty tons weight of solids and liquids must have passed through the stomach. Inordinate work will wear out any machinery before its time, especially if the work performed be of a peculiarly wearing character. Whether it is advisable to add the fifty-three unnecessary sheep to one's dinner, is a question which every reader will answer to himself as he thinks proper. The food of old Parr, who died at 153 years of age, consisted of cheese, coarse bread, milk, and small beer. Would it have made no difference in the duration of his life if he had swallowed 1050 sheep, for about this

number would have been his share at the usual rate, along with his twenty tons of wine? It may assist in drawing a conclusion, to recollect that when he was brought to London and lived in splendour, 'fed high, and drank plentifully of the best wines,' he soon died; and his death was generally attributed to that cause, for he had vigour of body 'to have lived a good while longer,' as the reporter says."

We conclude with one remark, only observing that the author's recipe for making coffee is the best extant:—

"An article of food which is safe and nutritious in one country, may be even poisonous in another; for there are national as well as individual idiosyncrasies; or the nature of such an article of food may vary with the climate, and of this instances are common. To live according to the dogmas of dietic writers is not a little troublesome; and, in the course of some medical experience and intercourse with valetudinarians, I have witnessed very bad effects from the study of books, filled with fastidious criticisms on food, and fanciful distinctions of qualities, which, in truth, apply but to a small portion of mankind, yet are calculated to excite doubts and apprehensions amongst the weak-minded and hypochondriacal to an injurious extent. Indeed, it seems a question which would admit of controversy, whether too little or too much care in diet is more injurious. After all, perhaps, Pliny was the best adviser when he said, that in the selection of particular kinds of food we should not be too precise; that we should accustom ourselves indifferently to all kinds of diet, and nourish the body from a variety of sources."

*The Historical Antiquities of the Greeks with reference to their Political Institutions.* By William Wachsmuth, Professor of History in the University of Leipzig. Translated from the German, by Edward Woolrych, Esq. 2 vols. Oxford, 1837. Talboys.

THIS is a translation of a work which, for some time, has obtained a deserved celebrity in the literary world. It has been observed by one of the greatest of our modern scholars, Dr. Arnold, that "with all the characteristic learning and ingenuity of his countrymen, Wachsmuth unites a sounder judgment, and a more chaste and reasonable scepticism than their works often exhibit." From the peculiarities of his style, and the complicated nature of the subject of his disquisitions, he is an author whose meaning is, occasionally, extremely difficult of comprehension even to those who are no small proficient in the German language; and, if we may believe Mr. Woolrych, it is now and then not easily intelligible to his countrymen themselves. Any attempt, therefore, to place a work of this importance in a position which may be accessible to the general reader, is worthy of encouragement, especially when conducted, as in the present instance, by a gentleman who is perfectly master of the views and intentions of the original. The obscurity which is frequently found in the text is not always removed in the translation, but there are few difficulties yet remaining, and those of comparative insignificance. The second part of the work, which is unpublished, will also consist of two volumes. The general index, which is promised with their appearance, is much wanted in the present publication, and will be of the utmost service in directing the attention to the valuable and miscellaneous information which is spread over these archaeological pages. When the remainder of the translation is completed,

we may, perhaps, devote a column to a slight sketch and examination of the nature and contents of this monument of the industry and talents of our German fellow-labourers. In the mean time we advise our readers to avail themselves of the advantages already before them.

*The Comedies of Aristophanes, translated into familiar Blank Verse; with Notes, &c.* By C. A. Wheelwright, M.A., formerly of Trinity College, Cambridge. To which is added, A Dissertation of the old Greek Comedy, from the German of Wachsmuth. 2 vols. Oxford, 1837. Talboys.

THERE seems to be a determination among the scholars of the present century to indemnify this great comedian for the silence, approaching to neglect, which he so long experienced from the learned. His works are now before us in every variety of shape; essay follows essay, and one translation is but the herald of another. Having so lately twice had occasion to examine the nature and character of the productions of Aristophanes, there is no need at present for any dilution upon his merits. We think, however, they were brilliant enough to entitle him to a better translator than Mr. Wheelwright. This gentleman, perhaps, after the excellent performance of Mr. Mitchell, comes before the public under a disadvantage, and we fear that the trouble and attention which he has evidently unsparingly bestowed upon his author, have been somewhat misapplied. His notes and preliminary observations, though nothing is left for discovery on the subject which he has selected, are accurate and useful, and his chronological table valuable in its details; but the version of the comedies themselves is, in many places, any thing but rhythmical, and possesses throughout a tameness and sobriety very different from the spirited, witty, and extravagant flashes of his original. We hope, however, before long to see Mr. Wheelwright's talents and application directed to some more fitting channel, and exercised in a more congenial occupation.

#### MISCELLANEOUS.

*Don Juan.* By Lord Byron. 2 vols. Vol. I. London, 1837. Murray.

AN amusing forty-odd pages of an *Olla Podrida* of the opinions of a host of critics, reviewers, and other various writers upon this celebrated production, is prefixed to this small, new, and neat edition. Notes for almost every page add much to its interest, and illustrate the poem in the most apposite and agreeable manner.

*Appendix to Elements of Architectural Criticism, in a short Notice of the Foreign Quarterly Reviewer.* By Joseph Gwilt. Pp. 23. London, 1837. Williams.

LIKE all Mr. Gwilt's writing, able and pungent. As an architect he is master of his subject; and the soundness of his judgment in questions of this kind is on a par with the correctness of his taste. Though we are not quite so Palladian as he is, and prefer the Tudor to all other styles for building in England, be the edifice cottage, villa, house, church, or palace, we are not the less sensible to the justness of his remarks upon every point he handles, whether directly or incidentally.

*An Introduction to Hospital Practice, in various Complaints, &c.* By C. J. B. Aldis, M.D. 8vo. pp. 150. London, 1837. Longman and Co.

To this very meritorious and useful work we offered the testimony of our approbation when it was originally published. Dr. Aldis has now

improved it by the addition of a valuable appendix, in which cerebral congestion, apoplexy, palsy, epilepsy, and other diseases are mentioned, with many cases of their successful treatment.

*Encyclopædia Britannica*, Vol. XV. Part II. Edinburgh, Black; London, Simpkin and Marshall; Whitaker and Co.; Dublin, Cumming.

PROFESSOR NAPIER is proceeding rapidly, and not according to the proverb, with the more haste the less speed; but truly and ably towards the completion of this great work. 'This Part contains from "Money" to "Navigation," and has some excellent remarks on human mortality. The article Napoleon is sufficiently favourable. His ambition is called a "glorious fault;" alas! how much "human mortality" did it cost! and his apology is quoted in the dramatic words of Mahomed:—

"Je fus ambitieux;  
Mais jamais roi, pontife, ou chef, ou citoyen,  
Ne conçut un projet aussi grand que le mien."

*Standard Novels*, Vol. LIX: *Philip Augustus*. By G. P. R. James. London, 1837. Bentley.

MR. JAMES candidly says, that he esteems *Philip Augustus* to be the best work he has written; but we are such admirers of all his productions, that we are unwilling to allow this pre-eminence. It must, nevertheless, be admitted, that among the foremost historical novels of the day, this story, now handsomely done into a single volume, must take a very high rank for verisimilitude, research, and interest.

*Narrative of the Melancholy Shipwreck of the Charles Eaton*, &c., by T. Wemyss. Pp. 49. (London, Groombridge; Edinburgh, Patterson; Stockton, Robinson.)—The wreck of this vessel, and the massacre of the passengers and crew, by the savages in Torres Straits, are facts familiar to every newspaper reader. The details here given are, we presume, in accordance with other statements; though we regret to observe considerable clashing and contradiction in accounts of this kind. Here, as only a boy, Ireland, and the child of Capt. and Mrs. D'Oyly, were saved, there was little room for diversity of relation. The narrative is a distressing one; but as the attention of ministers has been turned to the circumstance, it is to be hoped that the best means will be adopted to guard against such disasters in future. In the midst of our horror we could hardly refrain from laughing at some of the writer's religious phraseology; such, for instance, page 46, as his exclamations, "how mysterious are the ways of Providence, and how circuitous his method of dealing!"

#### ARTS AND SCIENCES.

*British Association for 1838*.—We observe it announced, that the town authorities and inhabitants of Birmingham, as well as those of Newcastle-upon-Tyne, have resolved to put in their claim to the distinction of entertaining the British Association next year.

#### LIVERPOOL MEETING.

THE Sections at the Liverpool Meeting are appointed to be held—

A. Mathematics and Physics .....	In the Mechanics' Institute, Mount Street: where, also, the Model Room.
B. Chemistry .....	
C. Geology .....	
G. Mechanics .....	
D. Zoology and Botany .....	Royal Institution, Colquitt Street.
E. Medicine .....	Medical Inst. Mount Pleasant.
F. Statistics .....	Savings Bank, Colquitt Street.
Evening Meetings ..	Two Promenades, &c. Town Hall.
Ordinary .....	Four Secretaries' Reports.
	Lectures, &c. Amphitheatre.
	Lucas's Rooms.

All these places lie most conveniently contiguous, and are capable of furnishing ample accommodations.

#### GEOLOGICAL SOCIETY.

WEDNESDAY, June 14, Rev. Wm. Whewell, president, in the chair.—A letter was read, addressed to C. Lyell, Esq. from Dr. McClelland, who had been associated with Mr. Griffith in the scientific expedition sent by

the Indian Government, under the direction of Dr. Wallich, to investigate the natural history of the country, and the circumstances under which the tea-plant is found wild in Upper Assam. Some high land was seen between the channels of the Ganges and Burrampooter rivers; at the foot of the Kossiah Mountains, or that portion called the Garrow Hills, rounded knolls are interspersed throughout the partially inundated plain; and are composed of layers of sands, clays, gravels, and boulders, appearing to be the remains of a talus of great extent, which had been partially swept away by the great hill-streams. The foot of the mountains is composed of a rock in which *nummulites* are found. On ascending the mountain acclivity, over limestone and sandstone rocks, to Cherra Ponji (a station established at an elevation of above 5000 feet), and reaching a height of 1500 feet above the level of the sea, the author discovered a stratum filled up with shells and marine exuvie, two feet thick, reposing upon sandstone, and covered by soil which resembled a well-defined marine beach. Several hundred specimens were, and many thousands might have been, obtained. The species were about a hundred in number; and when compared with about an equal number from the Paris basin, no less than twenty species were found to be identical in the two collections. The sandstone higher up the mountains than this deposit, contained the impressions of shells and other organic remains. On this sandstone reposes a deposit of compact limestone, from which thirty-seven species of shells were extracted; consisting of species of *trochites*, *cerithia*, *modiola*, and of *Pileolus plicatus* of Sowerby. On this formation reposes a bed of coal to the depth of about twenty or thirty feet, in which remains of an exogenous plant were found. On crossing the mountain towards the centre of the group, the sandstone on which the limestone and coal-rest at Cherra Ponji was found for fifteen or eighteen miles, forming, in horizontal strata, lofty undulating lands. Beyond this the strata displayed marks of confusion; and in the first deep-river valley, a mass of greenstone was found with the adjoining sandstone, tilted up in highly inclined tabular masses, and compact and glassy, in the neighbourhood of the greenstone. Beyond this (the Boga-pani) all traces of sandstone disappear, and the centre of the mountains, from Mufong to the highest ridges, is composed of syenite. Granular quartz, in slaty and vertical strata, is found in contact with this, and displaying progressive changes to the sandstone. The northern side of the mountains from Mufong into Assam, is composed of granular, foliated felspar, penetrated by quartz veins. Extensive beds of syenite and central nuclei of granite are found as far as the valley of Lower Assam. Hot and salt-springs were met with. It was at the base of the mountains that fossil bones were observed by the late Mr. Scott. The author also collected about a hundred and sixty species of the animals, chiefly birds of the forest of Assam, as well as a hundred and twenty species of the fishes of the Burrampooter. A paper was then read on the remains of a fossil monkey from the tertiary strata of the Sewalik Hills, in the north of Hindoostan, by Capt. P. T. Cautley, F.G.S., Bengal Artillery, and Hugh Falconer, M.D., Bengal Medical Service. In this communication, the authors minutely describe, and compare with that of the *Semnopithecus entellus*, an astralagus which had been found in the fossil state, as already mentioned in the letter

from Capt. Cautley to Dr. Royle. Though they have for some time possessed this specimen, they were unwilling to risk the announcement on any thing less characteristic than the cranium and teeth. Messrs. Baker and Dura, of the Bengal Engineers, have since found a considerable portion of the face, and the whole series of molars, of a quadrumanous animal, belonging to a much larger species than theirs. The fossil astralagus is that of the right-hand leg; and was sent, as well as that of a recent *S. entellus*, with the paper. The former was completely mineralised, having a specific gravity of about 2.8, and appearing to be impregnated with hydrate of iron. Although only a solitary bone of the foot, the relations of structure are so fixed, that the identity of the fossil is as certain as if the entire skeleton had been found. This astralagus closely resembles, in size and general form, that of the recent *Semnopithecus entellus*; but the points of difference are sufficient to leave no doubt about a difference of species. In the debris, or different beds of the formation which yielded the quadrumanous fossil astralagus, the authors have also discovered the remains of a species of *Anoplotherium*; also of the crocodile and garial, which now inhabit the Ganges. The camel, antelope, and anoplotherium, have been exhumed from the same bed. The elephant, mastodon, hippopotamus, rhinoceros, hog, and horse, have been found in the same formation with the *Sivatherium giganteum*, armed with four enormous sheathed horns. With these have been found several carnivora. Of the feathered tribe, there are huge grallæ; of reptiles, besides those already mentioned, there are other crocodiles and testudinata, both of enormous size.

#### ZOOLOGICAL SOCIETY.

THE usual monthly meeting was held on Thursday afternoon, W. S. Macleay, Esq. in the chair:—A great number of fellows were elected into the Society. Balance carried to account on the first of September, 862*l.* 4*s.* 5*d.* In pursuance of a resolution of council on May 3, the sum of 320*l.*, being the amount received from compounders, from January to June last, has been invested, in the Society's name, in the reduced 3 per cents. Many valuable donations were announced. The visitors to the garden and museum, in July and August, amounted to nearly 56,000. The stock, to the 31st of August, comprised 293 mammalia, 731 birds, and 21 reptiles; total, 1045. A communication from Viscount Melbourne was made; it stated that her Majesty had been graciously pleased to signify her consent to become the patroness of the Society. Amongst the donations was a red lobster (unboiled!). The remarkable difference in colour may be considered analogous to a variety in the plumage of birds, and as arising from unhealthy secretions: there is one in the museum of a collector, in Cambridge, which is half red, half blue.

#### LITERARY AND LEARNED.

##### EGYPT AND INDIA.

*Notes from Suggestions to Travellers via Egypt to England, in the "Bengal Hurkaru."*

"*Alexandria*.—The first Egyptians who will present themselves to his view on landing, indeed, before he is fairly landed, are a number of ragged urchins, shoving miserable donkeys into the water towards your boat, displaying their whole knowledge of our language in bawling out, 'very good jackass, very fine jackass!' Upon one of these said very fine

animals, I recommend him to take a seat, as there is no other mode of conveyance, unless he prefers walking through the dusty streets. There is a hotel in the middle of the town, kept by an Italian, which is somewhat hot from its situation; and another by Mrs. Hume, in a pleasant enough quarter, though dust exists in abundance in all parts of Alexandria. The accommodation in Mrs. Hume's house is not good, the food worse, and one is absolutely devoured by flies. I have seen the food black from them. The charges, too, are high; two and a half dollars, or five rupees a day, per head, for food and lodging, wine and beer extra. Little need be said of Alexandria; there are only two streets, that can be so called, in the modern town. The remains of the ancient city consist of vast mounds of rubbish; and fragments of walls are visible to the depth of thirty feet, where people have been digging for bricks and stones. I should think there was great scope for antiquarian researches in Alexandria, by digging deep enough. From Alexandria the traveller goes by the canal to Atfee, on the bank of the Nile. The canal, at present, is separated from the river by an embankment, to prevent its being choked by the mud and sand of the Nile, which would otherwise rush into it; so one must move into another boat in order to proceed up the Nile to Cairo. I was just twenty-four hours from Alexandria to Atfee. I started next morning, and arrived at Cairo on the third day, though we did not sail at night. The dress of the boatmen consists of a coarse blue shirt, with immense wide sleeves, which are kept out of the way by a string round the shoulders; but whenever there is any particular work to do, they claw off with one hand this solitary garment, and, without hesitation, appear in a state of primitive simplicity. Fine, sturdy, powerful fellows they are, although they live upon the most poor and scanty fare, and, after seeing them, one does not think Michael Angelo's designs exaggerated. Sometimes, by way of fun, they make a waistband of reeds, or grass, or the slender branch of a tree, after the fashion of Ulysses, as described in the 'Odyssey,' appearing before the princess. From what I had read and heard of the Egyptian architecture, I had formed an idea that it was a sort of dumpy monstrosity, a black dwarf to the rest of its kind; but I was most agreeably disappointed. The beautiful proportions of the columns, their majestic height and size, excited admiration. The painting of some of the roofs was the most exquisite thing I ever saw—of the richest blue, studded with yellow stars, the idea and execution alike lovely. The noble portals which stand before the temples and palaces are far superior to any Roman triumphal arch; in fact, no comparison can be made. The tombs of the kings are on the western side of the Nile, five or six miles from Luxor."

The following are among brief but interesting notes as a guide up the Nile:—

"The great pyramid of Saccarah contains a small chamber, with a few hieroglyphics, differing, in this respect, from all others. The arched tomb (now nearly destroyed), proving the pre-augustan existence of the masonic arch, is of the time of Psammetichus II. about B.C. 604. Mit Raheny, a large Colossus of Rameses II., the supposed Sesostris. Mounds and indistinct remains of Memphis. On the right bank are the quarries from which a portion of the stones for the pyramids were drawn. In one part oxen are represented drawing a block placed on a sledge. A little to the south of the modern village is an inclined plane, leading from the

quarries to the river. Right bank.—Beni Hassan; remarkably interesting grottoes of the time of Osortisen, (about B.C. 1740), in whose reign it is calculated that Joseph arrived in Egypt. To see them well, the surface must be slightly oiled; and the paintings explanatory of the trades, amusements, domestic arrangements, &c., of the ancient Egyptians, merit particular attention. In the columns of the best grotto we recognize the origin of the Doric order. In the entablature over the doorway, observe that the ends of rafters are sculptured, instead of mutules and triglyphs. About a mile and a half south is another grotto, a temple of Psahit Bubastis, or Diana, the *Speos Artemidos* (date, Thothmer 3d, 15th century B.C.) The Speos is known by the name of *Stable Antar*. Near it are deposited cat mummies. The pasha's sugar factory, at E'Rosmoon, merits a visit. Left bank.—Ibayda, at corner of mountain: crude brick walls and some grottoes, not very remarkable. After Shekh Said, the mountains go off to the eastward, leaving the river. A little beyond is Til el Amama, to the south of which are the ruins of an ancient town, of which only the brick houses remain. Wilkinson supposes this place to be Alabastron, but, perhaps, without sufficient reason. To the south are grottoes in the mountain, with curious sculpture, and, upon the mountain, is an alabaster quarry. The sculptures represent a king and queen offering and praying to the sun, which shoots forth rays, terminating in human hands, one of which gives the emblem of life to the king. Procession of soldiers, &c. Six miles before Maufaloat, at el Hareh, are ruins of an old town, in a ravine, in which are dog and cat mummies. Near Maabdel, opposite Maufaloat, are crocodile mummy-pits, difficult of access, and dangerous. E'Siout, the capital of the Said, and standing on the site of Lycopolis, merits a visit. The gardens are celebrated. Visit the grottoes in the mountain, if it only be to enjoy the beautiful view, which is, perhaps, unequalled in Egypt. The mummies of the wolf are occasionally found. The remains of the splendid temple of Antaopolis have been sapped and carried away by the stream. A few stones only serve to point out its site at Gau, right bank. Right bank.—Shekh Ered; where a Moslem saint, transformed into the form of a serpent, still performs very wonderful cures upon those who can pay. To the north of the Memnonium is the small temple of Osiris, built, or at least finished, by Rameses II., and remarkable for having had a sanctuary made of alabaster, and for containing the famous tablet of the kings, which, next to the Rosetta stone, has been of the greatest assistance to the students of hieroglyphics. The Necropolis has been robbed to form the collections of Salt, Drouetti, and others.

"*Medeenet Habor*.—A temple-palace, a private palace or harem, and a temple. The harem is very interesting, but partly destroyed. It consists principally of a pavilion in advance of the palace, and in it are some curious sculptures, among which the king is represented playing chess with his ladies. A ladder is necessary. The great temple-palace is remarkable, not only for its architecture, but for the sculptures representing the conquests of Rameses III. (about the 13th century B.C.) These are particularly remarkable in the hypethral court, where there is exhibited, in the northern side, a magnificent pageant, the coronation of the Pharaoh. The whole exterior of the northern side of the building is covered with battle scenes. Among the heaps of hands poured out before the conqueror

are lions' paws. There are also heaps of Phalia. The great lake for the ceremonies of the dead (the hippodrome of the French *savans*) will be best distinguished from the top of the pavilion or harem. There are several other remains, and tombs without number. The distance from Thebes to Kossair is about one hundred and ten miles, which journey we performed in six marches. The road looks like a river of sand, winding between bare rocky hills, which come down abruptly into it. The sand is intermixed with small stones, which make it hard and firm. A buggy may be driven the whole way. Bungalos are procurable, either to Jambo, or Jedda, and sometimes to Moeha; the Keis, however, gives nothing but fire and water. The cabins of these boats are comfortable in one respect—they are free from vermin; some of them you can even stand upright in, and they sail well. At Jambo and Jedda excellent water is procurable; but one cannot calculate upon other supplies than rice, flour, and a few fowls. Passages, in good vessels, are always procurable at Jedda, from March to July, either to Bombay or Calcutta."

The writer takes a discouraging view of Egypt and its government, and then adds:—

"Much is talked of Egypt being the high road to India, and its vicinity to our eastern possessions; all which I regard not, as, let it be in whose hands it may, our fleet in the Mediterranean, and a few ships in the Red Sea, and Straits of Babel Mandel, will always enable us to dictate to Egypt, or ruin it. The French have Algiers; the Russians lord it in the Black Sea and at Constantinople, are paramount in Persia; and we ought either to have Egypt for ourselves, or let it fairly be under its own ruler. If it gets into the hands of the Russians, we shall soon discover that these Christians hate us worse than any Turks can do. Muhummud Allee merely obtained and retained his power by being the only person awake in his kingdom. He never commits what he considers useless cruelties, though it is observed, that people who stand in his way are not long-lived. In religion, he is, I believe, a latitudinarian; he does not consider it necessary to follow the principles of his faith, in the matter of strong liquors, nor, indeed, do any of his subjects, as, whenever they can get it, they drink most furiously; in fact, travellers will find pint bottles of brandy and wine most acceptable presents; also, beer for the scrupulous: there can hardly be a better circulating medium for Egypt. The old gentleman made rather a witty speech to some of his genial companions, telling them he wished they would 'only drink like Christians.' He limits himself to four or five bottles of the best French claret daily. Though with one foot in the grave, he has immense harems; and, old as he is, the most agreeable present that can be made to him is a handsome female slave. His daughter, aware of his weakness on this head, frequently gratifies her father by gifts of the kind."

#### FINE ARTS.

##### NEW PUBLICATIONS.

*On the Beautiful, the Picturesque, and the Sublime.* By the Rev. J. G. Macvicar, M.A. London, 1837. Scott and Co.

THIS is an able dissertation on a theme that has given rise to essays so numerous. After an eloquent opening chapter on the importance of the subject, Mr. Macvicar cleverly distinguishes between the definition applied to the term beautiful by philosophers, and that given by people in general. We quote his words:—

"It is maintained, on the one hand, that beauty is merely an emotion of the mind; on the other, that it is an external object of regard. This difference of opinion arises partly from the confusion in which our minds naturally are about such matters; partly from the influence of the law of imputation, of which I shall presently have occasion to speak; and partly from the insufficiency of language, which, being framed in relation to the confusion alluded to, proves inadequate to express, without occasional obscurity and seeming paradoxes, the views and ideas which result from philosophical analysis."

The author's classification of beauty is, at the same time, lucid and interesting. We should have much pleasure in extracting from it, but to do so with justice is impossible; we must refer the reader to the whole chapter. The following is a fair specimen of the author's style: he is illustrating the assertion, that the greater the scale of the lines of beauty in the contour of a beautiful object, the greater the energy and grandeur:—

"Look up to the canopy, does it not owe very much of its grandeur to the vast continuous sweep which it takes of the infinite heavens? Suppose that, instead of being one immense dome spanning the universe, the sky were composed of a multitude of little hemispherical domes united together, so as to form a curious system of pavilions, would it not, in being so compounded, lose almost all its present grandeur—at least, until the mind lost sight of the little curves which constituted it, and resumed its sweep of the heavens? Look at a majestic ship, becalmed on the face of the deep, her sails all motionless and hanging vertically downwards on her idle masts: how grand, how solemn, how fitful her expression, compared with what it is when the breeze springs up and bends her sails and makes her stoop? Look at the judge standing upright in his columnar wig and robe: how severe, how judicial, his aspect, compared with what it is when he appears in the drawing-room, figuring in all the waving lines of attitude, back, neck, head, and whole figure! Look at the preacher, robed in the simple drapery and hanging folds of a black gown: how apostolic and commanding his appearance, compared with what it is when he mounts the pulpit, habited in all the particular cuts and curve lines of a dress-coat! The same principle will be found to hold universally."

This volume, on the whole, proves Mr. Macvicar to be an elegant and refined scholar, and a writer of research and thought. We were particularly interested in his book from the recollection of having perused, a few years ago, with much pleasure, a work on the same subject, though differently handled, by Monsieur Bertrand, the learned professor of rhetoric in the Royal College of Caen.

*Engravings from the Works of the late Sir Thomas Lawrence, P.R.A. Part IV. Hodgson and Graves.*

Of the different graphic publications periodically laid upon our table, there is no one the appearance of which we hail with more satisfaction than this. Whatever may be our occupation at the time, we cannot resist the temptation of suspending it, for the purpose of enjoying the treat which we know awaits us. From this pleasure there is but one drawback; we are at a loss to vary our terms of admiration. The present part contains the portraits of "the Emperor of Austria," "the Countess of Blessington," and "Lord Ashburton." They are all fine; but the first-mentioned (a

whole-length) is the most remarkable, as shewing the great skill with which Sir Thomas communicated to his representations of but very indifferent subjects, qualities which render them exceedingly attractive to the eye of taste. The face and figure of Francis are on a small scale, and the uniform in which he is dressed is almost grotesque; yet, by a happy selection of attitude, and a judicious breadth of effect, the portrait and its accompaniments have an air of magnificence truly regal. Of graceful and voluptuous female beauty, the late president was the chosen painter: need we say how successful he was in his portrait of Lady Blessington? His half-length of Lord Ashburton exhibits the simple and unaffected, but dignified English gentleman. G. H. Phillips, S. Cousins, A.R.A., and C. E. Wagstaffe, are entitled to the highest praise for the manner in which they have executed these charming plates.

#### ORIGINAL POETRY.

Having received the permission of the anonymous writer of the following (who tells us he is "a young, uneducated, and inexperienced scribbler"), to make the very few verbal alterations we requested, it affords us no small pleasure to introduce E. C. to the readers of the *Literary Gazette*, by two short poems; the first, in our opinion, breathing the nature and sweetness of Burns; and the last, a spirit unsurpassed in naval song. In justice to the poet, we should say, that the whole of our alterations consist of just the change of one word, and the addition of one syllable omitted in the MS.—*Ed. L. G.*

#### BUTTERCUPS AND DAISIES.

I NEVER see a young hand hold  
The starry bunch of white and gold,  
But something warm and fresh will start  
About the region of my heart.  
My smile expires into a sigh;  
I feel a struggling in the eye,  
'Twixt humid drop and sparkling ray,  
Till rolling tears have won their way;  
For soul and brain will travel back  
Through memory's chequer'd mazes,  
To days when I but trod life's track,  
For Buttercups and Daisies.

Tell me, ye men of wisdom rare,  
With sober speech and silver hair,  
Who carry counsel, wise and sage,  
With all the gravity of age;  
Oh! say, do ye not like to hear  
The accents ringing in your ear,  
When sportive urchins laugh and shout,  
Tossing those precious flowers about,  
Springing, with bold and gleesome bound,  
Proclaiming joy that crazes,  
And chousing the magic sound  
Of Buttercups and Daisies?

Are there, I ask, beneath the sky,  
Blossoms that knit so strong a tie  
With childhood's love? Can any please,  
Or light the infant eye like these?  
No, no, there's not a bud on earth,  
Of richest tint or warmest birth,  
Can ever fling such zeal and zest  
Into the tiny hand and breast.

Who does not recollect the hours  
When burning words and praises  
Were lavish'd on those shining flowers,  
Buttercups and Daisies?

There seems a bright and fairy spell  
About their very names to dwell;  
And, though old Time has mark'd my brow  
With care and thought, I love them now.  
Smile, if ye will, but some heart-strings  
Are closest linked to simplest things—  
And these wild flowers will hold mine fast,  
Till love, and life, and all be past:

And then the only wish I have  
Is, that the one who raises  
The turf sod o'er me, plant my grave  
With Buttercups and Daisies.

E. C.

#### THIS IS THE HOUR FOR ME.

I'LL sail upon the mighty main—but this is  
not the hour, [in lady's bower:  
There's not enough of wind to move the bloom  
Oh! this is ne'er the time for me: our pretty  
bark would take [lake;  
Her place upon the ocean like a rose-leaf on a  
There's not a murmur on the ear, no shade to  
meet the eye; [the sky:  
The ripple sleeps; the sun is up, all cloudless in  
I do not like the gentle calm of such a torpid sea;  
I will not greet the glassy sheet—'tis not the  
hour for me.

Now, now the night-breeze freshens fast, the  
green waves gather strength,  
The heavy mainsail firmly swells, the pennon  
shews its length,  
Our boat is jumping in the tide—quick, let her  
hawser slip; [giant ship.  
Though but a tiny thing, she'll live beside a  
Away, away! what nectar spray she flings about  
her bow, [upon my brow:  
What diamonds flash in every splash that drips  
She knows she bears a soul that dares, and loves  
the dark rough sea.  
More sail! I cry; let, let her fly!—this is the  
hour for me.

E. C.

#### SKETCHES.

*Extract of a Letter from Mr. Russegg, Director of the Austro-Egyptian Mineralogical Expedition.*

Gartoum, in Sennaar, March 17.

HERE I sit, in Sennaar, forming plans, and thinking, at intervals, of my own dear country, which, however, is very far off, Cairo being but just halfway. When I left Cairo, I was finally resolved not to lose sight of an enterprise from which great gain might accrue to the viceroy and honour to myself, and by which I might likewise succeed in stopping many a wicked tongue; I mean the working of the rich gold mines in the interior of Africa. My journey to this place was very interesting, but fatiguing. I passed through all Egypt, stood on the ruins of Tentyra, Karnac, Luxor, Kenne, &c.—the remains of vanished incomprehensible grandeur and magnificence; visited the Cataracts, and the granite rocks of Syene, and proceeded on my journey through Nubia. I went on the Nile as far as Korosko, but from that place proceeded directly across the Great Nubian Desert to Abou Hamed, by a route never yet trodden by any European whose travels had a scientific object. Every desert has its terrors, but this especially, from its extraordinary scarcity of water. Our beverage, for the latter days of our journey, was a dirty, brackish, warm lye, to which the skins had communicated an intolerable stench; yet we frequently drank of it, for we were riding in a temperature of 37° to 38° by Reaumur's thermometer (115 to 117 Fahrenheit). He only has an idea of the desert who travels through it; and he only knows the truly heavenly pleasure with which the traveller, fainting with thirst and heat, makes his dromedary kneel, when, instead of the delusion of the devilish "Fata Morgana," he beholds the real waves of the stream before him. We were near losing some of our blacks, who can bear but very little fatigue, but happily lost only some camels. From Abou Hamed, we rode through the whole land of the Berberes; but

from El Mekeheiref, I again navigated the Nile to Gartoum, in Sennaar. With respect to mining affairs, little has been done. I proposed to the viceroy to bore for water in the desert, which would certainly be attended with success. My geological and physical observations are very interesting. I have collected data for geological maps of Upper Egypt and all Nubia (the latter, a land wholly unknown in this respect). I shall add to these data on my return along the Nile, and am already anticipating the pleasure which I one day shall have in arranging them. The results of the physical observations were no less interesting, and, especially, the conclusions from the observations on the pressure of the atmosphere and the aerial currents indicate a fixed order, and a regularity in these phenomena, of which there is no example out of the torrid zone. After the rainy season, I shall go up the White Nile, proceed to Kordofan, and visit the gold mines of Gebbel-Nubah, near Schechun, and shall then wait during the rainy season here, in Gartoum; and after that proceed southwards on the Blue Nile, visit the rich gold mines of Fas-ogin, and advance as far to the south as I possibly can. With God's protection, I shall see you again in a year, as I shall go to Cairo before I set out for Arabia. My assistant, Ruckner, the bearer of this, is going back to Mount Taurus, in Asia Minor, in order to prepare, meantime, the melting of the lead ore in Gulek.

*Notes on Dr. Spry's India.\**—The existence of the *Kokis* was known from forty to fifty years since, and, by official reports, to the government of the day; but their living in trees is a mere amplification, true only of scouts, hunters, or accidental wanderers, but not of permanent habitations. The fact is, that this race, being wholly uncivilised, have a great objection to being eaten, either by their brethren, or by other wild beasts; they select, therefore, mountainous and difficult situations for their established residence, fortifying the entrances with a kind of stockade, and keeping watch, day and night, to guard against surprise from hungry visitors, biped or quadruped. The houses, or huts, are built on a rude scaffolding, at some height above the ground, as is practised in other parts of the country by the *Thugs*, &c.: sometimes as a precaution against floods. These savages seem as rude and helpless as the old Scythian Anthropophagi, whose descendants they probably are, for it would be difficult to find any part of the world where the remains of the Scythic tongues are so well preserved as throughout Further India; take, for instance, the names Chittagong, or Che-Tagong; Rakkam, Roshan, Burmah, &c. &c. If the Indian women never read or write, how came seven of them to write the code, or kitab of Kuslum-Nameh, quoted in this very passage, within a dozen lines? to say nothing of Indian history, which would be tolerable authority on the subject. But is the author not aware that this code, or kitab, so gravely quoted, is only a satire?

The existence of wild men, or *jungle-kee admee*, involves a difficult point. The Dr.'s opinion seems formed upon accounts of European savages, like Peter the Wild Boy, and the Savage of Aveyron; but along the wild frontier of Hindoostan, similar cases have occurred; and, however easy it may be to set them down as idiots, and disregard

the accounts of the keepers, who may, it is true, exaggerate, no one questions the fact, that such unhappy beings are found at times, in societies of two or three, and in the state of degradation described. Science, no less than humanity, would claim for them a removal from dens or forests, and an investigation into their real condition. They are said to possess a certain portion of intelligence, equal, or superior to that of brutes; and since these last have, in different degrees, the powers of memory, combination, and reasoning, or judgment, i. e. to a certain limit; it might be worth examining whether isolation, rather than idleness, be not the cause of the degradation referred to, and how far this is remediable.

## OWEN REES, ESQ.

WE had written the notice which follows this, when accounts were received in town of the death of Owen Rees, Esq., late, and for a long period of years, one of the principal partners in the extensive house of Messrs. Longman and Co. It was only at Midsummer that Mr. Rees, after a period of more than forty years of great responsibility, retired from the cares and anxieties of business, with the prospect of enjoying his remaining years in repose, at his beautiful residence in Wales, where he had done much, not only to improve his own estate, but to introduce valuable improvements into the surrounding country. Previous to his leaving town, an entertainment was given to him, as a tribute to his integrity and gentlemanly conduct; and above forty of his oldest friends and associates assembled to pay this gratifying compliment. And few men in the metropolis, perhaps, ever had larger opportunities of cultivating the acquaintance and intimacy of men distinguished in all the walks of literature. Moore's Works, Scott's Works, and, indeed, a number of the works of the principal authors of the age, bear testimony to the important share Mr. Rees had in bringing forward their productions, and of the friendly intercourse which subsisted between them and him. Mr. Rees was a warm patron of the drama, and an acute and excellent dramatic critic. He had, we believe, been unwell for a few weeks, and thought his native air might restore him to health and strength. But, alas, for human hopes! he gradually declined, and at last yielded to fate, on Tuesday, the 5th. Mr. Rees was about 66 or 67 years of age, and unmarried.

## MR. SHERWOOD.

MR. WILLIAM SHERWOOD, well known as an old and respectable publisher, died at his house, at Holloway, on Wednesday, the 6th. He was a man of kindly dispositions, and ever ready to do a good turn to those within his sphere of action. Lately he had been doing a large share of business, of which the burden, perhaps, led to his premature death, for he was not past the age of 60 or 61. About a fortnight ago he was struck with apoplexy, and lingered to the day we have specified. His loss will be felt by many with whom he was connected in trade, as well as by his numerous family.

## WILLIAM DANIELL, ESQ. R.A.

In our 1074th Number, we mentioned the death of Mr. Daniell, and briefly adverted to his many excellent qualities, both as an artist and as a man. We have been favoured with the following interesting little memoir of Mr. Daniell, from an authentic source.

It is with sincere regret that we have to record the death of Mr. William Daniell, R.A., which took place on the 16th of August, after

four months of the most dreadful suffering. The lovers of art will, doubtless, read with interest the following brief sketch of his professional life; a life dedicated, with the most unremitting perseverance, to that profession of which he was so bright an ornament. Mr. Daniell's career began when he was quite a youth, for at the age of fourteen, he accompanied his uncle, who is still living, to India, for the express purpose of assisting him in depicting the scenery, costume, and every thing connected with that interesting country; his early drawings and sketches are so admirable, that it would almost seem as if drawing had been with him an intuition. During the ten years of their absence from England, the uncle and nephew travelled many thousand miles, commencing their arduous journey at Cape Comorin, and closing it at Serinagur, in the Himalaya Mountains; in the course of their progress, traversing many hundred miles of country before untrodden by Europeans, and bringing home an immense mass of information of every kind. Immediately on their return, the large work, entitled "Oriental Scenery," in six folio volumes, was commenced and continued with the most persevering ardour until its completion, in 1808. Amongst the works engraved and published by Mr. Daniell, from 1801 to 1814, were, "A Picturesque Voyage to India;" a work entitled "Zoography," in conjunction with Mr. William Wood, F.S.A. and F.L.S.; two volumes of "Animated Nature;" the series of views of "The Docks;" the story of "Hunchback," engraved from pictures painted by Mr. Smirke, R.A.; together with a vast variety of unconnected subjects, besides very many pictures and drawings. In 1814, Mr. Daniell commenced the "Voyage round Great Britain"—a most gigantic undertaking for one unassisted individual. Two or three months in each summer were devoted to collecting drawings and notes. The work was finished in 1825. Few are aware of the dangers and difficulties which Mr. Daniell experienced during his solitary journeys round our rock-bound coast. Immense fatigue, exposure to weather of all kinds, wretched fare, and still more wretched accommodation, were his constant attendants; and had it not been that he was occasionally cheered by the hospitality he received from those to whom he had letters of introduction, the task would have been almost impossible. In 1832, Mr. Daniell, and his highly gifted friend, Mr. Parris, executed the Panorama of Madras; and subsequently, Mr. Daniell painted two others, entirely without assistance, namely, the City of Lucnow, and the Mode of hunting Wild Elephants. This lamented artist was particularly successful in the fidelity with which he depicted the mighty ocean, in all its aspects of turbulence or of calm. This is sufficiently attested by the series of storms, under a variety of circumstances, which he engraved and published, and by his numerous paintings and drawings. It is, however, impossible, in the small space which we have allotted to ourselves, to notice all the works of this excellent artist; but we cannot help adding our hope that Mr. Daniell has left drawings for the continuation of the "Oriental Annual," a work deservedly ranking high among that class of periodicals to which it belongs, whether we consider the beauty and fidelity of the drawings, the admirable manner in which the gentlemen engaged have transferred the subjects to steel, or the interesting information conveyed in the text.

That Mr. Daniell had not declined in his art, will be acknowledged by those who recall

\* We owe these notes to a gentleman well read in Indian matters; and insert them as a pendant to our review of Dr. Spry's work.—Ed. L. G.

the beautiful pictures he sent to the last Exhibition of the Royal Academy. Always chaste and elegant in design and feeling, he had, during the last few years, added a richer tone of colouring, which rendered his works much more attractive; indeed, never did his energies exhibit more vigour than when he was attacked by the disease which has terminated so fatally.

Mr. Daniell was honoured with the friendship of his majesty, King Louis Philippe, and received several flattering marks of his majesty's regard. One of his best pictures, "A View of the Long Walk at Windsor," is in his majesty's private collection.

By Mr. Daniell's family his loss will be long and severely felt: he was possessed of a contented disposition, and, with the feeling that suffering was the lot of all, he bore his disappointments, troubles, and losses (of which he had many), with fortitude and resignation. His great aim was to make all around him happy; and the fearful blank which his absence creates, proves that his aim was realised. Respected and beloved by his friends, his animated manners, cheerful conversation, and vast fund of anecdote and information, will long be missed; and he has left none who can convey to the public, in an equal degree, the glowing representations of eastern scenery and character.

#### MUSIC.

*The Bright, Bright Wine; The Warrior's Home; The Rose, the Queen of Flowers, a Ballad; A Wealthy Old Man a Wooing did Go.* The Poetry by Percival Farren, Esq.; the Music by T. German Reed. Purday.

We liked these songs much when we heard them sung at the Haymarket Theatre, where frequent encores shewed the public in general were of the same opinion. We have only to say that, for the drawing-room, they will be found great acquisitions. *The Bright, Bright Wine*, is one of the most agreeable and spirited compositions we have of late met with. *The Warrior's Home* is also very sweet.

*Prelude and Fugue in A Major, for the Organ, with a Part for the Pedal Obligato.* By Egerton Webster. Novello.

A STERLING piece of composition. Harmonious, and one that will take a first place amid the best sacred music of the age. Some passages are exceedingly beautiful. A feeling dedication to a dear father is shewn, to our minds, as musical as the crotchets and quavers; but this is a matter of taste, and, to our organ-playing friends, we dare say the latter will be found the most acceptable.

*First Set of Fashionable Quadrilles.* By Frances Amelia Diball. Boosey and Co.

An easy and pleasant set of quadrilles. The second and last are particularly good; but they scarcely need our praise, as we perceive they have already reached a third edition. Still, though perhaps a little late, we may be permitted to give our word of commendation and recommendation to Diball's first, and we hope not last, set of quadrilles.

*The Jim Crow, or Columbian Quadrilles.* By J. T. Craven. Purday.

A most lively collection of well, too well, known airs, scarcely solemn enough for the present style of "quadrilling it," as those who dance to this set must assuredly "jump Jim Crow." For parties, and young and merry folks, we could scarcely recommend a better selection.

#### DRAMA.

*Haymarket.*—Mr. Farren's benefit, on Mon-

day, we are happy to say, was a bumper. No actor on the stage is more deserving of public favour than this gentleman. Mr. Power's comedy, *St. Patrick's Eve*, has been successfully revived, himself sustaining the principal character.

*English Opera.*—*The Exile of Genoa*, a short opera, was produced at this theatre on Monday. It, or, at least, something very like it, has, we think, been played elsewhere. Some pleasing music will, probably, cause it to grow in favour, and two sweet national airs particularly pleased us. A fine chorus of Weber's was sung in a superior manner, and most justly encored. Mr. E. Seguin sang an air, *à la* Phillips, with good effect. Mr. Fraser, also, executed some sweet music with much taste. Miss Rainforth both played and sung delightfully. We would suggest, if it could be easily managed, the introduction of another, or two simple ballads or songs, and the curtailment of some of the rather long scenes of Miss Rainforth. We should mention a sweet trio between Miss Rainforth, Fraser, and Seguin: it was beautifully done.

*Strand.*—A new farce, called *No Followers*, was produced on Monday. Its success was ensured by the clever acting of Miss Daly, as a servant; and of Mr. Hammond, as a black footman.

*Colosseum.*—The evening entertainments at the Colosseum terminated last night. The season has, we believe, been prosperous, though the weather was not very favourable at its commencement. Mr. Braham will, of course, be making preparations for the ensuing campaign at the St. James's Theatre.

#### VARIETIES.

*Cariotures.*—No fewer than six H.B.'s have flushed upon the town this week (Nos. 496 to 501), chiefly bearing on the recent elections. The first is a whole-length of Dr. Bowring, as "the rejected of Kilmarnock;" a laughable personation. The next is "an extraordinary likeness," viz. Sir H. Vivian on the easel of Sir H. Hardinge, with the Duke of Wellington praising the execution; "there he is to the life! turning his back on his old friends." The third is "an awful scene from Tom Thumb;" the King of Hanover throwing a cushion at the apparition of Gaffer Thumb! i.e. the late king holding up "the Constitution of 1833" on a pitchfork. The fourth is much better, and represents O'Connell as agent for the Great Western Booking-office, having sent Hume off to Kilkenny, but telling Roebuck, Buxton, Bowring, &c. &c., that he is full, but if they wait the next train he will try to accommodate them all with seats. Sir J. Graham and Mr. Tennent (the latter not like) are seen on one side. The last two are devoted to Mr. Hume and Kilkenny. In the first he is tumbling out of the Middlesex balloon in a Cocking parachute, and calling for some friendly dunghill to receive him; in the last, O'Connell, as an Irish hodman, is shooting him out of a cart, as "rubbish," into Kilkenny.

*Geology.*—Some opinion has gone abroad that the marks in sandstone, known by the name of horses and colts' hoofs, kelpies' feet, &c. resemble impressions left by Medusæ on the sands of the sea-shore; but the best geologists do not think that these are sufficient to account for the remains in question.

*New Houses of Parliament.*—On Monday next, the three navigable arches of Westminster Bridge, on the Middlesex side of the river, will be stopped, for the purpose of build-

ing the embankment wall for the New Houses of Parliament.

*Mount Todi*, in the Canton of Glaris, the summit of which has hitherto been deemed inaccessible, was lately ascended by three peasants of the neighbourhood.

*Weather-Wisdom.*—The prognostications have been half right and half wrong since our last. "The aspects on the 11th bespeak cloudy and not very settled weather. On the 14th changes again; windy weather prevails. Moist and misty air, with high winds, about the middle of the month."

#### LITERARY NOVELTIES.

We learn with pleasure that Mr. Bowles is preparing for publication a number of his Selected Poems, with "Scenes and Shadows of Days Departed;" and also some Sermons preached in Salisbury Cathedral, Bowood Chapel, and elsewhere. Those at Bowood, we have heard, were on subjects from the Cartoons of Raphael, in the windows of the chapel, presented to Lord Lansdowne by the late king—subjects admirably suited to the poetry and the piety of the preacher.

Mr. Leitch Ritchie is revising for press a posthumous MS. work, entitled "Memoirs of a Man of Genius."

#### LIST OF NEW BOOKS.

The Young Scholar's Latin-English Dictionary, being an Abridgement of the Complete Latin-English Dictionary, by the Rev. J. E. Riddle, M.A., square, 7s. 6d.—A Traveller's Thoughts, suggested by a Tour on the Continent, post 8vo. 4s.—Rogers's Law and Practice of Elections and Election Committees, 5th edit. 12mo. 3s.—My Book; or the Anatomy of Conduct, by J. H. Skelton, post 8vo. 7s. 6d.—The Hunters of the Prairie, or the Hawk Chief, by J. T. Irving, Jun., 2 vols. post 8vo. 12s.—The Taurus; or Doings and Undoings, by C. N. Inledon, 8vo. 10s. 6d.—Schiller's Don Carlos, translated by J. W. Bruce, 12mo. 7s.—Quain's Anatomical Plates of the Vessels, folio, 2l. 14s. plain; 3l. 18s. coloured.—Buquet's Guide to French Pronunciation, 12mo. 3s.—Reid's Introductory Atlas of Modern Geography, 8vo. 7s.—Rev. W. Tiler's Natural History, 12mo. 5s. 6d.—Select Passages from the Sermons of a Clergyman, 4th edit. 7s. 6d.—Interesting Tales by J. H. Stilling, translated by T. Jackson, 12mo. 3s. 6d.—The Christian Sacrament and Sacrifice, abridged from Dr. Brevint, by J. N. Pearson, M.A., 32mo. 1s.—Boileau's Linguist, German and English, new edit. 12mo. 7s.—Letters of the Martry, with a Preface by Miles Coverdale, 1564. Edited by the Rev. E. Bicknell, post 8vo. 10s. large paper, 8vo. 14s.—A System of Mineralogy, by J. D. Dana, A.M., royal 8vo. 21s.—D. Gavin Scott's History of Joint Stock Banks in England, 8vo. 4s.—Oriental Key to the Sacred Scriptures, by M. De Corbett, 18mo. 3s. 6d.—Prayers and Chants, by W. Farman, 8vo. 4s.—Some Recollections of the Last Days of King William IV., 12mo. 1s.—Rev. J. Buchanan's Comfort in Affliction, 2d edit. 12mo. 3s. 6d.—The Two Brothers, a Narrative on the Effects of Education, 12mo. 3s.—Kingly Vale and other Poems, by C. Crocker, 12mo. 2s. 6d.—D. Falkner's Apostolic Church, 12mo. 5s.—C. H. Minchin's Eighteen Sermons, 12mo. 7s. 6d.—J. Rowbotham's Dutches Leebuch: or Lessons in German Literature, 2d edit. 12mo. 8s.—Autumn, by A. Wode, royal 12mo. 5s.—Lyrics, by J. L. Stevens, post 8vo. 10s. 6d.—Ellis's British Tariff for 1838, 12mo. 5s. 6d.—The Vicar of Wrexhill, by Mrs. Trollope, 3 vols. post 8vo. 12s. 6d.—Dr. Peithman's Practical Introduction to the French Language, 12mo. 3s.—T. Martin's Conveyancing, with Forms of Assurance, Vol. II. Part 2, royal 8vo. 25s.

#### TO CORRESPONDENTS.

E. C. will find a letter at the *Literary Gazette* Office. We are much obliged to our Maidstone correspondent for the trouble he has been so good as to take, to prove that the simple principles which we asserted, in the case to which he refers, are correct. There cannot be the slightest departure from them, unaccompanied by error. But we must decline proceeding further with the subject.

## ADVERTISEMENT,

Connected with Literature and the Arts.

## WILL BE SHORTLY CLOSED.—

**DIORAMA, REGENT'S PARK.**—New Exhibition, representing the Interior of the Basilica of St. Paul, near Rome, before and after its Destruction by Fire; and the Village of Alagna, in Piedmont, destroyed by an Avalanche. Both Pictures are painted by J. Chevalier Brouton.  
Open daily, from Ten till Five.

TO ARTISTS, TOURISTS, AND ADMIRERS OF THE FINE ARTS.

**PARLOUR'S PORTABLE SKETCHING-CASE, OR DELINEATOR.** is confidently recommended to the notice of all persons attached to the Science of Drawing, as being infinitely superior to the Camera Lucida, and all other instruments hitherto invented, for the purpose of Sketching. The Sketching-Case may be held in the hand, and a correct Drawing made of any object or landscape; or it may be attached to a table, in the same manner as the Camera Lucida. It is simple in its management, and does not exceed, in size, the common Sketching-Book. Manufactured for the Patentees, by Reeves and Sons, 150 Cheapside; may be had, also, of Smith and Warner, Marylebone Street, Piccadilly; Jones and Son, Opticians, Charing Cross; and at all other Opticians' and Artists' Repositories. Ladies and Gentlemen who have the Camera Lucida may have the Delineator affixed to their own stand.

## ST. GEORGE'S HOSPITAL, MEDICAL SCHOOL.

Session 1887-8.  
The following Courses of Lectures will be delivered in this School, commencing October 5, 1887.  
Theory and Practice of Physic—Dr. Macleod and Dr. Seymour.  
Theory and Practice of Surgery—Mr. Cesar Hawkins and Mr. J. Babinington.

Clinical Medicine—Dr. Macleod and Dr. Seymour.  
Clinical Surgery—Sir B. C. Braide, Bart., Mr. Cesar Hawkins, and Mr. G. Babinington.  
Maternal Medicine—Dr. Seymour and Dr. Macleod.  
Midwifery—Dr. Robert Lee.  
Medical Jurisprudence—Dr. Hope and Dr. Lee.  
Botany—Dr. Robert Dickson.  
Anatomy and Physiology—Mr. Tetam and Mr. Henry James Johnson.

Demonstrations of Practical Anatomy, with Dissections—Mr. H. J. Johnson and Mr. Henry Charles Johnson.  
Chemistry at the Royal Institution—Mr. Brande and Mr. Faraday.

The Introductory Address on the Opening of the Hospital School for the Session, will be delivered on Monday, October 2d, at One o'clock, p.m. in the Theatre of the Hospital.

The Anatomical Lectures and Demonstrations are delivered in the Anatomical Theatre in Kinnerton Street, Wilton Place.  
Further Particulars and Prospectuses may be obtained by applying to the Porter of the Hospital, to the Porter of the Hospital Museum, or at the Anatomical School in Kinnerton Street.

## CAUTION TO BOOKSELLERS AND THE PUBLIC.

**W. KIDD** hereby, for the sixth time, cautions the Public generally, Collectors, and Persons residing in the Country more particularly, against crediting the answers now invariably given by a large establishment in the immediate vicinity of Paternoster Row, to inquiries for his various Publications, such as "Out of Print," "No such Book," &c. &c. In self-defence, W. K. is compelled thus publicly to expose the nefarious "system," which has been shamelessly practised for the last twelve months, and of which complaints from the country are arriving almost daily.  
7 Tavistock Street, Covent Garden, Sept. 9, 1887.

## SALES BY AUCTION.

SOUTHGATE'S ROOMS.

Books in Quires, Boards, and Bound.

By MESSRS. SOUTHGATE and SON,

AT THEIR WEEKLY SALE-ROOMS,

25 FLEET STREET,

ON WEDNESDAY, SEPTEMBER 13, AND FOLLOWING DAY.

India Proofs; Milner's Ecclesiastical Architecture; Chambers's Architecture, by Gwilt, 3 vols.; Compton's Notes, 2 vols.; Walpole's Anecdotes of Painting, India Proofs, 5 vols.; Memoirs de France, the 12 Supplementary Parts; Forbes's Oriental Memoirs, 5 vols.; Gell's Pompeiana, 3 vols. mor.; Turner's Southern Coast, 2 vols.; Henry's Heraldry, 3 vols. l. p.; Gwilt on Shadows; Burne's Works, by Cunningham, 1 vol.; Jeremy Taylor's Works, 2 vols.; Winer's Anatomy; Bland's Anatomy; Gault's Chemistry; Culen's Works; the Works of Shakespeare, Robertson, Blair; Modern Novels; upwards of Fifty Reams of Printing Paper, &c.  
Specimens may be seen, and Catalogues, price 1s. had at the Rooms.

Money Advanced upon Duplicate Portions of Booksellers' Stock, upon Libraries, and on Literary Property in General.

## BOOKS IN THE PRESS.

On Monday, 2d of October, Volume the Fifth of the **LIFE OF SIR WALTER SCOTT.**  
By Mr. LOCKHART.  
Robert Cadell, Edinburgh; John Murray, and Whittaker and Co. London.

Of whom may be had,

The Life, Vols. I. II. III. and IV.

Waverley Novels, 48 vols.

Sir Walter Scott's Poetry, 12 vols.

Sir Walter Scott's Prose Works, 28 vols.

## NEW WORKS preparing for immediate publication.

## I. The Old Commodore.

By the Author of "Rattlin the Reef." 3 vols.

## II. Italy.

By J. Fenimore Cooper, Esq.  
Author of "The Pilot," "The Spy," &c.  
3 vols. post 8vo.

## III. THE LETTERS OF

Lady Mary Wortley Montagu.

Edited by Lord Wharncliffe.  
3d edition, revised, with Additions, in 2 vols. 8vo. with numerous fine Portraits.

## IV. The Squire.

By the Author of "The Merchant's Daughters," "The Heiress," &c. 3 vols.

## V.

The Life of Joseph Grimaldi, Comedian.

Written by Himself.

2 vols. with numerous Illustrations.

## VI.

THE COMPANION TO THE WAVERLEY NOVELS.  
With the Magazines, on the 30th inst., complete in 1 vol. neatly bound, and embellished with Two Engravings by Great-bach, price 6s.

## Rookwood.

By W. Harrison Ainsworth, Esq.

Author of "Ratcliffe," &amp;c.

Forming the New Volume of

The Standard Novels and Romances.

Richard Bentley, New Burlington Street,

Publisher in Ordinary to Her Majesty.

## BOOKS PUBLISHED THIS DAY.

## BUTTERFLIES and MOTHS.

Price 6s. in cloth.

The Natural History of British Butterflies, illustrated by upwards of 150 Specimens, accurately and beautifully coloured.

Also,

The Natural History of British Moths, Sphinxes, &c. Price 6s. with very numerous coloured Plates.  
The above Volumes form a complete Manual of British Butterflies and Moths, containing between two and three hundred Figures, and having the English as well as the scientific names given.

The Natural History of Foreign Butterflies. Price 6s. with upwards of 70 coloured Specimens.

The Volumes may also be had in silk and morocco bindings, price 7s. 6d. or 8s. 6d. by Rev. W. H. Lizards, Edinburgh; S. Highley, 28 Fleet Street, London; W. H. Lizards, Edinburgh; and all Booksellers.

The 13th edition, in 1 thick vol. 8vo. price 12s. in boards.

**ELEMENTS OF CHRISTIAN THEOLOGY.** containing Proof of the Authenticity and Inspiration of the Holy Scriptures; a Summary of the History of the Jewish People; a brief Statement of the Contents of the several Books of the Old and New Testaments; a short Account of the English Translations of the Bible, and of the Liturgy of the Church of England; and a Scriptural Exposition of the Thirty-nine Articles of Religion.

By the late GEORGE TOMLINE, D.D. F.R.S. Lord Bishop of Winchester.

Designed principally for the Use of Young Students in Divinity. Printed for T. Cadell, Strand.

Of whom may be had,

An Introduction to the Study of the Bible; being the First Part of the Elements of Christian Theology. In small 8vo. price 6s. 6d. in boards.

By the late GEORGE TOMLINE, D.D. F.R.S.

Lord Bishop of Winchester.

Designed principally for the Use of Young Students in Divinity. Printed for T. Cadell, Strand.

Of whom may be had,

An Introduction to the Study of the Bible; being the First Part of the Elements of Christian Theology. In small 8vo. price 6s. 6d. in boards.

## PHILOSOPHICAL TRANSACTIONS.

Quarto, with 15 Plates, price 22s.

## THE PHILOSOPHICAL TRANSACTIONS OF THE ROYAL SOCIETY, for the Year 1887.

Part I. Containing the following papers:—1. Researches in the Integral Calculus; Part II., by H. F. Talbot, Esq. F.R.S.—2. Researches towards establishing a Theory of the Dispersion of Light; No. III., by the Rev. S. Fowell, M.A. F.R.S. &c.—3. On the Optical Phenomena of certain Crystals, by H. F. Talbot, Esq. F.R.S.—4. The Ballistic Lecture. Further Observations on the Optical Phenomena of Crystals, by H. F. Talbot, Esq. F.R.S.—5. Observations on the Electro-chemical Influence of long-continued Electric Currents of Low Tension, by Golding Bird, Esq.—6. Inquiries respecting the Constitution of Salts, of Oxalates, Nitrates, Phosphates, Sulphates, and Chlorides, by Thomas Graham, Esq. F.R.S. &c.—7. Researches on the Tides; seventh series. On the Diurnal Inequality of the Height of the Tide, especially at Plymouth and at Singapore; and on the mean Level of the Sea, by Rev. William Whewell, M.A. F.R.S. &c.—8. On the Structure of the Brain in Mammalian Animals, by Richard Owen, Esq. F.R.S.—9. On the Tides, by John William Lubbock, Esq. F.R.S., Vice-Chancellor of the University of London, &c.—10. Further Observations on Volcanic Combinations; in a Letter addressed to Michael Faraday, Esq. D.C.I., F.R.S. &c. by J. F. Daniell, Esq. F.R.S. &c.—11. Analysis of the Roots of Equations, by the Rev. Robert Murphy, M.A. &c.—Meteorological Journal, July to December, 1886. Published by the Royal Society; and sold by Richard Taylor, Red Lion Court, Fleet Street.

Where, also, may be had,

Abstracts of the Papers printed in the Philosophical Transactions, from 1680 to 1880. 3 vols. 8vo. 15s.; or, 3 vols. 4to, 30s.

## ARCHITECTURE AND CIVIL ENGINEERING.

New and very important Works for the Civil Engineer and Architect.

**Wilkins' (Regius Professor) Prolusiones Architectonicæ**; or Essays on Subjects connected with Grecian and Roman Architecture. Part I. royal 4to. in boards, with fine Plates, price 17. 1s.  
Part II. (the concluding) will be published at the end of the year.

**Vicat's Practical and Scientific Treatise on Calcareous Mortars and Cements**, translated, with Notes and Experiments made by Captain Smith, of the Madras Engineers, F.R.S. 8vo. with Plates, price 10s. 6d.

**Barlow on the Strength of Materials, and on Construction.** 8vo. with Plates, price 10s.

**Papers on Subjects connected with the Duties of the Corps of Royal Engineers.** 4to. with Plates, price 15s.

**Provia's Proposed Canal from Middlewich to Aitburgh.** 8vo. large Map, 8s. 6d.

**Transactions of the Institution of Civil Engineers.** Large 4to. with 20 Plates, price 20s. (A few Copies left.)

**Richardson's very interesting Work on Elizabethan Architecture.** 60 Plates, elegantly half-bound in morocco, price 30s.

**Rayner's Haddon Hall, fine Interior and Exterior Views.** 2 Parts, complete, large 4to. 2s. 2s.; large paper, 3s. 2s.

In preparation, and very nearly ready, The most comprehensive and valuable Practical Work yet offered to the Civil Engineer and Student.

**On the Public Works of Great Britain.** In royal folio, 120 Plates, engraved in the best style on copper, by the most eminent Mechanical Engravers, on Railways, Tunnels, Viaducts, Oblique Arches, Railways, Bridges, Canals, Aqueducts, Docks, Harbours, Iron Works, &c. &c., with Descriptive Letter-press. Edited by F. W. Sims, C.E. Half-bound, price 3l. 3s.

**Railways (forming a portion of the preceding, and sold separately) Practically Illustrated.** In 50 Plates, royal folio, engraved on copper in the best style, displaying every Practical Example in the Forming, Construction, and completion of Railways, under every difficulty, in this and other countries. The subjects are selected from Railways in operation and completion; the whole scientifically and historically described; price 30s.

**The Port of London: a Historical, Commercial, and Scientific Survey of the Harbours and Port of London, its Docks, Piers, Quays, Embankments, Mooring, &c.; its Commerce, and its great Resources.** By James Kimes, Surveyor to the Port, &c. &c. Royal folio; engraved in the best style of copper-plates. Price 15s.

**Tredgold on the Steam Engine: a new Edition**, much enlarged, edited by W. S. B. W. House, Esq.; with an Appendix on Steam Navigation, fully developing that very important Science, with Examples of Marine Engines, made by the principal makers, and now working in River, Sea, and War Vessels; Locomotive Engines; together with an Appendix (B) on the Construction, the Naval Architecture, Elementary and Practical Principles of Steam Vessels, with Examples, in 20 large Plates, of Vessels now in Sea and River Service. By J. Patten, Surveyor and Naval Architect. The whole forming a work of national importance. A large thick 4to., with about 70 Plates, price 2l. 2s. Appendix (A) and (B) sold separately.

**John Wood's Architectural Library.** 60 High Colours.

Mr. Wood would be very thankful to receive Communications upon the subjects of Locomotive Steam Power, and upon Steam Navigation. Post letters will immediately be attended to.

Dedicated, by permission, to the Queen.

In 1 vol. post 8vo. price 5s. cloth.

**LONDON AS IT IS.**  
By JOHN HOGG, M.D. &c.  
A searching inquiry into all the causes that influence health, with the results, and with the means which ought to be taken for the good of the community. The volume contains a condensed view of vast materials; and the tables, in particular, are of the highest value.—*After.*

Printed for John Macrone, St. James's Square.

No. 1078.

LONDON, SATURDAY, SEPTEMBER 16, 1857.

PRICE 8d.  
Stamped Edition, 9d.

## THE BRITISH ASSOCIATION.

SEVENTH MEETING: LIVERPOOL.

As this is the seventh year of our apprenticeship to the British Association, we shall commence with Journey-work, and supply our readers with a general view of the whole; as well as with detailed Reports of those proceedings which, either from their novelty or importance, are most worthy of record. A minute notice of every thing would be a tiresome repetition of well-known facts—a discovery of *mares' nests*, which could neither edify the world of science nor inform the ordinary observer. Selection, amid the bustle and confusion of so many discussions going on at the same time, is the greatest difficulty; but even omissions would, in our opinion, be better than the indiscriminate collection of the entire heterogeneous mass, blending trifles with valuable communications, pseudo with original inventions, and the fancies of ignorance and whims of vanity with the well-founded speculations of enlightened minds and the mighty truths of comprehensive intelligence.

It is no disparagement to say, that such a mixture is inseparable from such a meeting; and that neither wisdom nor care can guard against the intrusion of a certain quantity of the useless and the foolish into the bubbling caldron of physics, chemistry, geology, statistics, mechanics, dinners, sights, soirées, and entertainments. It is well that the predominance of good is so obvious, as to render these re-unions not only delightful as regards social intercourse, but extremely serviceable in the diffusion of scientific knowledge. The localities stimulated and benefited by them, and the interchange of national courtesies with foreigners (though more limited than could be wished), are excellent features in the plan, and would alone recommend it to the success and popularity which has grown with its growth and strengthened with its age.

As we are not disposed to confine ourselves exactly within the dry rules of reporting, we hope our readers will pardon our beginning with some reflections suggested by

### THE RAILROAD.

The bridge in the Vision of Mirza is not so close a picture of human life as the transit by a railroad.

A power unseen starts the traveller on his journey, and onward he proceeds, with a fearful and unceasing rapidity. The beauties of nature are spread on his right hand and on his left, and he catches glimpses of them as he passes along; but there is no time to pluck the flower, to taste the refreshing stream, to enjoy the delicious landscape.

The magnificent palace rises on the view. He sees its colonnades and towers, and knows that grandeur is revelling there, but is hurried on, even before he can admire the fleeting pageant. On the other side stands the lowly cabin, with its laborious occupants; but they are detained no longer on the course than the splendid mansion with its listless inmates.

There is a beautiful creature on the path beside! One glance of love is interchanged, and in a few moments you are separated for

ever! The heart yearns to prolong the happiness, but it may not be: the journey is never-resting movement, never-stopping change.

Every object in turn becomes a vision, and nothing but the onward flight is a reality.

Here and there the passengers are dropped on the road—at the first station of infancy; the second, of youth; the third, mid-route: while some are borne further, to the end. How small the difference between their various journeys!

Fatigue usurps the dominion over sense; the eye tires of gazing, the ear of listening, the mind of receiving impressions; and the wish arises, that the vapour-fed and vapour-clouded peregrination were done.

Scenes of pleasure, scenes of sorrow, the distant prospect and the nearest objects, vanish, with hardly a momentary regard; and still, still you are hurried on, with increasing speed, for now all is the "declination" of art and nature.

There is a jar, a lock, a crash, which seems to dislocate the machine! A dimness creeps over the sunny world!—it grows darker and darker, and the shadows of death are upon you. The drag-chain of Fate has dragged you into the murky tunnel, and the close is the grave!

But, adieu to allegory! What has the Brummagem Railway to do with such suggestions? It is enough to have traversed the distance—ninety-seven miles in four hours; and, though about ten minutes of dark tunnelling were superadded, surely there was a resurrection into the daylight at Liverpool; and an omnibus to the Adelphi Hotel soon convinced us that we were alive and well in the breathing world: nor did a capital dinner relish the less from our having been so long in previous training. And, talking of dinners, it may be as well to mention here, that the turtle, which was *not* at Bristol last year, seems at this period to abound in its more enterprising competitor; and, we have little doubt, will afford considerable gratification to Section D, Natural History, whatever Section E (Medicine, to wit) may say to it.

On Saturday, the first business of the Association was the meeting of the General Committee, the parliament of the meetings. It was held in the handsome library of the Athenæum, which has been placed at their disposal for that purpose by the subscribers of the institution, with a promptitude which does them infinite credit; and from a member who attended, we have been favoured with the following sketch of the proceedings:—

The chair was taken at twelve o'clock by the Marquess of Northampton, acting in the absence of Lord Lansdowne, as president for the year.

The object of this meeting was, as on all former years, to arrange, by preliminary proceedings, the manner in which business was to be transacted during the week; and for this purpose, one of the two general secretaries read the intended programme, setting forth, first, the arrangements which the local committee, with the assistance and co-operation of their fellow-townsmen, had made for the accommodation of the members on their arrival at Liver-

pool; and, secondly, the order in which the proceedings of the Association would be conducted during the ensuing week.

The reading of this programme occupied considerable time, during which no observation was elicited. It was adopted, finally, by the members present, who were very numerous, amounting to nearly a hundred.

The programme was ordered to be printed, and circulated among the members of the Association, without loss of time. The Secretary then adverted to the usual Report of the Council of the Association residing in London, which was always presented at this meeting, and which, in the present instance, would be read to the members by Mr. Yates, in the name of the council. In alluding to the said report, Professor Phillips mentioned, that the council had deemed it necessary to embody in that document a number of recommendations, which, he trusted, would be adopted, as there was no doubt they would be found to be *improvements*. He left it to the honourable member, Mr. Yates, to explain and support the said recommendations; but he himself could not forbear stating, in regard to one of them, that it was absolutely necessary, and was called for by the extreme difficulty which the secretaries had hitherto experienced in transacting the many, heavy, and multifarious duties, that devolved on them at the last and concluding general meeting. On that occasion it has been customary, besides reading the reports of the sections, &c., to proceed to the consideration of all the recommendations for setting inquiries on foot, and for voting the necessary sum of money towards those inquiries, sent in by the Committee of Recommendation. As if these two great and important branches of duty had not been sufficient for the two general secretaries to attend to, a third was imposed on them, which generally gave rise to infinite discussion, and arose out of the appointment of the place of meeting for the ensuing year, and the nomination of the new president, vice-president, and secretaries, by the general committee.

The consequence of so much occupation at this general meeting was, that the thing had always been done imperfectly, or in such a hurried manner that he (Professor P.), for one, would not undertake to assert, that what he had written down in the minutes on the day in question was always correct, or to be depended upon as such. All the members of the council, who had given their mature consideration to this question, had come, like himself, to the conclusion, that a change was positively called for; as he could not, nor could any secretary, under circumstances of so much pressure, perform duties so onerous in a satisfactory manner. The change which he should recommend was, to divide the business to be transacted at the conclusion of the week of meeting, so that the appointment of the place of meeting, and the nomination of the officers, should take place on the Saturday as hitherto; but that the consideration of the recommendations for grants of money from the sections, should be deferred to the following Monday.

Professor Whewell corroborated what had fallen from Mr. Phillips, and testified to the

great attention bestowed on the question by the council, who had consequently recommended the adoption of the plan alluded to by the honourable secretary. The noble chairman, and one or two other members, seemed to concur in the plan; and the motion for its adoption was about to be put, when Dr. Granville rose and pointed out the necessity of not legislating so precipitately on a question involving so great a modification and change of the original constitution of the Association. He would only call the attention of the meeting to one striking, glaring, and, in his opinion, fatal objection to the plan proposed—that it extended the time of meeting by two days, one of which, being a Sunday, and consequently a *dies non*, could be of no service for the purpose of the Association; although, in conjunction with another day (Monday), it would prove of the utmost inconvenience to two-thirds of the members, who were either professional men, like himself, or otherwise engaged in business, and unable to absent themselves for a longer period than a week from their homes. The effect of such a measure would inevitably be that of restricting to a comparatively small portion of the members present, who could afford to remain behind for that object alone, after the real labours of the Association had terminated, and after every one else had left the place, the voting away of the money of the Society, and its application for particular requisites. These were two of the most important acts of deliberation which devolved on, and especially appertained to, the British Association. Besides, had the council reflected that there were other parties to be consulted before such a change could possibly be proposed and adopted by the members of the general committee, supposing, even, that they were prepared to pass over the formidable objection just stated? Were the council also prepared to say, that it would always be convenient to those public bodies, which liberally gave the Association the use of their rooms, threw open all their institutions, suspended their rules of restriction, and afforded often very splendid hospitality to their guests, to prolong all those acts of kindness and courtesy for two days beyond a week? And unless a certainty existed on that point, he (Dr. Granville) contended that the general committee were not in a condition to come to a resolution on the recommendation of the council, notwithstanding the emphatical defence of it by the learned secretary. For both these reasons, Dr. Granville observed that, being unwilling to meet the council by any counter resolution or amendment, which would come with an ill grace from him, he hoped that the original resolution would not be persevered in. If the business of the concluding Saturday meeting were found to be too heavy for the secretaries, why, let it be divided—let a part of it be done on a previous day.

Mr. Murchison, the other general secretary, who has succeeded the Rev. Mr. Harcourt, in consequence of that gentleman's lamented resignation on account of ill health, admitted that Dr. Granville's argument had great weight, and that the view he had therein taken had not occurred to the council, though he apprehended that it must now be entertained. He therefore suggested that the part of the business of the Saturday which related to the appointment of the place of meeting and the nomination of the officers, should take place on the Thursday, and that the recommendation for the grant of money should, as hitherto, be taken into consideration on Saturday; thus leaving things, as far as the duration of the meeting of the Association was

concerned, in the same state as before. This suggestion having been agreed to, a resolution was framed and passed to that effect.

The next recommendation of the council, read by Dr. Yates, involved likewise a change, or changes, which gave rise to considerable and lengthened discussion. It related to the qualifications which would hereafter be required of a member of the Association to become a member of the general committee. At present the rule stands—

“*General Committee.*—The general committee shall sit during the time of the meeting, or longer, to transact the business of the Association. It shall consist of all members present, who have communicated any scientific paper to a philosophical society, which paper has been printed in its transactions, or with its concurrence.”

“Members of philosophical institutions, being members of this Association, who may be sent as deputies to any meeting of the Association, shall be members of the committee for that meeting, the number being limited to two from each institution.”

This rule and the next are abrogated, and others substituted instead, some of which did not appear to meet universal approbation. The most important point of discussion, however, was the propriety of admitting, as members of the general committee, and as a matter of right—as in the case of several other scientific non-incorporated societies, which had been selected by the council, and adopted—the members of the Statistical Society of London, who had written and published papers in the transactions of that society. Professor Whewell strenuously opposed the proposition, and contended that the Statistical Society had no claim to such a privilege, inasmuch as statistics were scarcely an object of science, and that the committee might as well admit grammarians, philologists, and politicians, all of which are, by the rules of the Association, excluded from becoming *ex officio* members of the general committee. He entertained a strong opinion on the subject, and should certainly take the sense of the meeting upon the question if it were proposed.

Colonel Sykes made a few observations, tending to prove that statistics had a right to the privileges he claimed for them, and should insist on his motion, viz. that the Statistical Society of London should be added to the council-list of the favoured societies.

Another member said, that if Colonel Sykes carried his motion, he should move that the Statistical Society of Manchester should be also added.

Dr. Granville expressed his great surprise at the sentiments uttered by the learned professor of Cambridge, respecting the alleged non-scientific nature of statistics, and the absence of all claim on the part of them to be considered as a science by the Association, when their very name actually stood before him, printed in large letters, in the programme just adopted, and was to be found in the book of contributions of the Association, as part and parcel of that Society; as, in fact, constituting one of its sections. Now, if there was a section for Statistics, as there was one for Astronomy and Mathematics, and one for the Medical Sciences; and if these latter were admitted to the honour of being represented in the general committee by members taken from societies purely devoted to these branches of knowledge, he, for one (Dr. Granville), could not perceive by what operation of reasoning the learned professor came to the conclusion that statistics should, and ought, not to be so represented. It was

too late to revert, as the learned professor had done, to an old alleged fact, that the section of Statistics had got inserted by a rule usual among the other sections; that it was an illegitimate portion of the Association; that it was, in fact, what the poor-law commissioners would call a *bastardy case*. The section was there; it was fully acknowledged, and was, therefore, fully entitled to the immunities and privileges of the other sections. With regard to the argument that statistics was not strictly of the domain of sciences; that it merely bordered on that domain, but was not of it, Dr. Granville felt convinced that the learned professor would come to a different conclusion, if he would take the trouble of perusing the many valuable works that had in recent years appeared on the Continent, on “Physical and on Medical Statistics.” He agreed with the professor, that all that was purely literary or political in statistics, had no business with the purport of the Association; and he, for one, would agree to restrict the privilege of representation in the general committee to those members of the Statistical Society, either of London or of Manchester, or of both, who had published papers on “Physical Statistics” only. It was a pity, indeed, that the title of *Physical Statistics* had not been assigned to the section; for then the Association would have had it in their power to reject, most legitimately, all memoirs on moral and political statistics, such as concerned education, for instance, crime, imprisonment, &c. He hoped, therefore, that a proper concession, with a suitable distinction of grades, would be made in favour of the gallant colonel's motion.

Ultimately, Professor Whewell agreed to propose himself, that the superior office-bearers alone of the Statistical Societies of London and Manchester should be *ex-officio* members of the general committee; a motion which was seconded by Dr. Granville, and carried.

The remainder of the recommendations of the council were adopted *sub silentio, nem. dis.* The meeting then proceeded, *seriatim*, to name the president, two, and in some instances three, vice-presidents, with two secretaries, of each section; and the meeting adjourned at four o'clock.

The idea of altogether excluding literature from science is whimsical enough; but Science has always some crotchets which common-sense people cannot comprehend. According to some of these authorities, “philosophy” may consist in dissecting a nettle-leaf, or skinning a flea; but the investigations of Plato were not philosophy; nor would Plato himself have been entitled to a seat in the general committee!! These fantastic distinctions have, we regret to notice, estranged men of high intellectual powers from the Association; but we think they ought rather to disregard them, and especially if they had opportunities of observing how inconvenient any thing of a literary caste or character must be to a considerable number of associates who have no notion whatever of the matter.

On Saturday, the mayor gave a grand dinner-entertainment to many eminent persons whose arrival had been ascertained; and in the evening the fine suite of rooms were opened to the members generally, and ladies.

On Monday, the influx of strangers continued without intermission; and their reception, furnishing cards, lodgings, &c. &c., gave ample employment to the gentlemen who had undertaken these necessary duties. In the meantime, at 10 o'clock, the sectional committees met, elected their officers, and arranged the

order of business. The sections, accordingly met soon after eleven, and under the following auspices.

**Section A.—Mathematics and Physics,  
Mechanics' Institute.**

*President*—Sir David Brewster; *Vice-Presidents*—Mr. Lubbock, Mr. Baily, Mr. Peacock; *Secretaries*—Rev. Professor Powell, Professor Stevelly, Mr. W. S. Harris; *Members of Committee*—Rev. Dr. Robinson, Sir W. Hamilton, Professor Christie, Rev. W. Whewell, Professor Lloyd, Professor De la Rive, Professor Plateau, Professor Henry, Dr. Faraday, F.R.S., Professor Wheatstone, Dr. Ritchie, Major Sabine, Rev. Dr. Hincks, Mr. Russell, Professor Moll, Captain Ross, R. W. Fox, Professor McCullagh, Professor Challis.

**Section B.—Chemistry, Mechanics' Institute.**

*President*—Dr. Faraday, F.R.S.; *Vice-Presidents*—Professor Daniell, Professor Graham, Dr. Apjohn; *Secretaries*—Professor Johnston; Dr. Reynolds, Professor Miller; *Members of Committee*—Monsieur De la Rive, Dr. Thomas Thomson, M. Gay Lussac, M. Liebig, Dr. Yellowly, Professor Cumming, Mr. Richard Phillips, Mr. W. Herepath, Professor Edmund Davy, Dr. Andrews, Professor Clark, Mr. W. Lucas, Mr. H. H. Watson, Dr. Kane, Mr. Mackintosh, Dr. R. D. Thomson, Mr. Thomas Thomson, jun., Mr. Charles Tennant, Mr. Crossall, Mr. Robert Mallett, Mr. Walter Crum, Dr. Ingles.

**Section C.—Geology and Geography,  
Mechanics' Institute.**

*President*—Rev. Professor Sedgwick (for Geography, G. B. Greenough); *Vice-Presidents*—Leonard Horner, Lord Cole, M.P., H. T. De la Beche, F.R.S.; *Secretaries*—Capt. Portlock, B. Huxton, M.P. (for Geography, Capt. H. M. Seaham, R.N.); *Members of Committee*—James Bryce, Sir Philip Egreton, W. J. Henwood, James M'Adam, Major Sabine, H. E. Strickland, W. West, M.D., H. K. Clarke, Richard Griffith, B. Ibbotson, Col. Silvertop, R. J. Murchison, T. S. Traill, M.D., Rev. James Yates, Professor Phillips, Major Shadwell, Chester.

**Section D.—Natural History,  
Royal Institution.**

*President*—W. Sharpe Macleay, F.L.S.; *Vice-Presidents*—Dr. Richardson, Professor Graham, Professor Lindley; *Secretaries*—C. C. Babington, F.L.S., W. Swainson, F.L.S., Rev. L. Jenyns, F.L.S.; *Members of Committee*—Thomas Hinks, D.D., N. A. Vigors, F.L.S., Rev. F. W. Hope, F.L.S., Pat. Neill, L.L.D., Professor J. S. Henslow, T. S. Traill, M.D., Earl of Derby, Rev. W. Hinks, F.L.S., John Curtis, F.L.S., P. B. Duncan, F.L.S., J. E. Gray, F.R.S., Charles S. Parker, Rev. J. Yates, J. E. Bowman, T. Eytton, J. P. Selby, C. Horsfall, R. Ball, S. W. Dillwyn, J. N. Walker, A. H. Halliday, J. T. Mackay, Captain James Ross, Sir W. Jardine, R. Harrison, Mr. Thunsey, H. Sandbach, J. Salisbury, Mr. Green, Dr. Duncan, F. Archer, G. Cook.

**Section E.—Medical Science.**

*President*—Professor William Clark, M.D.; *Vice-Presidents*—J. Carson, M.D. F.R.S., P. M. Roget, M.D. Sec. F.R.S., R. Bickersteth, Esq., Professor R. T. Evanson, M.D. M.R.L.A.; *Secretaries*—J. Carson, jun. M.D., J. H. W. Voss, M.D.; *Members of Committee*—Neill Arnott, M.D. F.R.S., R. Bright, M.D. F.R.S., Hugh Carlisle, M.D. J. Copland, M.D. F.R.S., Professor R. T. Evanson, M.D. M.R.L.A., Richard Forby, M.D., Augustus B. Granville, M.D. F.R.S., John Houston, M.D. M.R.L.A., James Johnson, M.D., James Macarney, M.D. F.R.S., Charles Herbert Orpen, M.D., William Henry Porter, Esq., Charles B. Williams, M.D. F.R.S., John Yelloly, M.D. F.R.S.

**Section F.—Statistics, Savings' Bank.**

*President*—Lord Sandes, M.P.; *Vice-Presidents*—Col. Sykes, Mr. G. R. Porter, Mr. J. Heywood; *Secretaries*—Mr. W. R. Greg, Dr. W. C. Taylor, Mr. W. Langton; *Members of Committee*—Dr. Jerrard, Mr. Howden, Mr. Frapp, Dr. Carpenter, Mr. H. Romilly, Col. Briggs, Mr. Corrie, W. C. Taylor, L.L.D., W. Wyse, M.P., Mr. Laney, M.P., Mr. Urquhart, Dr. Kay, Mr. Tuffnell, Mr. Chadwick, Mr. S. J. Loyd, Mr. Simpson.

**Section G.—Mechanics, Mechanics' Institute.**

*President*—Rev. T. R. Robinson, D.D. F.R.S.; *Vice-Presidents*—Dionysius Lardner, L.L.D. F.R.S., Professor Wheatstone, London, Professor Willis, Cambridge; *Secretaries*—William Ritchie Vignoles, C.E.; *Members of Committee*—John Scott Russell, F.R.S.E., John Taylor, F.R.S., John Robinson, F.R.S.E., Davies Gilbert, F.R.S., Dr. Traill, F.R.S.E., Geo. Rennie, F.R.S., Rev. John Blackburne, Pres. Sheffield Phil. Soc.; *Associates*—John Isaac Hawkins, C.E., William Fairbairn, Peter Clare, Geo. Forrester, Edmund Barry, William Fawcett, Henry Booth, Hardman Earle, Joseph Locke, David Hodgson.

Thus constituted, the various sections proceeded to hold their sittings; and though an exceedingly wet forenoon threw somewhat of a damp over the locomotive, the arrangements were all in such good order, that even the usual confusion of beginning operations so various and complicated, was entirely avoided.

The Mechanics' Institute had been rapidly restored from the effects of the recent disastrous fire, and excellent accommodations (though the numbers appear to form a bustle in the lobbies) made for the four Sections located under its roof; as well as for rooms where the ordinary tickets were issued, and other useful purposes connected with the assembly. The other three Sections were also very conveniently lodged within very short distances from these head quarters.

The Geological and Natural History Sections had galleries for ladies; and both were graced by the beauty of Liverpool, with its Lancashire witches, and of the strangers who were now their visitors.

In our report for the present week, we must, to a certain extent, be guided by circumstances; for, if possible, it would be unadvisable to go on with a regular series of the papers and discussions. We shall select such as are most suitable for local and popular purposes—such as can be most clearly explained—and reserve others for the very brief notices which their nature demands, or the more perfect illustration which time may enable us to supply.

Section A commenced with a paper by Professor Powell, on the dispersion of light, in which he stated the results obtained from an examination of different highly refractive media, and the concurrence of these results with the theory of Mr. Kelland.

After which was read a paper by Col. Gold, on the possibility of establishing regular telegraphic communications by night and day. It touched upon the practicability of communicating by sounds; which mode was objectionable on account of the alarm to which it might give rise. Communications by means of projectiles were liable to still more serious objections. The most eligible mode which suggested itself was that of intercommunication by means of electricity. Several calculations were entered into; but we fear that they were only suggested by the writer's not being aware of old and much more extensive experiments having led to certain results of far greater application.

Mr. Cunningham sent a communication on the construction of magnets. It recommended the formation by casting of the magnets into the ordinary horse-shoe form, previously to their being converted into steel. Mr. Christie suggested that such communications as the one just read should contain some numerical results on the subject. The importance of the present subject rendered this the more imperative, inasmuch as government was now making inquiries as to the best material for the construction of magnetic needles. Mr. Holden observed, that, in his experience, the best refined steel took the most strongly the magnetic power, and retained it longest. The chairman observed, that drawn steel-wire, in his opinion, took most strongly and permanently the magnetic influence. Another gentleman informed the company that he had actually found by experiment, that cast iron did not retain its magnetic influence as long as steel.

Mr. Lubbock proceeded to give an account of the manner in which the money placed at his disposal, for the purpose of making observations on the tides, had been expended, and to detail the results which were obtained. It appeared, that the fluctuations in the tides were not entirely owing to the barometrical variations, though these, with other accidental circumstances, must necessarily produce some disturbance. In every case, the results obtained were carefully compared with the theo-

ries which have recently obtained popular credit. Various calculations were entered into to illustrate the theory which Mr. Lubbock had adopted, the formulae of which would require half a volume of philosophical transactions to lay down and explain. The observations made corresponded very exactly with the theory of Bernoulli, the actual results coinciding with a degree of exactness approximating to absolute identity. The curves exhibited on the diagrams which were produced before the meeting, in very few cases showed any considerable variations; and those between the observations made during the year at Liverpool and London, though accompanied by phenomena not yet accounted for, also coincided nearly in other respects. Mr. Lubbock spoke in terms of high commendation of the accuracy with which Mr. Russell had conducted the experiments at Liverpool, and had discussed the observations of 19 years at the London Docks. The variation between Liverpool and London for the moon's parallax amounted (as we understood him) to about four minutes; and this was so certain, from the vast number of observations made, that the cause was well deserving of inquiry.

The diagrams exhibited fully demonstrated the report; and we have only to regret that a subject of such vast interest cannot be even faintly explained in a popular manner. The main conclusion is, making allowances for the casual disturbances of atmospheric pressure in the experiments, that Bernoulli's equilibrium theory nearly satisfies the phenomena in every respect. Mr. Lubbock concluded by alluding to the irregularities produced by atmospheric pressure on the height of the tides, which rendered it necessary to consider the barometrical indications, in making any calculations from the average of observations.

Mr. Whewell made several remarks in corroboration of the theory of Mr. Lubbock, and likewise several interesting observations on the singular phenomena exhibited in the progress of the diurnal tide-wave on the coasts and in the rivers of England.

A member dwelt on the utility of devoting the funds of the Association for the purpose of collecting such a mass of information as that furnished to Mr. Lubbock, and on the advantage of co-operation in carrying on such investigations.

Professor Staveley said, that the captain of the vessel in which he came from Ireland observed that the diurnal wave was frequently augmented by the reflux of the semi-diurnal wave; and, in some instances, the effect produced was so considerable, as to cause a difference of several feet in the height of the tide, in places within a very short distance of each other.

Professor Christie noticed, that in several of the ports on the coast of England there were actually two high waters, produced, it was suggested, by the arrival of a tidal wave from two different directions. The instances of Southampton and Poole were mentioned, in the former of which there are two periods of high water at each tide, within an interval of an hour and a half; and, in the latter case, the same phenomena take place within an interval of three hours.

The Chairman suggested that the phenomena might be accounted for by supposing the ebb tide to be arrested by the influx of the flood tide, and thus augment the tidal wave.

Mr. Whewell next proceeded to read a communication on the subject of his anemometer, exhibited at two preceding meetings. His

object in bringing the subject before the Section at present was to shew the results of the observations made with it at Cambridge, and elsewhere. Mr. Whewell also alluded to another instrument, constructed by Mr. Osler, which had been constructed for determining the whole course of the wind, and its intensity at any particular moment.

Mr. Osler proceeded to describe the instrument constructed by him, and to detail the results obtained during the last year. This instrument also shewed the quantity of rain which fell during the same period, and the length of time which it occupied in falling. It also shewed the state of the thermometer; thus giving a comparative view of all the changes which take place in the atmosphere.

Mr. Whewell complimented Mr. Osler on the perfection of the instrument constructed by him, especially as a registering instrument of all the atmospherical phenomena.

Section B. In this Section, little was done; and the committee did not seem to be prepared with papers to last above an hour.

Professor Johnston opened the proceedings, by stating that it was customary, in the first place, for those individuals who had undertaken researches at the suggestion of the Association, to communicate the result of their labours during the past year. Owing, however, to the lamented death of Dr. Henry, the serious indisposition of Dr. Dalton, as well as the absence of Mr. Faraday, to whom these duties had been confided, no additional information was obtained.

Mr. Crane, of Yriscledwyn Iron-works, near Swansea, read a paper on his successful introduction of anthracite coal, by the combination of heated air, to the purpose of smelting iron ore. The reduction of the quantity of fuel expended to less than a third of that before required of the bituminous kinds for the production of the ton of pig-iron—the increase of from 40 to 50 per cent upon the former make by the process—and the greatly increased strength of the metal, when compared with that previously obtained by him from the native ores of the South Welsh basin, with the use of the coke of the bituminous veins and cold blast, were the leading points of the paper. This is a subject of great interest in a commercial point of view, as, if perfectly successful—and, from the experiments of Mr. Crane, on a large scale (noticed in a former *Literary Gazette*), there seems to be strong grounds for supposing it may be so—it is a question whether the discovery will prove more beneficial or injurious to the prosperity of this country. On the one hand, it was urged by Mr. Crane, that at least one-third of the immense coal-field of South Wales is composed of anthracite coal, which will thus, for the first time, be brought into extensive use for the purposes of smelting; but, on the other hand, it must be remembered that this description of coal exists, together with iron ore, in great abundance in the United States of America,\* as well as in various parts of the Continent, the inhabitants of which would, if the theory hold good, be enabled to rival our works at a cheap rate. Mr. Crane stated that he had smelted a ton of iron, on an average, with less than 27 cwt. of anthracite coal; and, in regard to quality, the result was perfectly satisfactory. His works had long been noted for producing iron, equal, if not superior, to others in South Wales; and, by means of an-

thracite coal, he had been able to improve its quality. Anthracite coal being almost entirely composed of carbon, it was his opinion that he would be able, at no distant period, to produce, by its means, an iron not inferior to that formerly smelted by charcoal. Having beds of bituminous coal, as well as anthracite, in his possession, he had instituted comparisons as to the amount of iron which could be produced by the most economical application of each, and he found that there was a very considerable saving in the use of the latter. Mr. Crane then gave a highly descriptive account of the manner in which he had first discovered the means of applying his discovery to the combustion of the coal. The mode in which he now conducted the smelting was by means of a cupola furnace, into which he urged a stream of air, heated to such a degree as to be able to melt lead; the effect of this hot blast being all that was necessary to produce that combustion of the coal requisite for the reduction of the ore.

Dr. Kane proceeded to explain the nature of pyroacetic spirit. If acetate of barytes be exposed to a certain temperature, there will remain in the vessel containing it carbonate of barytes; whilst a peculiar fluid, somewhat resembling alcohol, is separated. This fluid has been long known by the name of pyroacetic spirit. Its composition and properties have been examined by many chemists, several of whom have noticed its power of combining with other bodies. In order to understand the alteration which it undergoes, we must take its formation, and consider it as being C 6, H 6, 62. He conceived that pyroacetic spirit was constituted very similarly to alcohol. At present, there are two alcoholic compounds known—the common wine alcohol, and the common pyroacetic spirit. Dr. Kane then described the various combinations which the spirit enters into with acids and other substances, illustrating the whole by means of diagrams, shewing the atomic proportions of each simple element.

A paper of Mr. Golding Bird, on the crystallisation of metals by voltaic agency, was then read.

In the Chemical Section, the following paper by Mr. Black (whose work on *Brewing*, &c. has received our warm praise) was read; and it is one of those so generally and practically useful, as well as new and ingenious, that we go out of our routine to insert, in our first No. of these reports, the *Observations on the injurious influence which Electricity exerts in Brewing and Distilling*.

I trust (says Mr. Black) I may be excused in drawing the attention of the meeting of the British Association to a short notice of the injurious influence which electricity exerts on the fermentation of the worts of the brewer and the wash of the distiller. The powerful and injurious effects produced by this agent in the manufacture of beer, I endeavoured to point out in a little work, lately published, on *Brewing*; which, although it has excited some notice among a few practical men, yet the subject has not received that due attention which its great importance deserves. But I entertain a hope, that this matter will stimulate some members of the Association minutely to examine the nature and extent of the electrical agency, and, by well-devised experiments (towards which, if required, I should most willingly give any information or assistance), succeed in convincing brewers and distillers of the necessity of studying the laws which regulate this all-powerful agent, in order that they may avoid its injurious effects in the manufacture of beer or spirits. Beer, to the industrious

classes in this country, may be considered a necessary of life; and its wholesomeness and purity must, therefore, be of vital importance. The quality varies exceedingly in different parts of the kingdom, and what is considered good beer in one district, may in other parts be pronounced *excellent*. One great cause of the inferiority of beer and ales in the country, and the great diversity of flavour, arises from the want of competition; it being only in the large towns that strong competition exists. In the country districts there is little or none. The brewers have been long in the habit of purchasing up all the public-houses in their neighbourhood, and these houses being limited in number, the labouring classes are prevented from selecting their own beverage, and have no choice but to drink that of the proprietors of the public-houses, and who are also the brewers. Most of such beers are very imperfectly manufactured, and are usually foul and yeast-bitten, and have a very disagreeable, rank bitter, derived from the yeast left in the beer, instead of its being thrown out by a proper process. This bitter, although often mistaken for, is very different from, the agreeable and aromatic flavour of the hop. Yeast-bitten beer is particularly injurious to wet-nurses in the suckling of infants. In some districts, unsound, stale beer, is the favourite beverage; so that, from long usage, good, sound beer, would not be appreciated, but rejected. A frequent cause of such inferior beers proceeds from want of proper attention being paid to cleanliness, and the soundness of the worts, accompanied with imperfect fermentation. I suspect, however, that it very often proceeds from electric or galvanic agency; the fermenting vessels being very frequently sunk in the ground, are particularly liable to be affected by all electrical and atmospherical changes, as I have had many opportunities of observing. It is to the latter that I wish to direct the attention of the meeting. It has long been familiarly known, that thunder sours beer; but, though generally known, but few brewers have inquired into the cause, or adopted means to prevent this atmospheric, or other action, affecting beer during thunder-storms, or in the different electric states of the earth and atmosphere. The extreme rapidity with which the electricity is evolved during a thunder-storm, is strikingly exhibited in a distiller's fermenting back. These fermenting backs are often made of cast-iron, and either fixed in the earth, or connected with it by an intermediate iron vessel, employed in regulating the temperature. A very short time after a thunder-storm begins, or when the atmosphere is highly charged with electric matter, the appearance in the back altogether changes. The usual healthy appearance of the fermentation disappears; and it is now attended with a hissing noise and frothy head: and when samples are drawn and examined, is found to have risen, instead of fallen, in gravity many degrees, and to contain 5 per cent, or more, of acid. Under these circumstances, the distiller has no alternative but to run off his wash into the stills, although they may be as high as 10 or 12 degrees above water, or occasionally of much higher gravity.

But the chemical agency a highly electrical state of the atmosphere possesses is not confined solely to the fermentation of vegetable substances; it affects even the smelting of iron. It is well known to iron-masters and smelters, that in certain conditions of the atmosphere, and particularly during sultry summer weather, that they can never with certainty calculate upon producing good, soft, tenacious iron,

\* The American journals, in their usual jocular manner, settled this question in another way. "It has been found," said the editor, "that anthracite agrees with coal in all its elements, its carbon, its nitrogen, &c. &c. The only difference is, that coal will burn, and anthracite won't."

technically called No. 1: it is much more generally the white, hard, inferior kind, called No. 3, or a mixture of Nos. 2 and 3. Now, in such circumstances, it will be found that the iron was melted during a thunder-storm, or when the air was highly charged with electricity. In these cases the ore shall be of the best quality, and all the other manipulations attending the melting carefully looked after, and even a much greater charge of coke be employed (the *dernier resort* of the melter), when apprehensive of hard, inferior iron, yet, notwithstanding all these precautions, the yield of iron is of the No. 3 quality. The operating cause we attribute to electricity. The result of my observations, in different parts of the kingdom (and they have been pretty widely extended), is, that where the fermenting tuns have been placed upon baked wooden bearers, and supported upon brick or wooden piers, or columns, and every other precaution used to insulate the vessels as much as possible, the fermentations proceed regularly and progressively, and the beers turn out good, bright, and sound, and will keep so; but that when placed on, or imbedded in the earth, and when electric action is induced by a chain of copper or metal pipes, making a complete galvanic circle, the fermentations are very irregular, and do not go through their changes in any thing like order, and shewing only extremely high, light, puffy heads. Frequently the attenuation or decrease of specific gravity altogether stops; and the beer becomes sour, or partially unsound, before leaving the fermenting tun. A rather singular attendant on this galvanic action in the fermentation is, that the temperature of the worts in the fermenting tun will rise, in the course of one night, 10 or 12 degrees, or more, and without a corresponding attenuation; while, in all healthy fermentations, there is a regular and proportional decrease of gravity for increase of temperature. This is a point (although at present very little known or attended to) of the utmost consequence in regulating the proper quantities of yeast to be employed as a ferment, according to the specific gravity of the worts, and quality of the beer to be produced. A great deal of attention has of late years been bestowed on the mechanical construction of the utensils employed in breweries, in order to diminish manual labour and waste of beer, and in making them quite *automatic*. In these improvements, unfortunately, too little attention has been paid to the injurious action of galvanism, or electricity. We know of one exception. An extensive establishment in London, well aware of the action induced by electricity, took the wise precaution, a few years since, when erecting fermenting tuns, containing 1400 barrels each, and supported by iron columns, to have them insulated, from which they have derived great benefit. The same house, sensible of the importance of observing the atmospheric changes, has kept a meteorological journal for the last ten years; the observations being made three times a day, at four o'clock, A.M., at nine o'clock, A.M., and at three o'clock, P.M. In order to prevent the electric action in the fermentations of beer or wash, the vessels should be thoroughly insulated, and the mains, or pipes, leading to or from these vessels, should be thoroughly disconnected from them, by means of unions, screws, or perhaps still better, by a short hose of leather, or caoutchouc, or Indian rubber. By these simple means, the galvanic circle otherwise formed by the metal pipes and cocks, &c. employed in removing the worts, refrigerating, or cleansing, will be broken, and a uni-

form, regular, and healthy fermentation be produced. I have often been inclined to think, that the great difference in the quality of wines we read of, produced from vineyards within a short distance of each other, may as often be traced to some electrical action, caused by a bad arrangement of the fermenting vessels, as to any difference in the soil or quality of the grapes. I hope these few observations, brief as they may be, will draw the attention of men of science, and also of the manufacturer, to the subject, believing it one of primary importance in this branch of the chemical arts.

Mr. Faraday and Dr. T. Thomson highly complimented Mr. Black on the suggestions in this paper; and considered them particularly worthy of the attention of brewers and distillers.

Section C.—In the following we have also anticipated our daily report, on account of the great interest of the subject.

*Major Sabine's Report on the Variations in the Intensity of Terrestrial Magnetism at different parts of the Earth's surface.*—This report was to have been printed in the last year's volume of the Reports of the British Association. The author explained that the delay had been occasioned by the influx of new and very valuable materials, with which he had been unexpectedly furnished when engaged in completing the report. Amongst these, he specified a series of observations made by Captain Fitzroy, and the officers of H. M. S. Beagle, during her five years' voyage of survey and circumnavigation, by which the value of the terrestrial intensity had been determined at between thirty and forty widely scattered stations, principally in the southern hemisphere, where such determination had been previously a great desideratum. The deduction of the results of these and other observations, which were put into the author's hands in the state in which they were made, was a work of much time and labour; but he considers their accession to the report an increase of its value, which far more than counterbalances the inconvenience of the delays. The report is now complete. Major Sabine stated that his object in this report had been to collect and present, in a condensed and arranged form, the results of all the observations on this subject which have been made, by observers of all nations, from the close of the last century, when these researches commenced, to the present time. The greater part of these existed previously, dispersed in the transactions of scientific societies, and in scientific journals, chiefly in the German language, and very rarely to be met with in this country. The number of separate determinations collected in this report exceeds 600; and the number of different stations distributed over the earth's surface, at which the terrestrial intensity has been observed, falls a little short of 600. The observers are twenty-one in number, of which the observations of seven are previously unpublished. The author gave some short details of the arrangement of the tables in which the results are comprised; and of the manner in which the values of the intensity are expressed; also on the degree of accord in the results of different observers who have visited the same station, from chance, some estimate may be formed of the degree of accuracy of each single determination. The report is accompanied by maps, in which the several determinations are also entered, and the lines of equal magnetic intensity traced, for the purpose of enabling a more ready apprehension of the systematic distribution of the intensity on the earth's surface, which the facts now collected establish. Major

Sabine discusses the general inferences with regard to the distribution of the intensity, which are pointed out by the concurrent and consistent testimony of so large a body of results; and concludes by pointing out the parts of the earth where further observations are most desirable, and noticing the practical suggestions, in regard to instruments, and the methods of observation, which are either expressly mentioned, or may be gathered from the experience of the observers whose observations he has discussed.

Section D.—Dr. Traill exhibited and gave a brief notice of the *Argus Persicus*, or the Poisonous Bug of Minnaeh, in Persia. The specimen which the learned doctor produced had been procured from Persia by a friend of his, who favoured him with a short statement relative to the nature of the insect. The bite of it was exceedingly dangerous, producing a violent fever, resembling our typhus fever, and, in many instances, occasioning death. In some villages it was considered almost certain death to sleep.

Mr. J. E. Gray brought forward the new genus, allied to the water-lily, and called *Victoria Regina*, which was discovered by Mr. R. H. Schomburgk, last January, in the river Berbice. At the meeting of the Botanical Society, last Thursday, the following letter (which has appeared in all the London newspapers) was read from him, dated New Amsterdam, Berbice, May 11th, 1837, on a new genus allied to the water-lily, named *Victoria Regina*, by permission of her majesty. The communication was accompanied by magnificent drawings of the plant, one half the natural size. The following account is extracted from Mr. Schomburgk's paper:—"It was on the 1st of January this year, while contending with the difficulties nature opposed in different forms to our progress up the River Berbice (in British Guiana), that we arrived at a point where the river expanded and formed a currentless basin. Some object on the southern extremity of this basin attracted my attention; it was impossible to form any idea what it could be, and animating the crew to increase the rate of paddling, shortly afterwards we were opposite the object which had raised my curiosity. A vegetable wonder! All calamities were forgotten; I felt as a botanist, and felt myself rewarded; a gigantic leaf, from five to six feet in diameter, salver-shaped, with a broad rim, of a light green above, and a vivid crimson below, resting upon the water. Quite in character with the wonderful leaf was the luxuriant flower, consisting of many hundred petals, passing in alternate tints from pure white to rose and pink. The smooth water was covered with them, and I rowed from one to another, and observed always something new to admire. The leaf, on its surface, is of a bright green; in form orbiculate, with this exception—opposite its axis, where it is slightly bent in, its diameter measured from five to six feet. Around the margin extended a rim, about three to five inches high; on the inside light green, like the surface of the leaf; on the outside, like the leaf's lower part, of a bright crimson. The stem of the flower is an inch thick near the calyx, and is studded with sharp elastic prickles about three quarters of an inch in length. The calyx is four-leaved, each upwards of seven inches in length, and three in breadth at the base; they are thick white inside, reddish brown and prickly outside. The diameter of the calyx is twelve to thirteen inches; on it rests the magnificent flower, which, when fully developed, covers completely the calyx with its

hundred petals. When it first opens, it is white with pink in the middle, which spreads over the whole flower the more it advances in age, and it is generally found the next day of a pink colour. As if to enhance its beauty, it is sweet scented. Like others of its tribe, it possesses a fleshy disc, and petals and stamens pass gradually into each other, and many petaloid leaves may be observed, which have vestiges of an anther. We met them afterwards frequently; and the higher we advanced the more gigantic they became. We measured a leaf which was six feet five inches in diameter; its rim five and a half inches high, and the flower across fifteen inches. The flower is much injured by a beetle, *Thrinacia* species, which destroys completely the inner part. We have counted from twenty to thirty in one flower.\* A fine drawing of the plant was hung behind the chair.

A discussion of much interest ensued on Mr. Cross's experiments, in which that gentleman had supposed the existence of certain insects in flints. Mr. Gray informed the meeting of the results of Mr. Children's repetition of Mr. Cross's experiment on the reproduction of insects from the solution of silicia, and that they did not confirm the opinions of Mr. Cross. On the contrary, Mr. C. shews that the insects found are such as occur in the dust of rooms; and had no doubt but that accident had led to their appearance amidst Mr. Cross's apparatus.\* It was suggested, however, that eggs might exist. A very animated discussion took place on the subject.

The Rev. T. W. Hope read a communication from Sir Thomas Phillips, on the best method of destroying the insects which attack books and manuscripts.

The last paper presented was one by Mr. Ball, on *Erica Machaina*, with an exhibition of living specimens.

Section E.—In this section two papers of considerable importance were communicated. First, Dr. Williams, of London, read a second report of the London sub-committee of the British Association, to investigate the motions and sounds of the heart. With regard to the abnormal sounds of the heart, the first, or systolic sound of the heart was caused by the sudden tightening of the ventricles as they acted. The fifth class of experiments, relating to the production of sound, had been tried by means of a caoutchouc tube, fastened into a stop-cock at the bottom of a cistern, and by means of this they had been enabled to produce all the sounds heard by the medium of the stethoscope in the heart. When the water was permitted to flow, so as to distend the India-rubber tube, and the atmosphere had been completely expelled from it, a slight indenting pressure in the tube, produced the murmuring sound so often heard, which was increased in volume by increasing the force of the water. By inserting a pin through the tube, the whistling noise often heard was produced, and by sticking a broader piece of quill through, it produced the blowing noise. By these means, by variety of pressure, and by tightening a ligature round the tube, and causing angular obstructions in it, all the sounds of whizzing, grasping, blowing, murmuring, purring, and cooing, heard in the heart and arteries, by means of the stethoscope could be distinctly heard. When the walls of the tube became flaccid, a fremitus sound was

caused. From all these results it was sufficient to say, a certain obstruction in the physical was the cause of all the murmurs or sounds in the tube. The sounds produced by water in the tube by obstructions, were so similar to those produced in tubes by air, that it might be imagined the same cause produced the one as the other. Dr. Williams then proceeded to detail several experiments in the production of murmurs in the arteries of the living body. About two inches of the carotid artery of a dog was laid bare, and different degrees of pressure upon it produced the different murmurs of blowing, whizzing, &c. heard through the medium of the stethoscope in the arteries and in the heart. The artery was then made to contract by slightly scraping it with a scalpel, and applying salt to the part. This produced a gradual constriction, but the stethoscope detected no murmur. A small pressure, however, immediately caused a murmur. Near the constriction the pulse was harder and sharper than above or below. It was then found that a murmur could be produced by pressure on the sub-clavian, carotid, or femoral arteries, in the human subject, which might be heard through a stethoscope, which was sometimes like the singing of a kettle, or the cooing of a dove, &c. The carotid of the dog was afterwards slightly punctured, and a jet of blood followed about six yards high, which, in a few minutes, caused the death of the dog by hemorrhage. After respiration had ceased, it was found that the heart continued to beat for about two minutes. It was proved that the murmuring might be produced in a healthy subject, by moderate pressure on a principal artery, and that, therefore, this sound did not indicate disease in the artery. Accidental pressure, it was found, would also produce what the French have termed the *bruit de diable*.

A long discussion ensued between Drs. Copeland, Grinfield, Johnson, and others. The heart was said to be the *ultimo moriens*; would continue its action though no blood was there; that respiration first ceased its action, then the brain, and lastly the heart, a fact which Dr. Grinfield had verified from experiment by poison, chiefly prussic acid. After the lungs had discontinued breathing, he found the heart beating, and the bowels proceeding with their peristaltic action simultaneously. Dr. Johnson differed from the report, which would seem to prove that all sounds of the heart and arteries were symptomatic of disease. This was erroneous; for, on himself and others, he found, by excitement, and after taking food, he could distinguish some sounds, though he and others were healthy; and would therefore recommend that increased motion from excitement should be more particularly examined; but Dr. Williams stated that it was found that various velocities in perfect irregular tubes did not create sound, and would recommend medical gentlemen not to try experiments upon themselves. It was concluded that Dr. Williams should repeat the experiment in the laboratory of the Medical Institution, at ten o'clock to-morrow morning (this day).

Second, Mr. Brett, surgeon, now read a most elaborate paper, replete with novelty and ingenuity, on the chemistry of expectorated matters, and their diagnostic relations with diseases of the lungs, especially consumption. After enumerating the state of albumen in blood, he proceeded to shew the composition of spitte and the sputa from the lungs. The latter kind of matter varied in its physical and chemical qualities according to the stage of the disease and its nature. In the latter stage, when consump-

tion was established, globules existed shewn by the microscope, and chemistry detected much albumen, and even iron. Analysis also found the matter of broken down tubercles was the same as pus, and that perfect puriform matter consisted of water, albumen, animal matter, soluble in spirit of wine, as fat, osmazone, &c.; animal matter, soluble in water; salts, chiefly chlorates, phosphates, sulphates, &c.; soda. In the last stage, oxide of iron. The paper contained many tables, fully bearing out the writer's propositions; and it underwent a long examination by Mr. Bird, the President, Drs. Roget, Williams, Johnson, &c.

Section F.—A paper of importance, viz. a statement of the British trade with America during a long series of years, by Mr. Porter, was read. "In this place, and especially at the present time, it cannot be necessary to offer an apology to the Statistical Section of the British Association, for presenting to its notice a brief record of the growth, progress, and present extent of the trade carried on between the United Kingdom and that portion of the New World which now constitutes the United States of America. There is, however, some necessity for bespeaking the indulgence of the Section towards the execution of an attempt, which is necessarily incomplete, because the commercial records relating to the earlier periods of our history are exceedingly scanty, and, besides, are too frequently without the stamp of authenticity; so that their value is to be estimated rather from their agreement with other known facts, than from any confidence we should otherwise place in the records themselves. Until comparatively a very recent period, the importance of statistical labours was not understood in this country. It was not seen in what manner, nor in how great a degree, the knowledge of facts applying to former years, and systematically arranged, could assist the legislature and public functionaries in conducting the business of government, and providing for the prosperity of future years. This indifference to what is now recognised as a work of high necessity, was formerly not confined to commercial details. It might, perhaps, be thought that the record of those details would be best preserved by commercial men, who were most interested in the subject; but the deficiency of which we now complain was exhibited in a matter of much more obvious importance to the government and the nation at large, namely, the financial accounts of the country. In these days of watchfulness and severe scrutiny into every branch of the public expenditure, it will hardly be credited that there is not a trace to be found in the Journals of the House of Commons of any account of the produce of the taxes having been called for by parliament during the whole course of the American war,—a fact attested by the late Mr. George Rose, who, having been for many years a cabinet minister, knew well the importance of such returns. As might naturally be expected, the carelessness thus evinced by the members of the legislature was not confined to them, but was shewn also by the public accountants. In the published report of the Finance Committee, which sat in 1782, it is stated that 'the committee thought it right to call for an account of the net produce of all the taxes from 1774 to 1782, distinguishing each year; but as that account consisted of more than one hundred and fifty items, put together in a confused manner, not totalled by the officer of the exchequer, the result could not be stated.' Of late years we have begun to do that for our successors, which it is so much to be wished our predecessors had done

\* On further inquiry, we are told that the insect described in Mr. Children's experiments is an *Acarus*; and that, as it was not exhibited, some gentlemen only supposed that it was the common *acarus*.

for us. The body of facts now systematically collected in this country at the period of their actual occurrence, and attested by the signatures of public functionaries, whose fidelity and accuracy cannot be doubted, are every day becoming more and more valuable through their accumulation; and will at length provide so steady and so bright a light, by which to read the pages of economical science, that it will be hardly possible to misinterpret the lessons they convey. Happily, too, the collection of statistical data is not confined to our own country; so that by this means we shall not only obtain records of various classes of facts which belong to dissimilar climates, and which are called forth by different circumstances, but we shall also be able to judge of the manner and degree in which the same facts and measures are capable of being modified by the force of circumstances,—a kind of knowledge calculated to exercise a powerful and most beneficial influence upon the welfare and happiness of mankind. Those persons only, who have given their attention to the collection of statistical information, can form an adequate idea of the advantage that may at some time or other be drawn from the record of even an insulated and apparently an unimportant fact, which may throw light upon matters, and render them pregnant with instruction, which, without this help, would have continued unintelligible, if even they should not be misunderstood, and thence perverted to mischievous ends. It is this conviction which emboldens me to offer to the Section the following imperfect sketch: the facts which it embodies, few and insufficient as they may be considered, are drawn from sources, some of which are not generally accessible, and are fast passing into oblivion. The British colonies, which now form part of the United States of America, were, with the exception of Georgia, all founded in the seventeenth century. The date of the first settlement of each individual colony was as follows:

Virginia .....	1607	Maryland .....	1633
New York .....	1614	Connecticut .....	1635
Massachusetts .....	1620	Rhode Island .....	1636
New Hampshire .....	1623	North Carolina .....	1650
New Jersey .....	1624	South Carolina .....	1670
Delaware .....	1627	Pennsylvania .....	1682
Maine .....	1630	Georgia .....	1733

The earliest of these settlements resulted from the persecutions on account of religious opinions then prevalent in England, and had no view to the extension of our commerce. The success of the colonists, however, naturally gave rise to a brisk commercial intercourse with the mother country; and we are told by Sir Joshua Childs, in his 'New Discourse of Trade,' published about 1670, that at that time 'the trade to our American plantations employed nearly two-thirds of all our English shipping, and thereby gave constant sustenance to, it may be, 200,000 persons here at home.' It is most probable that the West India colonies were included in this estimate, because, thirty years later, the whole imports and exports from and to the North American provinces did not amount to 700,000*l*. In a work entitled, 'The Trade and Navigation of England Considered,' first published in 1728, by Joshua Gee, we find the following notice of the trade of those provinces:—'The tobacco plantations take from England their clothing, household goods, and utensils of all kinds; and England takes from them tobacco, for use and for re-exportation. Carolina lies in a happy climate, producing the best rice in the world. Pennsylvania, within forty years, has made wonderful improvements, which have very much enlarged their demands upon us for broad-cloths, druggets, serges, stuffs, and

manufactures of all sorts. They supply the sugar plantations with lumber, pipe-staves, &c.' A tract was published in London, in 1731, under the title of 'The Importance of the British Plantations in America to this Kingdom;' and in this tract it is stated that Virginia and Maryland together then sent annually to Great Britain 60,000 hogsheads of tobacco, each weighing 600 lbs., which, at 2*d*. per lb., amounted to 375,000*l*.: that the shipping employed to bring home this tobacco, amounted to 24,000 tons; the freight, at 30*s*. per hogshead, was 90,000*l*.; other charges, and commission, 60,000*l*. The author adds, 'In the same ships are brought lumber, 15,000*l*., and skins and furs, 60,000*l*.' The trade of Maryland and Virginia was then almost wholly confined to the mother country; that to all places other than Great Britain having been carried on in shipping, the aggregate measurement of which did not exceed 1000 tons annually. The export trade of Pennsylvania, at that time, consisted of agricultural produce, which was sent principally to Spain and Portugal, and the proceeds remitted to England in payment for manufactures, to the amount of 150,000*l*. The produce of the New England fisheries, amounting to 172,600*l*., was also remitted to Great Britain for the same purpose: besides which, masts for the navy, and other naval stores, were sent here, to the annual value of 400,000*l*., in exchange for British manufactures and East India goods. About the time just alluded to, the foreign trade of this country experienced a considerable increase. In Smith's 'Memoirs of Wool,' a work of much authority, published in 1747, it is stated, that 'before the year 1718, our foreign trade was chiefly confined to London, Bristol, and Liverpool; but it is now become so general, that not one seaport, and scarce an inland town in the kingdom, is without adventurers, who export considerably, and correspond directly with most of the trading countries of Europe and America.' The early growth of our cotton manufacture is thus alluded to in these memoirs:—'The manufacture of cotton, mixed and plain, is arrived at so great a perfection within these twenty years, that we do not only make enough for our own consumption, but supply our colonies, and many of the nations of Europe. The benefits arising from this branch are such as to enable the manufacturers of Manchester alone to lay out above 30,000*l*. a-year, for many years past, on additional buildings. It is computed that 2000 new houses have been built in that industrious town within these twenty years.' It was not until half a century had elapsed, from the period referred to in the foregoing extract, and when they had secured their independence, that any part of the raw material employed in the cotton manufacture was received from the British plantations in America. A few bags of cotton, received in 1785 and 1786, were apparently of foreign growth, and had been received in America from the Spanish main. Cotton was raised in gardens in the United States before 1786; but that was the first year in which it was cultivated by planters as a crop; and 1787 was the earliest year in which any of the growth of the country was exported. Before the separation of the British provinces from the mother country, the statements which were given concerning their trade exhibited that of each province separately. For a long period, prior to the independence of America being recognised, the operation of the navigation laws had given to this country a monopoly of the trade with its colonies; and, it is worthy of remark, that so long as the American provinces continued thus connected with

England, the increase of the commercial intercourse bore a very inadequate proportion to their increasing population. In 1749, the number of inhabitants in the provinces was stated to be 1,046,000; and the official value of exports and imports, was 2,117,845*l*. Assuming that the population, between 1749 and 1774, increased steadily at the rate afterwards exhibited by the census of 1790, the number of inhabitants in 1774 must have been 2,803,625. If the trade had increased in an equal ratio, the imports and exports in 1774 would have amounted to 5,676,523*l*.; whereas the actual amount was only 3,964,288*l*., shewing a deficiency of 30 per cent. It is probable that the estimate of the population in 1740 may have been below the truth; but we can scarcely imagine that it would be wrong to any thing approaching so great an extent as would render the trade of the two periods proportional; and it is impossible to believe otherwise than that there had been a virtual diminution of trade between England and the North American provinces in the twenty-five years that preceded the war of independence. The earliest census for the United States was taken in 1790, when the population was found to be 3,929,328. The official value of our trade with the United States, in that year, was 4,622,851*l*. In 1800, the population was found to have increased to 5,309,758. At the same rate of increase, the trade in that year should have been 6,246,925*l*.; but, as it actually amounted to 9,243,432*l*., the increase was greater than that of the population by 48 per cent. In 1810, the population was 7,239,003, and the trade 10,427,732*l*. If the proportion of 1790 had been preserved, the amount would have been 8,517,739*l*. The excess, after allowing for the increased population, was, therefore, 22 per cent; but if the comparison is made with 1800, it appears that the increased trade is not quite 13 per cent, while the population was augmented at the rate of 36 per cent: there is, therefore, a virtual deficiency of 23 per cent, which is, without doubt, to be ascribed to the operation of the orders in council issued in retaliation of the Milan and Berlin decrees of Napoleon. Pursuing the comparison to 1820, we find that the population was then 9,638,166, shewing an increase, over 1810, of 33½ per cent; on the other hand, there is a falling off in the official value of the trade between the two countries at the rate of 27 per cent. This circumstance must be attributed to causes of a temporary nature, and which are capable of easy explanation. On the renewal of the intercourse between England and America, after the peace in 1815, our merchants and manufacturers, stimulated doubly by the deficiency of British goods in the American market, and their superabundance, and consequent low price at home, made such large shipments of manufactures to the United States, that a glut was there produced; and, as this occurred simultaneously with a considerable derangement of the currency in the commercial cities of America, English goods were sacrificed at ruinous prices. In the meantime, the commercial distress which had visited our own country was passing away, and an effective demand for our products had arisen from other quarters, as appears from the fact, that although the real value of British goods exported to the United States, which, on the average of the five preceding years, was near 9,000,000*l*., fell, in 1820, to 3,875,286*l*., the general exports from the United Kingdom to foreign countries were greater in 1820 than they had been in the preceding year. In 1830, the date of the last census, the popu-

lation of the United States was 12,856,165, and the official value of the trade with this country, 16,292,639 $\frac{1}{2}$ . The increase, as compared with 1790, was 227 per cent on the population, and 252 per cent on the amount of trade. If the comparison is made with the remaining decennary periods, it will be found that the increase in 1830 was as follows:—

Compared with 1800	Population.	Trade.
1810 .. 77 $\frac{1}{2}$ .. 56	142	76
1820 .. 33 $\frac{1}{2}$ .. 115	77 $\frac{1}{2}$	56

The increase of population in the United States, between 1820 and 1830, was at the rate of 3 $\frac{1}{2}$  per cent per annum. If we assume that the increase has since gone forward at the rate of 3 per cent in each year, the number of American citizens in 1835 must have been 14,784,589. The official value of their trade with this country in that year was 25,671,602 $\frac{1}{2}$ . A comparison of this amount with the value of the trade in the years of the different enumerations, exhibits the following results:—

Compared with 1790	Population.	Trade.
1800 .. 178 .. 177	276	455
1810 .. 104 .. 145	178	177
1820 .. 53 .. 239	104	145
1830 .. 15 .. 57	53	239

It is not simply with reference to the numerical increase of the citizens of the United States that we should consider this question of the increase of our trade. During the forty-seven years that have elapsed since the first census was taken, in 1790, at least 11,000,000 of inhabitants have been added to their number, being equal to an increase of 276 per cent. But during that time we are fully warranted in believing that the wealth of the country has been augmented in a much greater proportion; and it may be fairly presumed that, but for the untoward interference of wars, and of that which is scarcely less inimical to national prosperity than war—commercial jealousy, the dealings between the two countries must have become far more considerable than they are. During the period in question, America has added materially to her means of consuming foreign products, by the extent to which she has carried the cultivation of exportable products. In 1791, the whole export of cotton from the United States was under 200,000 lbs.; and the average annual importation of American cotton into this country, during the last ten years, has exceeded 225,000,000 lbs., the value of which cannot have been less than 7,600,000 $\frac{1}{2}$  per annum. In 1836 our importation was 289,615,692 lbs., which, at the average price of the year, probably produced more than 10,000,000 $\frac{1}{2}$  sterling. Under the system of restriction acted upon in this country (how wisely it is not our present purpose to inquire), with the declared object of favouring the produce of our own soil, and of loading with discriminating duties such articles, the produce of other countries, as come into competition with the productions of our colonies and dependencies, the trade between us and the United States must have dwindled away to perfect insignificance, but for the adoption and great encouragement that has been there afforded to the cultivation of cotton. On the other hand, it may fairly be doubted whether, but for the resource that has been so unexpectedly found in the fertile valleys of the Mississippi, our cotton manufacture, so far from having attained its now gigantic growth, could ever have ranked among the staple productions of England. The intercourse between this country and the United States is important, not only to our merchants

and manufacturers, but also to our ship-owners, and that in a continually augmenting degree. The tonnage of vessels which entered the ports of the United States from foreign countries, in each year, from 1821 to 1836, distinguishing American and British from other shipping, was as follows:—

Years ending 30th September.	American.	British.	Other Foreign Vessels.	Total.	Centesimal Proportion of British to American Tonnage.
1821	765,098	55,188	26,338	846,624	7-21
1822	787,061	70,699	29,872	887,632	8-97
1823	775,271	89,553	29,915	894,739	11-55
1824	850,033	67,351	35,016	952,400	7-92
1825	890,754	63,036	29,891	973,681	7-15
1826	948,206	69,296	36,329	1,047,860	7-35
1827	918,361	99,114	38,475	1,055,950	10-79
1828	866,381	104,167	40,056	1,010,604	11-89
1829	872,949	86,577	44,366	1,003,892	9-69
1830	967,527	87,531	44,689	1,099,747	9-02
1831	922,853	215,987	66,061	1,204,900	22-30
1832	949,822	236,841	100,197	1,346,860	30-41
1833	1,111,441	283,487	113,218	1,608,146	34-50
1834	1,074,670	453,496	114,557	1,642,723	42-19
1835	1,352,653	529,922	111,388	1,993,963	39-18
1836	1,255,384	547,606	132,607	1,935,597	43-62

These figures do not in any way justify the complaints of those persons who can see nothing but ruin to the shipping interest of this country from the relaxation of our navigation laws, introduced by the late Mr. Huskisson, and adopted and carried out by his successors in office. The most interesting part by far of our trade with America consists in our exports of manufactured goods. The extent of the shipments in 1815 is evidently the result of the renewal of commercial intercourse after the war, but the years 1805, 1806, and 1807, 1835 and 1836, followed long periods of friendly intercourse. The serious falling off that occurred in 1808 and 1809 must, as already stated, be attributed to the effect of our celebrated orders in council, issued in retaliation for Napoleon's Milan and Berlin decrees. Nearly one-third of our foreign export trade in 1805, 1806, and 1807, was carried on with the United States. Our trade with the continental nations was destroyed as far as the power of France could destroy it, and under these circumstances it was of peculiar importance that we should preserve, as far as possible, a branch of trade which gave so much and such constant employment to our merchants and manufacturers. It is difficult to account for the blindness and infatuation of the government, which could adopt a course by which what was so important to the nation, both commercially and politically, was put to hazard. The great political advantage of this trade may be thus explained. The merchants of the United States were accustomed to send American produce to the continent of Europe, to a much greater value than the goods they took in return. In their dealings with this country, their practice was directly the contrary; their purchases from us being always much greater than the American produce taken off by the English markets. The means for liquidating the balance thus raised against the American merchants were found in the circumstances of their trade with the remaining portion of Europe. The funds which those merchants had provided there in excess, furnished what was wanting to pay for the balance of their purchases from us, and a safe and most convenient mode of transmitting the funds for this purpose was offered in bills on the English treasury; the specie wherewith these were purchased being applied to pay subsidies and military charges on the Continent, for which this government was answerable, and for which it was difficult otherwise to provide. It cannot be necessary in this place to dwell upon the failure

which so signally attended the retaliatory orders in council of the English government. Our enemy had shut up every channel within his power through which our commerce could flow, and we, instead of looking out for new channels, or making the most of those which were beyond the control of our opponent, most unwisely aided him in his scheme, by putting a stop to all trade that was not conducted through those old accustomed channels. As might have been expected, the regulations of the belligerents were not such as the government of the United States would adopt for the prosecution of their trade with Europe. Finding that their flag was excluded from the ports of the Continent, except upon terms which they considered degrading, all commercial intercourse with either of the belligerents was interdicted; and the result, as it affected our manufactures, is apparent in the diminished amount of our exports. This system of non-intercourse was followed, as will be remembered, by a declaration of war against this country on the part of America, affording, it is to be hoped, the last instance in which two powerful countries, whose interests are so nearly identical in every pursuit that can increase the happiness and advance the true dignity of human nature, will suffer themselves to be dragged into hostility for the gratification of mistaken ideas of honour. The high degree of importance to each country of the trade which it carries on with the other, needs no further exemplification than is offered by the tables appended to this memoir.\* The proportions which that trade bears to the entire foreign trade of each country are there given. In this point of view, it would appear as if the intercourse were of more importance to America than it is to this country, inasmuch as the trade with the United Kingdom bears a larger proportion to the whole trade of the United States than our trade with those States bears to the whole foreign trade of this country. But, on the other hand, it may be truly said, that this densely peopled country is necessarily more dependent for prosperity upon its trade than America, and would suffer more from the loss of the smaller proportional amount of its commerce, which is involved in the intercourse we have been considering, than the United States would suffer from the loss of the much larger proportional amount of its trade which depends upon England.

\* Centesimal Proportion which the Trade between the United Kingdom and the United States of America bore to the whole Foreign Trade of each Country respectively, in each year, from 1821 to 1835.

Years.	Centesimal Proportion which the Trade with England bore to the whole Foreign Trade of the United States.	Centesimal Proportion which the Trade with the United States bore to the whole Foreign Export Trade of England.
1821	35-95	16-95
1822	38-16	18-57
1823	32-70	15-41
1824	31-75	15-86
1825	37-67	18-31
1826	29-00	14-77
1827	33-03	18-67
1828	34-75	15-78
1829	33-75	13-45
1830	33-13	16-02
1831	41-78	24-36
1832	35-99	15-00
1833	35-41	19-26
1834	39-61	16-43
1835	41-76	22-31

The proportion which our export trade with the United States bore to our whole export trade, was —

\* Several interesting Tables are given in the Report of this Section, confirmatory of the statements contained in it, which were found impracticable to be given in the *Literary Gazette*; and for which we must refer our readers to the Report itself.

In 1805 .....	28-01
1806 .....	30-31
1807 .....	31-80
1836 .....	23-28

"In the foregoing pages, all remarks upon the state of convulsion into which this most important branch of our foreign trade has lately been thrown have been avoided, partly because its occurrence is too recent to allow of a sufficiently calm estimate being made of the cause or causes which led to the catastrophe, but chiefly because it would be difficult, if not impossible, to enter upon the subject without departing from that line of strict statistical research which it is so desirable to preserve in the proceedings of this Section of the British Association. It is with much hesitation that I venture, in conclusion, to offer one remark, which, however, falls sufficiently within the limit thus drawn. The shipments of British produce and manufactures, in the year 1836, amounted, according to the value declared by the shippers, to 53,368,571l.; of which sum, America took 12,425,605l., or 23-28 per cent. The total shipments in 1835 amounted to 47,372,270l.; of which America took 10,568,455l., or 22-31 per cent; the difference between the two years being, on the total shipments, 5,996,301l.; and on the shipments to America, 1,857,150l. Without admitting or denying that these figures give evidence of over-trading, I would venture to call your attention to the circumstances of the two people—namely, that the means of obtaining the comforts of life are enjoyed by a larger proportion of them, than is the case with any other people; that the habits and predilections of the citizens of the United States lead them to give a preference to British goods; that ours is the cheapest market in which they can procure many articles necessary to them; and that we are, out of all proportion, their best customers for the raw produce of their soil; and I would then ask whether, if the trade of the two countries were put upon a proper footing, and conducted upon enlightened principles, that amount of traffic should be considered excessive which gives annually to every citizen of the United States articles of British growth and manufacture to the value of sixteen shillings and ninepence three farthings?"

Mr. Ashworth read a paper on the state of education at Bolton, prepared by the Manchester Statistical Society. It shewed that, out of a population of 50,000 individuals, there were 2665 children educated in day schools, 6983 in Sunday schools; making a total of 11,094 scholars, including the dame and infant schools. The proportion of children educated between the ages of 5 and 15 was only one-sixth, whilst in Prussia it is one-third of the whole population. Some striking facts were mentioned as to the incompetency of the teachers in the day schools generally. They were kept in cellars, and other unsuitable places; and in many the neighbours were accustomed to come in, smoke their pipes over the fire, and talk with the master. One schoolmaster, on being questioned about his system of instruction, said he followed "the *gravidley ould fashioned road*." One said that he had become a schoolmaster because he had lamed his foot. Another, a female, because she had "got poor, and *wur* a widow;" whilst several others said it was because they could not get a living by weaving.

From a discussion which ensued, it appeared that the greater part of the population was employed in the factories. A singular anomaly in the factory act was pointed out. That act provides that the children shall be allowed two hours a-day for school instruction, but makes no provision for a school being held. The con-

sequence is that the children are sent into a room, which is called the school-room, for two hours a-day, and then furnished with a certificate of their attendance at school. Several members expressed a strong opinion as to the necessity of legislative interference, both at Bolton at elsewhere; there being too much reason to believe that Bolton only affords a specimen of the general deficiency of the means of education.

*Education in the United States.*—Dr. Taylor read an abstract of a report, as presented to the legislature of New York by the regents of the university in that state. The statements proved that our transatlantic brethren are fully alive to the importance of national education, and are adopting the means most likely to secure its general dissemination.

Section G.—Dr. Lardner read a paper, by Mr. G. Remington, on the railway balance lock.

Mr. Williams next read a paper on what is called a treffos-pump, which led to a long discussion; and it may be observed that many of the questions raised in this section, such as those respecting railroads, iron-smelting and strength, steam vessels, the quantum of generation of steam from coal, mining engines, &c. &c. are of a nature to affect the fortunes of so many commercial men and manufacturers, that they generally gave rise to very conflicting opinions, and to close and anxious investigation and debate. The present question involved such considerations; and the actions and powers of a variety of pumps were diligently canvassed. In this case the alleged improvement was, that the pump would allow the water to flow in a continuous stream, while the well, or spring, might be at a considerable distance from the operation. By the diagram exhibited, it appeared that an air-tight tank, called a treffos, was placed near or over the well into which the water flowed through a pipe, at the top of which was a valve to prevent its descent again into the well. From the tank, or treffos, another pipe communicated with the pump. As the piston worked, the water arose through the valve into the treffos, which formed a reservoir; it then flowed through the communicating pipe into the pump, where the water was poured out in a continuous stream. The inventor stated, in his paper, that he had had three of these pumps at work for some time. One of them had the pump at the distance of ninety yards from the treffos. Against this, Mr. Evans said the continuous stream had already been obtained by more simple means; while Mr. Adams characterised the treffos as nothing more than a continuation and enlargement of the supply pipe.

Mr. Henwood of Penzance described a series of experiments which he had made with the indicator, on the expansion of steam in the cylinders of some of the large pumping engines on the Cornish mines. The instruments employed consist of a small cylinder, of which the piston is kept in its place by a helical spring, and on the top of the piston-rod a pencil is placed on the cylinder's stand; a frame of wood, in which a board slides horizontally, being moved by a string connected with the radius rod of the steam-engine's parallel motion, and returned by a counterpoise, suspended from the slider, over a small pulley. On this board a piece of paper is fixed, and the pencil on the piston-rod of the indicator describes on it a curved line which denotes the pressure of steam in the cylinder of the steam engine (and which elevates the piston of the indicator on its entrance from the boiler) at successive pe-

riods of the stroke. The first part of the curve thus generated by the composition of the motions of the slider and the piston is very irregular, and varies very much in different engines. This Mr. Henwood shewed to depend on the load of the engine, the pressure and quantity of steam in the boiler, and the size of the valve which admits it into the cylinder. The pressures of steam in the boilers varied from 15 to 65 lbs. on the square inch, above the atmosphere; and, owing to the peculiar construction of the Cornish boilers, there seems to be perfect safety in using such high pressures. The engines submitted to examination were at Huel Towan, Binner Downs, and East Crennismines: their cylinders respectively 80, 70, and 76 inches in diameter; and the length of stroke 10 feet. The duty performed 53, 73, and 74 millions of lbs., lifted one foot high by the consumption of one bushel of coal; and 1085, 1006, and 870 tons, lifted one foot high for the expense of one farthing.

A long and animated discussion followed, in which J. J. Guest, Esq., M.P., Dr. Lardner, Mr. Webster, Mr. Adams, and many other gentlemen, took a part. In this it seemed to be stated the best, and indeed at present the only pumping-engines used in Cornwall, are Watt's single engines; and that those of this construction, which are employed to give rotatory motion, although in some places they have been long in use, and do much better duty than the double-acting engines employed for similar purposes, do not come up to the duty of the pumping-engines. It was said by Mr. Henwood, that those engines which work with a load varying not very greatly from 10 lbs. on the square inch, and working from 6 to 8 strokes per minute, appeared to perform more work with a given quantity of fuel, than similar engines under other circumstances.

Mr. John Isaac Hawkins exhibited a small marble bust, sculptured entirely by machinery invented by him, and improved by Mr. Cheverton. Mr. Hawkins stated that the machine, by which this exquisite work of art was copied from the antique, without a single touch from the artist, is a species of engine lathe, in which the bust to be copied, and the block of marble to be sculptured, are placed in a frame, capable of almost universal motion, so that the block to be cut may be applied in all directions to a cutter in the lathe, while all the parts of the model are brought successively in contact with an index, fixed at such a distance from the cutter, as are the corresponding parts of the model and of the block.

Mr. Russell, whose admirable observations on the resistance of waves in inland navigation have, during the last two years, excited so much attention, and supplied such a mass of new and useful information, explained the practical results of some of his later experiments, in a manner highly suitable to the character of this section, reserving more theoretical remarks for the Section of Physics on the following day. The title of his paper, he said, ought properly to have been "The mechanism of waves, in relation to steam vessels in shallow water;" and his present communication might be considered a supplement to those which he had before made. Mr. Robinson and himself had been requested to make a series of experiments on the subject; but in this section he should only have to deal with the practical application. The previous investigations which he had made related only to the manner in which the resistance of bodies moving in the water was affected by the waves which they created. It had been found that several species of waves were gene-

rated in shallow water. He called the first of these the great wave of translation, as it differed from all others in not being a proper wave, but a translation of one great body of water taking place with an equal velocity throughout the whole depth. This was generated by the motion of a body through the water. This part of his discourse Mr. Russell illustrated by the exhibition of several drawings. The first was of a vessel at rest, placed at a given degree of immersion in a fluid of certain depth. The next shewed that, by a motion of four miles per hour, an anterior wave was generated, the water accumulating before the bows and at the sides of the vessel. This wave, Mr. Russell said, consisted of the fluid which she displaced by her motion. If this motion were increased, the anterior wave was increased. One of the drawings represented an extreme case which he had witnessed, where, in a depth of five feet, the anterior wave had so accumulated by increased speed, that the posterior portion of the vessel was left in so little water, that her rudder was knocked off against the bottom. The effect of the anterior wave, which carried with it the whole body of the water at equal velocity to the greatest depth, was to raise the prow, which was more deeply immersed, and to depress the stern as it were into a hollow: thus she had the same difficulty to contend with as if pressing up an inclined plane, besides the pressure of water at the bows to get through. It was found, also, that this wave moved with a given velocity, which was in proportion to the depth of the fluid. When in a rectangular channel, four feet deep, the velocity of this wave had been found to be as much as eight miles an hour. The boat being stopped altogether, the wave continued to go on with a velocity of eight miles an hour; and he had himself followed a wave of this description for a mile and a half, and had seen no diminution of its velocity. It had been found that, if the vessel could be so propelled as to be placed through or on the top of this anterior wave, then, if she were so constructed as to balance herself in this position, the immersion of the stern was diminished, the sinking of the stern corrected, the resistance which was offered before was overcome, and she was borne along at greater speed. There were places where steam navigation, to a great extent, took place in shallow water: such were the Thames and the Clyde—and he might mention the Mersey; but he thought the water was generally rather deep there. Various methods had lately been suggested for the improvement of rivers; and it had struck him that he could not apply his investigation to better purpose than to the discovery of how far they might bear on that improvement.

The remainder of this exposition, however, is so connected with later explanations from the same able source, that we are induced to postpone them, in the hope of being able to lay them before our readers altogether.

Mr. Fairbairn, called on by Dr. Lardner, said his experiments had been of a similar character to those of Mr. Russell. He had found with respect to the anterior wave, and those which were found in the wake of the vessel, that they were precisely similar to those described in Mr. Russell's diagrams. In one experiment which he had tried in the Union canal, which was five feet deep, they got to the speed of seven miles per hour, when the prow was raised as if the vessel were on an inclined plane, and the stern dragged against the bottom. There were many other curious phenomena attending his experiments. His experiments were made with a view to practical utility, and

his notions agreed with those of Mr. Russell. He had thought that the width of the stream had something to do with the matter, but he was glad the experiments of Mr. Russell had set that at rest.

A question was put by Mr. Herapath, as to whether Mr. Russell thought there was any advantage in letting vessels fall away with a long sweep towards the stern, which led to a long discussion on the best form of vessels, but did not lead to any definite conclusion.

Mr. George Webb Hall said, he had observed that in walls which had been built sloping to resist the action of the waves, the waves from steam-boats had had a tendency to hollow them or restore them to a rectangular form; thus the waves themselves confirmed the accuracy of Mr. Russell's observation, that rectangular banks or walls possessed all the advantages he had described in navigation.

Mr. Kingly exhibited a model of a new description of drawing-board, which, as it contains most of the implements and instruments used in geometrical drawing, is calculated to facilitate work.

At five o'clock, about five hundred members sat down to a sumptuous and well-arranged dinner in Lucas's Rooms. At the close of which, the Marquess of Northampton (chairman) gave "the Queen," and other loyal toasts, which were drunk with great applause. On proposing the health of the Earl of Burlington and prosperity to the British Association, the noble marquess alluded very happily to the close of his own reign, and the distinguished merits of his successor. The king never dies! Live the king! His noble friend, who bore the name of Cavendish and the title of Burlington, and inherits and represents the honours connected with them in the annals of science, he felt assured would discharge the duties he was now about to undertake in a manner which would be most advantageous to the Association. The toast was drunk with enthusiasm, and Lord Burlington returned his acknowledgments in a manner which amply justified the encomiums bestowed upon him, and the anticipation expressed of his reflecting credit upon the chair he was now called upon to fill.

The health of the Marquess of Northampton was also given with every demonstration of grateful regard for his past services; and his lordship, in return, with much good humour alluded to his approaching demise, and invited the company to the Amphitheatre to see him turned off.

#### General Evening Meeting.

At eight o'clock, the amphitheatre was crowded from floor to roof, and presented a very brilliant *coup d'œil*, both of *spectans* on the stage, and fair spectators in the audience part.

The Marquess of Northampton said, in opening the business of the evening, that the members of the British Association entertained no fears as to the reception they would meet with in the town of Liverpool—a town whose very existence depended in a great measure on science—connected as it was with almost every branch of commercial pursuits—a town whose vessels navigated the ocean to every quarter of the globe—a town which beheld science giving wings to carriages, and propelling them with a speed rivalling that of the courser in the race, or the eagle in the clouds—a town which could not but feel the importance of science, not only to the world at large, but to itself in particular. The members of the British Association came here, not as Conservatives—not as Reformers—not as Episcopals or as Dissenters—not as

members of the Church of England, or of any other persuasion; but they came bringing with them the olive-branch of peace: they came to teach one single lesson alone in a religious and political sense, and a most important lesson it was, which was contained in two words of sacred origin, which were, "Love one another." Science had three great objects in view; the first was the exercise and improvement of those intellectual faculties which were given to man by his Maker; the second, was the praise and glory of that Creator, arising from the numerous—he should rather say, innumerable—proofs of his wisdom and beneficence, which were scattered all around; the third, was the duty which they owed to their fellow-creatures,—that of promoting their happiness and welfare in every possible way. It had been said by some persons that the Society held up science as a sort of idol to be worshipped; but the members entertained no such idea. They certainly believed science to be worthy of the noblest faculties of man, but they did not deny that other subjects had superior claims to their consideration. Though they had nothing to do with politics, they did not deny the importance of the science of government, which concerned the welfare of all—and God forbid that they should deny the superior importance of that knowledge which was to make them happy for ever. They excluded religion for two reasons—the first of which was, that their time and attention were so fully occupied, that they really were not able to take other matters into consideration. Of course, they entertained their individual opinions on these subjects—some were of one opinion, some of another; but in science they united on a neutral ground. As a neutral ground, he thought it most important, both politically and religiously, for he hoped it might be the means of softening those asperities which unfortunately prevailed both in politics and religion. It was, alas! too true, that the name of religion had been used by those who abused it for purposes to which it ought never to be applied, whilst, on the other hand, faction had usurped the sacred name of patriotism. His noble friend, who was about to relieve him from the arduous, but honourable, situation which he held as president of the Society, had said pretty nearly the same thing to-day; but he (the Marquess of Northampton) could not retire from his arduous post without acknowledging his great gratification at the kindness with which his humble efforts to promote the objects and welfare of the Association had been rewarded. He was about to be succeeded by one who was by family descent a philosopher, and who in early youth had exhibited a strong bias towards scientific pursuit. The visit to Liverpool would be a fresh era in the existence of the Society. This was the second great commercial town they had visited. Bristol being the first. The British Association felt extremely gratified by the kindness with which they had been received. He was extremely happy to see so large an assemblage of ladies, as well as gentlemen; and he could not refrain from expressing the satisfaction with which the British Association received the influence derived from the presence of the fairer portion of the creation, as they could not but be certain that fair eyes were the harbingers of fair deeds.

The Earl of Burlington, president elect, then took the chair, and was received with the warmest plaudits of the meeting. His lordship said it was impossible for him to enter on the duties of the situation, without endeavouring to acknowledge his deep sense of the honour

which had been conferred upon him,—both to the highly valued friends who had proposed him, and to the members of the Association in general, for acquiescing in their proposal. It was as high a distinction as was in the power of men of science, and, therefore, in the power of any body of men whatever, to bestow. But, however highly he estimated the honour of presiding over the assembled science of Great Britain, there was another consideration,—for if it were a post of honour, it was, at the same time, a post of difficulty and anxiety. They were now assembled in one of the great commercial cities of the empire; and both the theoretical cultivators of science, and those who had benefited so largely from its practice, would derive material pleasure and advantage from this meeting. When he found enrolled amongst the members of this Association, and saw around him all the most distinguished cultivators of science in this country, and was called upon to preside over men whom he had been accustomed to reverence as the highly gifted interpreters of nature, he could not but feel that he had great reason to ask for their liberal indulgence. He regretted to see that some distinguished members of the Association were absent. For the first time they were deprived of the presence of Mr. Parker, to whom, more than to any other individual, the Association was indebted. To him they owed the vigorous and powerful address, explaining the necessity and objects of the Association; to him they owed the health and vigour which it had now obtained. He regretted to add, that Mr. Parker was no longer officially connected with the Association. Another member was also absent—a distinguished philosopher, whose career of discovery had earned him a reputation second to none of the present day—he alluded to Dr. Dalton, whom they had congratulated at Cambridge, four years ago, in the distinction conferred upon him by his sovereign. He deeply regretted that the infirmities of increasing age no longer permitted Dr. Dalton to honour them with his presence. Some of the vice-presidents were also absent; but Mr. Whewell, to whom the Association owed a deep debt of gratitude, was here. The Association had commenced its seventh session that morning; and it could not be amiss to inquire what had been the fruits of the last six years, and how far the Association had answered the objects for which it was intended. Had this Association, or had it not, given a stronger impulse and direction to the progress of scientific inquiry? If they surveyed the whole circle of the sciences, they would find none which stood undebted to this Association. It had afforded valuable assistance both to the past history and future progress of every department of science. To whatever quarter they turned, they found that not only had specific objects been pointed out, but that several were in the course of attainment. Astronomy; the most perfect of the sciences, in which was bestowed, almost exclusively, the specific inquiries of the last century, might be supposed to stand in no need of any assistance from the resources of the Association; but even in astronomy, at the instigation of this Association, government had undertaken to reduce the observations at Greenwich, which hitherto had remained perfectly useless in science. The subject of the tides had lately been taken up by two of the most distinguished philosophers of the present day, Mr. Whewell and Mr. Lubbock. This was a most inviting field for operations of the Association; and accordingly, they found that, by the aid of sums of money

voted by the Association, valuable discussions on tidal observations had been effected, the result of which had already been made known to the Association. If they turned to other sciences, still struggling in their infancy, they found the Association actively engaged in the task for which it was peculiarly calculated, that of calling forth the energies of each. In meteorology and magnetism, much had been effected; from the valuable barometrical observations made at Plymouth, under the superintendence of Mr. Snow Harris, very valuable results had been obtained. The Association had also procured Professor Lloyd's and Captain Sabine's valuable thermometrical observations on the coasts of Scotland and Ireland. If they turned to geology, to natural history, or medical science, they found that in all, an activity, rightly directed, had been infused; and when such were the results of the last six years, they had good reason to believe that their prospects were highly encouraging. Such meetings as this were calculated to diffuse information more widely; but this was not the primary object of the Association, which was rather the progress and advancement of science than its dissemination. All found that they could minister something towards this great end, whilst the few leading minds which could aspire to become discoverers of the laws of nature, would here find assistance from the co-operative spirit of the Association. If they looked to the vast fields of nature, compared the small extent subject to the inquiries of man, with the vast dominion of which he was yet unable to grasp the laws, and considered the many powerful minds which were now endeavouring to unravel those laws,—they must be strongly convinced that the human mind was destined to acquire a far deeper insight into the laws of nature, than it at present possessed. But whatever the progress which science was destined to make in future generations, it was both his ardent hope, and his confident belief, that it would never engender high conceit in the mind of man as to his own faculties, but would lead all men to acknowledge submissively, the power and the goodness of the Almighty.

Dr. Traill then proceeded to read the report at great length, which, being finished, Mr. Taylor, the treasurer, read the report of the accounts for the last year ending the 31st July. The balance brought forward, was 607*l.* 13*s.* 3*d.*: received in the year compensation from 209 life members, 985*l.*; Subscriptions for 1836 of 1121 annual members, 1121*l.*; for the year 1837, 26*l.*; for the year 1838, 24*l.* making the amount of subscriptions for the last year, 2126*l.* They had received dividends on 4735*l.* stock, 135*l.* for the sale of different volumes of the Association, 416*l.* 14*s.* 11*d.*; making the amount received on account of the Association, 3313*l.* 8*s.* 2*d.* The expenditure consisted:—Expenses various, 265*l.*; for the local treasurer's sundry disbursements, 135*l.* 14*s.*; purchase of 1000*l.* bonds 3 per cent, 800*l.*; salary of assistant secretary and accountant, 234*l.*; grants for scientific researches to the discussion committee on temperature, 97*l.* 10*s.*; for the present year, 186*l.* 11*s.*; tidal observations at Bristol, 150*l.*; for researches in lunar observations, 70*l.*; for the committee for meteorological observations, 93*l.* 10*s.*; researches on the form of waves, 100*l.* 12*s.*; experiments on the sounds and motions of the head, 8*l.* 4*s.* 6*d.*; researches with respect to atmospherical air, 11*l.* 18*s.* 6*d.*; for barometrical observations, 50*l.*; thermometrical observations, 150*l.*; chemical experiments, 24*l.*; making various payments, 372*l.* 12*s.* 4*d.*; for printing reports of fourth

volume, 536*l.* 11*s.*; abridging reports, 52*l.*; sundry printing and advertising, 41*l.*; balance in the hands of the treasurer, 248*l.*; making up 3313*l.* 8*s.* 2*d.* which, altogether, would leave the present prosperity of the Society previous to the meeting at Liverpool, at about 5000*l.* He begged to mention, that, at the close of the meeting at Bristol, the number of tickets issued, was 1305. When he left the Townhall that day at twelve o'clock, the number then issued, was 1412. That number seemed likely to be largely increased, and the funds of the Society seemed likely to receive here a large addition.

## POSTSCRIPT.

Liverpool, Thursday Evening.

HAVING, with the exception of two or three papers, and Dr. Traill's Report (which, we presume, will be published at length), given the principal details of the meeting, not only to the conclusion of the first day's proceedings, but with several interesting additions from after days, we shall subjoin a few particulars and observations which have occurred to the above date.

The principal subject which seems to have attracted the greatest notice and discussion, during the week, has been the manufacture of iron, in which many of the commercial, as well as of the philosophical, portion of the Association appear to have considerable interest. In one Section, the Mechanical, this topic has been investigated in various mechanical relations; and, to-day, the Chemical Section has been entirely occupied with it, after a very able report from Dr. Thomson, of Glasgow, in which he detailed a variety of experiments conducted with admirable skill and accuracy. This investigation of the same matter in different Sections is not a little perplexing to the reporter; and we feel that it will not be in our power, till the whole is closed, to take any thing like a complete view of any of the leading and most important questions. The same remark applies to the theories of tides and experiments on the resistance of fluids, &c.; also of much consequence to a vast number of the Association. These have been expounded in the Physical and Mechanical Sections; and it is as yet impossible to understand the results, which are, indeed, still undergoing examination. The same may be said of the fertile theme of education and other statistical inquiries, where the field is so vast, that volumes could not contain the accumulated data.

To-day the Zoological Section has flown on an excursion to the Earl of Derby's fine zoological collection at Knowsley, after having yesterday pretty well exhausted the interesting subject of Mr. Ward's preservation of plants under glasses, nearly, or altogether excluded from the air. This curious discovery, renders it easy to transport the plants of every climate to other regions. They exist by their own action in expiring oxygen and moisture, which they again and again re-absorb, and thus live for months or years without water or culture. Dampness, as Mr. Lindley, who read Mr. Ward's memoir, observed, was more dangerous than even excessive dryness; and instances were quoted, of many plants flourishing, flowering, and seeding, under these circumstances. It seems probable that the colouring matter in them does not reach perfection; but, in other respects, they are equal or superior to plants in the open air. The lower orders thrive best, but even vascular specimens succeed in growth and health.

A young gentleman in this Section gave an

account of one of three swallows taken out of solid ice (in November, in Germany), and restored to life by the heat of the hand. This accident led to a long conversation; but nothing transpired to induce an opinion, that the laws of nature were inverted as regards the swallow tribe, or to confirm the vulgar notion, that these birds continue to exist and hibernate under water.

It is not easy to afford an idea of the Geological Section. A young science, and always developing new features, its proceedings would of themselves be sufficient to bring together the more idle and curious of the assembly;\* but when we add, that the gallery is appropriated to, and filled by ladies; and that the chair is occupied by Mr. Sedgwick, we have intimated to all acquainted with the subject, that the combination, or aggregation, of attractions is irresistible. The wit and humour with which the president gilds the graver labours of science, are of the very essence of popularity. This morning, for instance, for the common cry of "*places aux dames*," he made a laughable appeal to such gentlemen as happened to occupy some of their front seats; which drove the intruders back, amid bursts of mirth, in which every person in the theatre joined. The tolerated nuisance being abated, a brief paper, by Sir D. Brewster, was read by Sir Philip Egerton, in which a new property of the diamond was not merely indicated, but almost demonstrated.

The fact connected with this is the most striking and original we have heard during the week. Whilst pursuing some of his beautiful experiments on light with diamond lenses, this acute observer found that the stone was variegated with lines of unequal structure and refraction. These lines appeared on the drawing to be parallel, and running quite across the disc; and, from this appearance, Sir David immediately suggested that the diamond was a vegetable substance. Indeed, there is very little doubt but that, as coal is vegetable, so is also this pure crystal of carbon. Nothing but the process of its crystallisation can explain the property here noticed and described.

The coal fields of Lancashire filled the rest of the day.

In the Mechanics, yesterday, the debates were rather stormy, and some of Dr. Lardner's remarks touching steam navigation, provoked warm opposition. This will, no doubt, be revived, as opinions are much diversified on the question of fuel, &c. necessary for the accomplishment of distant voyages.

At three o'clock the general committee meet to determine on the place of assembling next year; and we shall keep our packet open to communicate the determination, if in time, without troubling the public with the discussion, which is expected to be somewhat complicated.

Birmingham and Newcastle are the competitors, and the latter looks like the favourite; but we hear there is a little perplexity in consequence of two presidents having been spoken of: to wit, the Duke of Northumberland and Lord Durham. Either of these are most eligible, and, perhaps, it may be arranged (if Newcastle be selected) to enrol them both, the duke as president, and the noble earl as vice-president, to take an active part at the head of the proceedings. We shall, however, know in a few hours; and we have only to repeat that, to the present moment, every thing has gone off most liberally and satisfactorily.

\* The Statistics Section is, in some respects, also, the resort of the more general body of inquirers.

To maintain the high character of Liverpool for spirit and hospitality, the corporation, after some debate as to legal forms, granted 200*l.* to Mr. Earl, the mayor, for expenses in entertaining the Association. A voluntary subscription, amounting to about 1100*l.*, was raised in furtherance of the same object, in various ways and places; and at the same time the hospitality of private individuals, particularly the local secretaries, treasurer, council, &c. &c. has been unlimited. Above 600 members belonging to Liverpool have also been enrolled, and on Wednesday afternoon the total number amounted to above 1720, or 400 more than ever met on any former occasion.

Among the other beneficial effects of these meetings, we may mention that a Statistical Society is likely to be formed in Liverpool under the auspices of Lord Sandon; and an ordinance map of Scotland, similar to the splendid one of Ireland, is to be begun next year by order of government.

Among the other civilities so largely shewn to the members of the British Association at Liverpool, the following places and objects have been thrown open to them for inspection or relaxation:—

*Institutions.*—Royal Institution; Athenæum Library and News-room; Lyceum Library and News-room; Exchange News-room; Union News-room; School for the Blind; School for the Deaf and Dumb; Blue-Coat Hospital; Workhouse; and the Infirmary.

*Public Commercial Buildings.*—New Custom-house; Tobacco Warehouse, King's Dock; Telegraph Station; Chain-Cable Testing Machine.

*Churches and Monuments.*—St. George's—Stained Glass Window; St. James's Cemetery, with Chapel and Huskisson's Monument.

*Painting and Sculpture.*—Statuary at Charles Blundell's, Esq., Inc., on application to Samuel Turner, Esq., the local treasurer, and one who has shewn abundant hospitality to very many of the members.

*Gardens.*—Botanic Garden; Mr. R. Harrison's Collection of Plants.

*Manufactories.*—Liverpool and Manchester Railway Stations and Work-shops; Gas Works; Fawcett and Preston's Foundry and Steam Engine Manufactory; G. Forrester and Co.'s Foundry and Engine Manufactory; Bury and Branker's Clarence Foundry and Locomotive Engine Manufactory; Logan's Chain-Cable Manufactory; Lyon's Stained Glass Manufactory, and Wax Busts; Union Crown-Glass Company's Works; Muspratt's Chemical Works, at Newton and Liverpool.

*Ship-Building Yards.*—Messrs. Humble and Milchreest's Steam Ship; Mr. Laird's large Iron Steam-vessel.

*Excursions.*—Earl of Derby's Zoological Collection and Picture Gallery, Knowsley; Salt Mines, Northwich; Rock Lighthouse and Fort; Worsley Collieries and Tunnels; and, through the kindness of the Rock Ferry Company, a swift steam-boat has been placed at the disposal of the meeting for the purpose of an excursion.

Also, the Town Hall, with Chantry's Statue of Caning, and View from the Dome; Nelson's Monument, Exchange; St. John's Market; the Docks; American Packet Ships; Necropolis; Zoological Gardens (admission, one shilling); Annual Exhibition of Pictures (admission, one shilling); Remains of the Submarine Forest and Embankment, Leasowes; Remains of Submarine Forest, Crosby.

The president and members of the Liverpool Academy also liberally offered to light up their exhibition rooms on Friday evening, and to admit members and their ladies at seven o'clock on shewing their tickets; and an invitation from manufacturers at Manchester offered their works, &c. to be seen by any members of the Association. We did not hear that the railroad directors had offered any facilities for transit, which rather surprised us.

#### General Committee.

*Five o'clock.*—The minutes of the preceding meeting having been read by Mr. Phillips and confirmed:

The applications from Newcastle, the Corporation, Coal-owners, Literary and Philosophical Societies, the Bishop of Durham, &c. &c. were read by Mr. Murchison.

2d. From Birmingham.

3d. From Sheffield.

4th. A verbal communication from Man-

chester, requesting that the application from that town should be kept on the books.

5th. From Cheltenham.

The claims of Newcastle were urged by Professors Johnstone of Durham, and other gentlemen; those of Birmingham by the low bailiff and Mr. Corrie (the latter in a very impressive address), and the other places by other deputies, when it was moved and carried that the next meeting should be at Newcastle.

It was afterwards moved and carried, that the

Duke of Northumberland should be President.

Lord Durham, the Rev. Vernon Harcourt, and Prideaux Selby, Esq. of Twiser (the distinguished naturalist) Vice-Presidents.

J. Adamson, W. Hutton, Esq. and Professor Johnstone, Local Secretaries.

Rev. W. Turner and J. Bigge, Esq., Local Treasurers.

#### REVIEW OF NEW BOOKS.

*The Vicar of Wrexhill.* By Mrs. Trollope, author of "Domestic Manners of the Americans," "Tremordyn Cliff," &c. 3 vols. 12mo. London, 1837. Bentley.

THIS is certainly the best novel that Mrs. Trollope has produced, as regards dramatic execution or development of character. It is the history of a modern *tartuffe*, and shews how the highest and best feelings of our nature may be turned to evil by evil guidance, and by misdirected enthusiasm. The more deeply we are impressed by the great truths of Christianity; the more that we feel they are the safeguard of life, and the hope of death; the more should we guard against the delusions of fanaticism, for the fanatic and the hypocrite are inseparable companions. We firmly believe that the exaggerating and self-righteous saint does more harm to the cause of religion than even the infidel. The falsehood and coldness of disbelief must, sooner or later, find their own insufficiency; but the small vanities, shrouded under the sweeping condemnation of others; the horror wasted on trifles, which should be kept for graver offence; and the severity so contrary to the Gospel,—all these are so calculated to excite disgust and ridicule, that religion is confounded with, and injured by, those who indeed take its name in vain. Mrs. Trollope has drawn a picture of such a state, with much force and point—our only objection is, that there are some portions too coarsely coloured. For example, the scene which leads to Helen's leaving her mother's house, is decidedly objectionable. No taste can be too fastidious when we consider the class of readers among whom works like the present chiefly circulate. We now proceed to give a scene among the "regenerated," which, however mistaken and absurd, is only too faithful.

"A few minutes more brought them to the door of Mrs. Simpson's. Their inquiry for the lady was answered by the information that she 'was schooling Miss; but if they would be pleased to walk in, she would come down directly.' They accordingly entered the drawing-room, where they were kept waiting for some time, which was, indeed, pretty generally the fate of morning visitors to Mrs. Simpson. The interval was employed as the collectors of albums and annuals intend all intervals should be, namely, in the examination of all the morocco-bound volumes deposited on the grand round table in the middle of the room, and on all the square, oblong, octagon, and oval minor tables, in the various nooks and corners of it. On the present occasion, they

seemed to promise more amusement than usual to the party, who had most of them been frequently there before,—for they were nearly all new. Poor little Fanny, though she knew that not one of those with her were capable of enjoying the intellectual and edifying feast that almost the first glance of her eye shewed her was set before them, could not restrain an exclamation of ‘Oh! how heavenly minded!’ The whole collection, indeed, which, though recently and hastily formed, had evidently been brought together by the hand of a master of such matters, was not only most strictly evangelical, but most evangelically ingenious. Helen, however, appeared to find food neither for pleasantry nor edification there; for having opened one or two slender volumes, and as many heavy pamphlets, she abandoned the occupation with a sigh, that spoke sadness and vexation. Miss Cartwright, who had seated herself on the same sofa, finished her examination still more quickly, saying, in a low voice, as she settled herself in a well-pillowed corner, ‘Surfeit is the father of much fast.’

Miss Torrington and young Mowbray got hold of by far the finest volume of all, whose gilt leaves and silken linings shewed that it was intended as the repository of the most precious gifts that, according to the frontispiece, genius could offer to friendship. Having given a glance at its contents, Charles drew out his pencil, and on the blank side of a letter wrote the following catalogue of them, which, though imperfect as not naming them all, was most scrupulously correct as far as it went:—

‘Saint Paul’s head sketched in pen and ink;  
‘Here’s the bower,’ to words of grace;  
The death-bed talk of Master Blink;  
Lines on a fallen maiden’s case;  
Sonnet upon heavenly love;  
A pencil drawing of Saint Peter;  
Emblems—the pigeon and the dove;  
Gray’s Odes, turned to psalm-tune metre.  
A Christian ode in praise of tea,  
Freely translated from Redi.’

He had just presented the scrap to Rosalind when Mrs. Simpson entered, leading her little girl in her hand; but the young lady had leisure to convey it unnoticed to her pocket, as the mistress of the house had for the first few minutes eyes only for Fanny. In fact, she literally ran to her the instant she perceived her little bonnet; and folding her arms round her, exclaimed—‘My dear, dear child! My dear, dear sister! This is providential! It is a blessing I shall remember always! Our minister told me I should read at a glance the blessed change wrought upon you: I do read it, and I will praise the Lord therefore! I beg your pardon, ladies. Mr. Mowbray, pray sit down—I beg your pardon: I rejoice to see you, though as yet—’ Her eyes fixed themselves on the bonnet of Rosalind, which, besides being large, had the abomination of sundry bows, not to mention a bunch of laburnum blossoms. ‘Ah! my dear Miss Helen! The time will come—I will supplicate the Lord always that it may—when you too, like your precious sister, shall become a sign and ensample to all men. How the seed grows, my sweet Miss Fanny!’ she continued, turning to the only one of her guests whom, strictly speaking, she considered it right to converse with. ‘How it grows and spreads under the dew of faith and the sunshine of righteousness! It is just three months, three little blessed months, since the beam first fell upon my heart, Miss Fanny; and look at me, look at my child, look at my albums, look at my books, look at my card-racks, look at my missionary’s box on one side, and my London Lord-days’ society box on the other. Is not this a ripening and preparing for the harvest,

Miss Fanny?’ Fanny coloured, partly, perhaps, from pride and pleasure; but partly, certainly, from shyness at being so distinguished, and only murmured the word ‘Beautiful!’ in reply. Miss Mowbray felt equally provoked and disgusted; but, while inwardly resolving that she would never again put herself in the way of witnessing what she so greatly condemned, she deemed it best to stay, if possible, the torrent of nonsense which was thus overwhelming her sister, by giving another turn to the conversation. ‘Have you seen Mrs. Richards lately, Mrs. Simpson?’ said she. ‘Mrs. Richards and I very rarely meet now, Miss Mowbray,’ was the reply. ‘The three young ladies, indeed, I am happy to say, have wholly separated themselves from their mother in spirit, and are all of them becoming shining lights. Oh, Miss Fanny! how sweetly pious are those lines written between you and little Mary!’ Fanny suddenly became as red as scarlet. ‘The alternate verses, I mean, in praise and glory of our excellent minister. He brought them to me himself, and we read them together, and we almost shed tears of tender blessing on you both, dear children!’ Charles, who thought, and with great satisfaction, that whatever stuff his poor little sister might have written, she was now very heartily ashamed of it, wishing to relieve her from the embarrassment which, nevertheless, he rejoiced to see, rose from his chair, and, approaching a window, said, ‘What a very pleasant room you have here, Mrs. Simpson; it is almost due east, is it not? If the room over it be your apartment, I should think the sun must pay you too early a visit there unless your windows are well curtained.’

‘Oh, Mr. Mowbray! Sunrise is such a time of praise and blessing, that, even though the curtains are drawn, I always try, if I am awake, to think how heavenly it is looking outside.’ ‘Are you an early riser, Mrs. Simpson?’ said Helen. ‘Not very,—at least, not always; but since my election I have been endeavouring to get down to prayers by about half-past eight. It is so delightful to think how many people are coming down-stairs to prayers just at half-past eight!’ ‘Your little girl is very much grown, Mrs. Simpson,’ said Miss Torrington, willing to try another opening by which to escape from under the heels of the lady’s hobby; but it did not answer. ‘Hold up your head, Minima, dear,’ said the mamma; ‘and tell these ladies what you have been learning lately. She is still rather shy; but it is going off, I hope. Precious child! she has grown such a prayerful thing, Miss Fanny, you can’t imagine. Minima, why did you not eat up all your currant-pudding yesterday? tell Miss Fanny Mowbray.’ ‘Because it is wicked to love currant-pudding,’ answered the child, folding her little hands one over the other upon the bosom of her plain frock, no longer protruding in all directions its sumptuous *cheveux-de-frise* of lace and embroidery. ‘Darling angel! And why, my precious! is it wicked?’ ‘Because it is a sin to care for our vile bodies, and because we ought to love nothing but the Lord.’

*A Blunder in furnishing a Religious Library.*—‘But we were once very near getting a book, which, I have been told, is of the most exquisite interest and pathos of any in the language, by a pleasant blunder of Mrs. Mowbray’s. I chanced to be in the room with her one day, when she read aloud an old advertisement which she happened to glance her eye upon, stitched up in a Review of some dozen years’ standing, I believe. ‘Some Passages in the Life of Mr. Adam Blair, Minister of the

Gospel.’ ‘That’s a book we ought to have,’ said she, very solemnly; ‘Rosalind, give me that list for Hatchard’s, I will add this.’ I took up the advertisement as she laid it down, and, not having it before her eyes, I suspect that she made some blunder about the title; for, when the box came down, I took care to be present at the opening of it; and, to my great amusement, instead of the little volume that I was hoping to see, I beheld all Blair’s works, with a scrap of paper from one of the shopmen, on which was written, ‘Mrs. Mowbray is respectfully informed, that the whole of Blair’s works are herewith forwarded; but that J. P. is not aware of any other life of Adam than that written by Moses.’”

There is a very lively sketch of a “serious fancy-fair;” but we must content ourselves with a brief description of the *serious pincushions*:—

“By far the greater half of these articles were pincushions, and, for the most part, they packed and unpacked well and safely; but, amidst the vast variety of forms into which this favourite vehicle of charity was turned, some among them were equally ingenious in design, delicate in execution, and difficult of carriage. There were harps, of which the strings were actually musical, and the foot a pincushion. Old women of pasteboard, washing their feet in a pasteboard tub; but with knees stuffed for pincushions. Pasteboard hunchbacks, the hunches being pincushions. Babies dressed with the nicest taste and care, their plump little necks and shoulders forming pincushions. Pretty silken volumes, lettered ‘pointed satires,’ and their yellow edges stuffed for pincushions. Ladies very fashionably dressed, with the crowns of their bonnets, and their graceful backs, prepared as pincushions. These, and ten thousand more, of which a prolonged description might probably prove tedious, formed the staple commodity of the elegant booths, which stretched themselves in two long rows from one extremity of the beautiful lawn to the other.”

These are but follies for laughter; but Mrs. Trollope has drawn a grave and sad picture of how doubt springs up from hypocrisy; and of the fatal disunion among friends and families engendered by this self-seeking spirit of oversanctity. Henrietta Cartwright is a vigorous and original sketch; but about true religion there can be no mistake—by its fruits shall ye know it. The spirit of Christianity is kindness, and its basis is charity.

#### ARTS AND SCIENCES.

##### RETURN OF CAPTAIN BACK.

THE welcome intelligence of the safe return of Captain Back and his crew, after an absence of fifteen months; during which they were exposed to hardships and dangers almost unparalleled; and the deep interest felt by the public in the fate of this gallant officer and his intrepid crew, will cause the following authentic account of the voyage, which we have the gratification to lay before our readers, to be received with great interest.

We need hardly premise, that H. M. S. Terror, strengthened and prepared in every way for encountering the ice, sailed from England in June 1836, with the intention of proceeding to Repulse Bay, or Wager Inlet, on the north-western shore of Hudson’s Bay;—thence an exploring party was to cross over the supposed isthmus to the Arctic Sea, with the hope of coasting along, and determining the outline of the northern shores of America. The following letter will shew that the physical obstacles

that opposed themselves to this undertaking were utterly insurmountable.

*To the Secretary of the Geographical Society.*  
September 11, 1837.

Sir,—As the expedition, from which I have just returned, originated with the Geographical Society, and at its recommendation, was most liberally carried into effect by his majesty's government, I feel it incumbent on me to offer to the Society an outline of the principal events which occurred, from the time of my quitting England, in June 1836, till my return to Lough Swilly, on the night of Sunday, the 2d instant.

In a statement of this description, it would be impossible to enter into the detail of all the extraordinary, and I may say unparalleled, circumstances which have marked the course of the whole of our proceedings: such details I trust I may shortly be enabled to afford to the Society and to the public in a more complete form, but, in the mean time, it is due to those who took so warm an interest in the expedition, to furnish them with an authentic narrative of the voyage, which must, however, necessarily be very brief, and will consist of extracts selected from my daily journal, as better calculated to convey a correct impression of the singular occurrences to which we were witnesses.

June 23. We took our departure from Papa Westra, and steered across the Atlantic: the weather stormy.—July 20. We fell in with the ice, and, on the following day, we first saw the coast of Labrador, near Cape Chudleigh.—Aug. 1. Passed through Hudson's Straits; and, on the 5th, saw some of the company's ships, apparently beset with ice, off the North Bluff. By keeping close in with the land, we got a-head, and lost sight of them; and, on the following day, we were ourselves hampered. The ice was compact, and covered the horizon towards Hudson's Bay, as far as could be seen from the mast-head, while to the north-west it presented a contrary appearance. I had, therefore, no hesitation in proceeding in that direction.—Aug. 16. We got a run of forty miles from Trinity Isles; yet did not get sight of Baffin Island till the 23d, when we also saw Southampton Island to the S.W. Two days of westerly wind at this crisis would have enabled us to reach Repulse Bay; but easterly winds prevailed, and packed the whole body of ice in such a manner, that all hope of retracing our steps to pass to the southward of Southampton Island, and up Sir Thomas Roe's Welcome, was out of the question. On the 29th we were drifted by the ice to lat.  $65^{\circ} 50' N.$ , long.  $82^{\circ} 7' W.$ : this was our extreme north point, and here we were within about forty miles of Winter Island, where the Hecla and Fury passed the winter of 1821. By dint of wearing, the ship was worked to the southward towards Southampton Island, whither we were attracted by the flattering appearance of lanes of open water.—Sept. 4. We were only 136 miles from Repulse Bay, and two days of strong breeze would have led us through Frozen Strait to our destination. During the next fortnight we continued drifting slowly to the westward, passing within three miles of Cape Comfort, a bluff headland, rising about 1000 feet above the sea.—Sept. 20. We were seriously nipped by the ice; so much so as to start some of the ship's fastenings. On the 22d, being within twenty-five miles of the Duke of York's Bay, we tried to cut through the ice, but found it impracticable, as it closed immediately. From this date the ship was no longer under our own guidance; but, being closely beset, was carried to and fro, according to the wind and tide.—Sept. 26. We were drifted into lat.  $65^{\circ} 48'$ ,

long.  $83^{\circ} 40'$ , our extreme western point, and ninety miles from Repulse Bay.—Sept. 27. A rush of ice from the eastward lifted the ship's stern  $7\frac{1}{2}$  feet out of the water. Constant easterly winds.—Oct. 9. A clear channel in shore as far as Cape Bylot, for the space of twelve hours, and again on the 27th; but we were so completely frozen up, we could not take advantage of it; although, to effect so important an object, the ice-saws, axes, and every other implement, so liberally supplied by government, were put in requisition, and all the energy of both officers and crew was strained to the utmost.—Oct. 17. The thermometer fell to  $9^{\circ}$  below zero of Fahrenheit. In the beginning of November, the ship was housed in, and every arrangement made for meeting the rigour of winter. Snow walls were raised round the ship; and in this manner we drifted to and fro off the high land of Cape Comfort, at times carried so close to the rocks as to excite alarm for the safety of the ship.—Dec. 21. A furious gale from the westward drove us off shore, fourteen miles to the eastward of Cape Comfort, from which point the coast, not before laid down on our chart, was surveyed as we drifted to the south-eastward, for the distance of about 120 miles, as far as Seahorse Point, the eastern extreme of Southampton Island. The general character of the coast, barren hills and cliffs, varying from 750 to 1000 feet above the sea. On Christmas-day, the first symptoms of scurvy shewed themselves, which gradually extended itself to all hands. At one time twenty-five men were suffering severely from it; but, eventually, only three persons fell victims to this dreadful disease; viz. the gunner and two seamen. In the beginning of January, during a calm, our floe of ice split with a fearful crash; and this was the commencement of a series of shocks, that nothing but the great strength of the mass of timber and iron employed in fortifying the ship could have withstood: as it was, the vessel strained in every direction.—Feb. 18. Early in the morning, thermometer at  $33^{\circ}$  below zero, a disruption of the ice took place; and waves of thirty feet high were rolled towards the ship, which complained much. The decks were separated, the beams raised off the shelf-pieces. lashings and shores, used for supporters, gave way; iron-bolts partially drawn; and the whole frame of the ship trembled so violently, as to throw some of the men down.

Yet this was not our worst disaster. On the 15th March, while drifting to the south-eastward, off a low point, since appropriately named "Terror Point," a tremendous rush of ice from the north-west took the ship astern; and although buried to the flukes of the anchor in a dock of ice, such was the pressure, that she was forced upon it, and at the same time thrown over to starboard. The sternpost was carried away, and the stern lifted seven feet out of the water. The same night a second rush of ice tore up the remnants of our floe, forced the ship on the ice, so that her forefoot was quite out of water. Her sunken stern was threatened by an overhanging wave of ice full thirty feet high; but which providentially stopped as it touched the quarter of the ship. The water poured in through the stern-frame, and the ship creaked and strained in every direction. Provisions were got on deck, the boats lowered, and every preparation made for the worst extremity; and in the darkness and silence of night, we calmly awaited the anticipated coming of another shock, which, to all human appearances, must have been the last. Heaven ordained it otherwise; and in this novel cradle of ice, we were drifted without

further injury to Seahorse Point. The ice that bore us was ascertained to be seventy-feet thick; and it was not until we had saved through long lines of twenty-five feet thick, at a future day, that the ship was freed from this situation. The position of Seahorse Point was determined to be  $63^{\circ} 43'$ , long.  $80^{\circ} 10' W.$ ; variation  $49^{\circ}$  westerly. The lowest temperature was  $53^{\circ}$  below zero, when both mercury and brandy were frozen.

On the 1st of May the ship, still on the ice, was drifted near Mill Island; thence to the southward of Nottingham Island, between it and Cape Wolstenholme, a perpendicular cliff of 1000 feet high; thence to the northward of Charles' Island, which we reached on the 21st of June. The ice now shewed symptoms of disruption, and we set all hands to work, with a 35-foot ice-saw worked by shears; and on the 11th of July, having sawed to within three feet, the ice split in a fore and aft direction, and liberated the larboard side. We immediately made sail on the ship, but found we could not extricate her from an iceberg between the fore and main chains. We again had recourse to saws and purchases, when the lump of ice, still fast to the ship, rose to the surface of the water, and threw the vessel on her beam ends, the water rushing in with frightful rapidity. All hands were instantly set to work again, and laboured day and night, unremittingly, at the fatiguing but indispensable operation of sawing; till, exhausted by their exertions, I was obliged to call them in from the ice for rest and refreshment. Not a quarter of an hour had elapsed from quitting the work, when a sudden disruption of the ice took place, and the mass crashed with terrific violence against the ship's side, snapping, apparently without effort, the lashings and spars that had been placed fearing this occurrence; and, but for the merciful interposition of Providence, all would inevitably have been crushed by the mass of ice on which they had just been labouring. As the ice separated the ship righted, and drifted along. Finding it impossible to hang the old rudder, a spare one was fitted, and sail made on the ship. It was an anxious moment, as we waited to see if she would answer her helm; and as she bore up before the wind, with her head towards England, a cheer of gratitude burst from all on board.

I had cherished, to the last moment, the hope that the damages sustained might not be so great as to prevent my pushing for Wager Inlet by Sir Thomas Roe's Welcome, and there to beach the ship and repair damages, while some in boats carried into effect the object of our expedition; but when I found that she required two pumps constantly going to keep her free, that both outer and inner sternposts were gone, the keel seriously damaged, besides various other casualties, I felt it became my duty, however reluctantly, to make the best of our way homewards. Fortunately, the early part of our passage across the Atlantic was favourable; but, subsequently, the weather became boisterous, and the leaks increased very much, so that we could barely keep her free with incessant pumping: to secure the ship, also, we were obliged to frap her together with the stream chain-cable.

On the 6th of August, we again passed through Hudson's Straits; and on the 3d of September arrived in Lough Swilly, not having let go our anchor since June 1836. The north-eastern stem of Southampton Island has been now surveyed, for the first time, by Lieut. Owen Stanley, who has also made various views of the coast, and a chart shewing

the track of the ship. The remarkable positions in which the ship was placed among the ice, are admirably illustrated by Lieut. Smyth, in a series of spirited and characteristic drawings. I cannot conclude this brief account without hearing testimony to the great assistance I have invariably received from Lieut. Smyth, and all the officers and crew employed under my command, in this expedition; to the cheerful obedience with which all orders were obeyed; and to the steadiness of behaviour evinced in circumstances of no common trial. To speculate on what might have been the result of this expedition, had ever I reached either Repulse Bay or Wager River, would now be idle; but I cannot resist the opportunity of recording my unaltered opinion as to the practicability of the service when once a party should have reached either of the before-mentioned starting places.

I have the honour to be, &c.

GEORGE BACK.

TO CAPTAIN WASHINGTON, R.N.  
Secretary R.G.S.

#### FINE ARTS.

*Portrait of Her Majesty.* By A. E. Chalon, Esq. R.A.

WE have so frequently had occasion to express our admiration of Mr. Chalon's taste and talents, that when we say we consider the work under our notice as, in every sense of the expression, his crowning effort, our readers will easily conceive that it must be a very attractive performance. It is a whole-length portrait, in water-colours, *debout*, of our youthful, gracious, and beloved sovereign, attired in the regal robes and jewels in which she appeared on dissolving the Parliament, and it presents a charming union of queenly dignity, and feminine delicacy and beauty. The countenance is exceedingly animated; the sparkling eyes, and the "lips apart," conveying the impression that her Majesty is in the act of speaking. Without any actual increase of the height of the figure, Mr. Chalon has contrived to give an appearance of additional stature, by placing the queen on an elevated platform, covered with white drapery; round the steps that ascend which the massy folds of the crimson-and-gold royal train gracefully wind, seeming to afford a firm and extended basis for the light and elegant structure above. The broad blue riband which crosses the breast, and to which the George is suspended, by the contrast of its cool colour, imparts additional splendour to the warm and rich tones of the robes and jewels. All the accessories of the picture are well introduced; especially the British lion, in bas-relief; the sculptured *fascies* partially veiled, in happy allusion to the amiable clemency of her Majesty's character; and some white roses peeping over a magnificent balustrade, emblematic of the spotless purity of a "virgin queen." This fine picture, which was painted expressly by royal command, is now in the possession of Mr. Moon, of Threadneedle Street; but we understand that it will be immediately placed in the hands of Mr. Cousins, whose skill as a mezzotinto engraver is well known; and who, no doubt, will exert himself to the utmost to render the plate his *chef-d'œuvre*.

#### DRAMA.

*Haymarket.*—Since our last, Mr. Phelps has attempted to play the part of *Hamlet*,—we regret to say the attempt has been an utter failure; incorrect as to reading—misconceived, and some words mispronounced. We feel sure this gentleman will yet take his place on the

London boards as a most respectable and useful actor; but it is in the mean time painful to behold him struggling to maintain himself in a position he is totally incapable of filling.

On Thursday, in *Othello*, Mr. Phelps was far more successful. In the early parts of the play, the soft and gentle passages, his truly fine voice and quiet style of acting were seen to more advantage than they have before been; but towards the end, the want of energy which we have already noticed was evident; and, consequently, in the last scene, every character seemed of more importance than *Othello*. Mr. Elton played *Iago* exceedingly well for Mr. Elton, who is certainly not quite first-rate. Miss Allison was a sweet and gentle *Desdemona*, and Miss Huddart one of the very best *Emilias* on the stage. Power continues to play to full houses.

*English Opera.*—An extravaganza, called *The Spitfire*, was produced at this house on Wednesday. After a bad opening scene, in which the waiter of an hotel speaks as no waiter ever did speak, and which, or, at least, part of which, scene might be omitted with advantage, the piece becomes more lively and bustling. There are many *quaintnesses*, and some good scenery in it, which, joined to the clever acting, may, when properly curtailed, render this trifle amusing for half an hour.

#### VARIETIES.

*Count Borolowski*, the celebrated Polish dwarf, died a few days since near Durham, where he had resided many years. He was a little under three feet in height, and within a little of a hundred years of age. Upon the principle of proportion, a man of six feet should live to be near two hundred years old; but length of days is not accorded according to length of legs. The count was exceedingly well made, and of an agreeable countenance. He married, we believe, a lady of the usual size, and, indeed, we remember to have heard, in our early days, of her setting him on the chimney-piece, in cases of conjugal dispute, till he promised greater obedience, was kissed, and lifted down.

*Weather-Wisdom.*—The weather during the past week has verified the prediction. We proceed: "The 18th and 19th unsettled—showers at times, with gusts of wind. The air colder as the sun draws near the aspect of Saturn. The 22d cold, with rain and heavy atmosphere."

*Mr. Macrone.*—In our last we noticed the deaths of two publishers of eminence, and have now to record the decease of Mr. Macrone, another enterprising individual of the same class, at the early age of twenty-eight. Mr. Macrone's health had rapidly declined during the last few months, and a fine-looking and apparently healthy man, was thus prematurely hurried to the grave.

*Vauxhall* has closed its ballooning season, and, if it has not been a monstrous profitable one, it has not been the fault of the monster balloon. Shakespeare tells us that the air has its bubbles, and this is the biggest bubble of them all.

*Hurricane in the West Indies.*—Another dreadful hurricane has devastated Barbadoes and other West India islands. For several days after the 26th of July, the wreck of vessels and the destruction of life and property on shore, have been appalling.

*Tempests.*—Among the violent storms which have this season visited various parts of the continent, late accounts from Moldavia and Wallachia state that a frightful tempest had ravaged these provinces. In Wallachia, a train

of sixty-four carts of salt had been swallowed up, and a hundred persons destroyed.

*The Thames Tunnel.*—It gives us pleasure to hear, that the breach lately made in the tunnel has been closed, that the water has been expelled, that it appears the shield has suffered no injury, and that there is every prospect of the works being speedily resumed.

*Conservatory.*—An immense conservatory, which, when completed, will be the largest in the world, is at present in progress, under the direction of Mr. Decimus Burton, at Chatsworth, the seat of the Duke of Devonshire.

*The Duke of Wellington.*—The subscription for the "National Memorial" to our illustrious hero, is proceeding with great rapidity, and promises to amount to a sum worthy of the object.

*March of Gentility.*—In front of a hotel in an obscure lane leading to Skinner's Street, Somers Town, a showy board is displayed with the following announcement in large yellow letters,—"Saint Pancras Establishment for cats' meat and dogs' meat."

*Ink.*—It is said that a strong decoction of coffee, is the best material for diluting ink that has become too thick for use.

*The Tea-Plant.*—The tea-plant has, for some years, been cultivated, with great success, in the neighbourhood of Angers, in France.

#### LITERARY NOVELTIES.

Miss Landon's novel, *Ethel Churchill*; or, *The Two Brides*, so long delayed on account of her health, is on the point of publication. The scene is laid in the time of George II.

Thomas Erskine, Esq. Advocate, author of "An Essay on Faith," "The Brazen Serpent," &c. &c., has a new work for the press, which will appear in a few weeks.

In the Press.

The Book of Gems, 1838: the Modern Poets and Artists of Great Britain, edited by S. C. Hall.

#### LIST OF NEW BOOKS.

Questions on the History of Europe; a Sequel to Miss Mangnall's Historical Questions, by Julian Corner, 18mo. 5s.—Words of Wisdom for my Child, 23mo. 2s.—A Pilgrimage by Sea and Land, by J. C. Stahlachmidt, translated from the German, by J. Jackson, 18mo. 6s.—The New Excitement, for 1838, 18mo. 4s. 6d.—The Family at Heatherdale, by Mrs. Mackay, 18mo. 3s. 6d.—A Sketch of English History, by G. M. Gilbert, 12mo. 2s.—Conversations on the Human Frame and the Fine Senses, square 18mo. 2s. 6d.—Peter Parley's Wonders of the Earth, Sea, and Sky, square 10mo. 5s.—Lectures on Entomology, by J. B. Barton, 12mo. 1s.—Gleanings, Historical and Literary, crown 8vo. 10s.—The Lyre; Select Extracts from Poets, by A. and C. T. Gauntlett, 3d edition, 18mo. 4s.—Warran's (E. A.) Botanical Chart for Schools, canvass and roller, 1l. 5s.—Rev. W. Thistlewaite's Expository Sermons on the Pentateuch, Vol. I. 12mo. 6s.—W. Eagle's Act for Commutation of Tithes, 12mo. 6s.—Lord Holt's Judgments on the Privilege of Parliament, royal 8vo. 6s.—Mechanics for Practical Men, by A. Jamieson, LL.D. 8vo. 12s.—The Life and Reign of William the Fourth, by the Rev. G. N. Wright, 9 vols. 8vo. 18s.—The Gods of Homer and Virgil; Mythology for Children, square, 3s.—Life and Memoirs of Hannah More, by Miss Julia Corner, 18mo. 2s. 6d.

James Ridgway and Sons, Piccadilly; and all Booksellers.

13 Great Marlborough Street.  
**M. R. COLBURN**  
has just ready for publication, the following New Works:—

I.  
**Ethel Churchill;**  
Or, the Two Brides.  
A Story of the Reign of George II.  
By Miss London,  
Author of "The Improvisatrice," &c.

II.  
In 3 vols. 8vo. with Portrait,  
**Life of Sir Edward Coke;**  
With Memoirs of his Contemporaries.  
By C. W. Johnson, Esq. Barrister-at-Law.

III.  
In 3 vols. post 8vo.  
**Stories of Spanish Life.**  
Edited by Lieut.-Col. Craufurd, Grenadier Guards.  
Also, just published,  
I.  
In 3 vols. post 8vo.  
**Uncle Horace.**

By Mrs. S. C. Hall,  
Authoress of "Sketches of Irish Character,"  
"The Buncos," &c.  
"These volumes, whether for talent, feeling, or principle, do Mrs. Hall the highest credit. We congratulate our readers on having to make 'Uncle Horace's' acquaintance."—*Lit. Gazette*.

II.  
In 3 vols. post 8vo.  
**Stokeshill Place;**  
Or, the Man of Business.  
By the Authoress of "Mrs. Armitage," "Mothers and Daughters," &c.  
"These volumes contain some of the most exquisite sketches we have yet seen, even from the pen of Mrs. Gore."—*Examiner*.

**SEQUEL TO MANGNALL'S QUESTIONS.**  
On Monday, September 18, will be published, price 5s. bound,  
**QUESTIONS on the HISTORY of EUROPE:** a Sequel to Miss Mangnall's Historical Questions.  
The object of the author is to render the minds of her youthful readers as familiar with the history of the modern nations of Europe as they have been made with that of Greece and Rome by means of Miss Mangnall's Historical Questions.  
London: Longman, Orme, Brown, Green, and Longmans.  
Of whom may be had, with the last Corrections of the Author,  
**Miss Mangnall's Historical Questions. 4s. 6d.**  
**Miss Mangnall's Geography. New edition. 7s. 6d.**

**FIRST COMPLETE EDITION UNIFORM WITH BYRON, SCOTT, CHATFIELD, COWPER, &c.**  
On Monday, October 16, will be published, in fcap. 8vo. with a Portrait of the Author by Lane, and a Vignette by Crewick, beautifully engraved by Finden, price 5s. of cloth, lettered,  
Vol. I. (containing Joan of Arc) of

**SOUTHEY'S POETICAL WORKS;**  
collected by Himself.  
This edition, which the author has arranged and revised with the same care as if it were intended for posthumous publication, will be comprised in ten volumes, including many pieces which have either never before been collected, or have hitherto remained unpublished. Preliminary notices will be affixed to the long poems, the whole of the notes retained, and such additional ones incorporated, as the author, since the first publication, has seen occasion to insert. The frontispiece and vignettes will consist of views appropriate to the respective volumes.  
London: Longman, Orme, Brown, Green, and Longmans.

## BOOKS PUBLISHED THIS DAY.

Price 3s. 6d.  
**MEMORIETTA ITALIANA, per le FANCULLE:** o Conversazioni Familiari in Italiano ed in Francese, precedute da spiegazioni, ed altri dettagli importanti a supplire per poter conversare in Italiano.  
Da MARIA EMILIA A. CASSELLA, di Firenze.

By Richard Bentley, New Burlington Street,  
Publisher in Ordinary to Her Majesty.

I.  
**The Vicar of Wrexhill.**  
By Mrs. Trollope.  
Author of "Domestic Manners of the Americans," "Jonathan Jefferson Whitlaw," &c. 3 vols.

II.  
**MR. IRVING'S NEW ROMANCE.**  
**The Hunters of the Prairie;**  
Or, the Hawk Chief.  
3 vols. 18s.

III.  
**Narrative of the Last Expedition into Central Africa.**

Including a Steam Voyage up the Niger.  
By Macgregor Laird and R. A. K. Oldfield,  
Surviving Officers of the Expedition.  
In 2 vols. 8vo. with Map and numerous Plates.

IV.  
**Kindness in Women;**  
A Novel.  
By T. Haynes Bayly, Esq. 3 vols.

V.  
**The Bivouac;**  
Or, Stories of the Peninsular War.  
By W. H. Maxwell, Esq.  
Author of "Stories of Waterloo," &c. 3 vols.  
Also, just ready,  
VI.  
**Italy.**

By J. Fenimore Cooper, Esq.  
Author of "The Pilot," "The Last of the Mohicans," &c. 3 vols.

VII.  
**The Old Commodore.**  
By the Author of "Rattlin the Reefer," &c. 3 vols.

**SCHOOL and COLLEGE GREEK CLASSICS.**  
With English Explanatory Notes, Examination Questions, &c.  
**A J A X of SOPHOCLES.**  
By the Rev. F. VALPY.  
Small 8vo. 5s. boards. On the same Plan,  
**Edipus Rex, Edipus Coloneus, Antigone, and Trachiniae.** By the Rev. J. Brasse, D.D. late Fellow of Trin. Coll. Camb. 5s. each, separately.  
**Philoctetes of Sophocles.** By G. Burgess, M.A. Trin. Coll. Camb. 12mo. 5s.

These last Five Plays of Sophocles may be had in 1 vol. cloth, 12s.

**Eschylus. Prometheus.** By the same. 5s. 2d edition.

**Euripides. Hecuba, Medea, Phœnix, and Orestes.** By the Rev. J. R. Major, Head Master of King's College School, London. 5s. each, separately.  
These Four Plays may be had in 1 vol. cloth, 12s.

**Thucydides. A new Recension of the Text,** and an Amended Punctuation. By the Rev. S. T. Bloomfield, D.D. 3 vols. small 8vo. 7s.

**Herodotus. Containing the History alone of the Persian Wars.** By the Rev. C. W. Stoecker, D.D. Vice-Principal of St. Alban's Hall, Oxford. 3 vols. 12s.

**Xenophon. Anabasis.** By F. C. Belfour, M.A. 2d edition, 8s. 6d.

**Xenophon. Cyropædia.** By E. H. Barker. 2s. 6d.

**Demosthenes. Philippica I.; Olynthiaca, I. II. III.; de Pace; Eschines c. Demosthenem; Demosthenes de Corona.** By the same. 8s. 6d.

**Plato. Four Dialogues: the Crito, Greater Hippias, Second Alcibiades, and Sympyus.** By G. Burgess, A.M. 9s. 6d.

Printed by A. J. Valpy, Red Lion Court, Fleet Street; and sold by all Booksellers.

#### THE BRITISH ASSOCIATION. SEVENTH MEETING: LIVERPOOL.

[Second notice.]

WAITING at the close of the meeting (though still within its vortex), we are better enabled to look at its general features and effects; to consider the circumstances of the anniversary altogether, and to glance towards the future, with the expectations that may be formed of the progress of this rapidly increasing, and now nationally important institution.

The number of members enrolled at Liverpool has been 1840; the sum of money contributed to the funds (with some deduction for expenses at this meeting), 2633*l*. Thus, there are large elements in the lower or financial strata for producing results of great value to science; and when we see these elements directed by such men as are at the head of the Association, in each of its Sections, it is impossible not to anticipate growing powers, and yet more beneficial consequences. Superior organisation, the fruits of experience, must contribute to the *desiderata* hereafter to be hoped for; and improvements in those respects where there have been defects,—defects and imperfections inseparable from the earlier periods of any great design.

With regard to the reception given to the meeting at Liverpool, we may repeat, that to the very close, it augmented in sumptuous hospitality and friendly kindness. Every one seemed to vie with his neighbour in paying to visitors all the courteous attentions for which the occasion afforded an opportunity: private accommodations and entertainments abounded, and the public assemblages were provided with a superfluity of luxuries, lavished with an unsparing hand. At the last ordinary on Saturday, we hear the dinner went off with an *éclat* beyond even the appointed "field-days" of Monday and Wednesday.

The proceedings of the Sections have also been, on the whole, satisfactory. We trust there is no one who entertains so mistaken a notion of these anniversaries, as to suppose that any wonderful discoveries in science will or can be promulgated at them. Their advantages are of a different, but, perhaps, not less important character. They are calculated to diffuse a more universal love for scientific pursuits, to soften asperities, and cultivate good feelings, and to stimulate new minds to enter into the arduous, and, if successful, honour-crowned race. They pretty accurately mark the advance of science up to their own date; and if they do not *add* much to the building, they must unquestionably *suggest* additions, and (what is in our opinion equally useful), they knock down past blunders in the superstructure, and clear away a vast quantity of the fanciful projects and rubbish which encumber and prevent improvement. Knowledge is as much promoted by the dissipation of Error as by the establishment of Truth.

We proceed, in continuation of our last *Gazette*, to some of the details. In SECTION A, the papers appointed for TUESDAY were,—

1. Dr. Robertson—Report on Nutations.
2. Mr. Russell—Report on Waves.
3. Mr. Blackburne—On Geometrical Theorems:

4. Professor Powell—On Absorption of Light.
5. Sir W. R. Hamilton—On Abel's Theorem.
6. Mr. Henwood—On Temperatures of Slate and Granite.

Of many of the proceedings of this Section, it is (as we have already stated) impossible to give any report that would be generally intelligible. Accurate diagrams, and figures to a great extent (not ridiculous and partial pretences), are requisite to illustrate the demonstrations; and, after all, perhaps, in some instances,

"Where ignorance is bliss,  
'Tis folly to be wise."

Dr. Robertson's 'Report on Nutation' complimented Bradley on the astronomical calculations he had established a hundred years ago, and explained the subsequent improvements to the present time. Elaborate calculations on the aberrations in the relative motions of stars, and a statement of the accuracy of the observations on sidereal disturbances, with comparisons founded upon them, were the principal points in this paper. Mr. Baily noticed how closely Dr. Robertson's views were confirmed by the previous labours of Bradley, with which they so entirely agreed.

Mr. Russell read his 'Report on the Waves'—a continuation of the subject and experiments mentioned in our last, which we reserve for a future Number.

Mr. Blackburne's paper 'On Geometrical Theorems' was the next communication; and Professor Powell proceeded to the consideration of the Absorption of Light, and particularly the capricious phenomena exhibited in the absorption of the rays. Various theories had been advanced to account for these phenomena. Amongst others, that of Von Redi, which supposed that different rays might be retarded in their passage through certain media, and come out superposed upon other rays, and thus form complex rays. This theory appeared to Professor Powell highly satisfactory: the only defect to be supplied in it was some numerical law for the facts. The chairman, however, held the theory of Von Redi to be quite untenable; and Professor Lloyd agreed in this opinion.

Sir W. R. Hamilton read a paper 'On the Possibility of resolving Equations of the Fifth Degree.' He took the theory of Abel as a text in discussing the subject; which, though not altogether satisfactory, had not been proved to be an impossible mode of solution.

Mr. Henwood presented to the Section the results of a long-continued and extensive series of observations, 'On the Lower Temperature which prevails in the Granite than in the Slate of Cornwall.' The experiments were made in running streams of water immediately on their issuing from the unbroken rock; a mode which he considers less liable to objection than when made on the air, standing pools of water, or in the rock: the former being affected by the presence of workmen and their lights; the second and last by the temperature of the air and by evaporation from their surfaces. The difference at all depths he finds to be about 3° 9'. It also appears that the elevation of temperature taking place in descending is one degree for every 6·5 fathoms in slate, and for every 6·9 fathoms in granite. The experiments from

which these deductions are drawn were about 150 in number.

#### SECTION B.

Mr. J. J. Griffin opened the business by exhibiting and explaining many Specimens of Chemical Apparatus which he had constructed. The models seemed to be held up as if for sale, and we thought the time spent in describing them much thrown away, though Mr. Faraday kindly complimented Mr. Griffin on their cheapness, ingenuity, and utility.

A discussion ensued upon Mr. Golding Bird's paper 'On the Crystallisation of Metals, by Voltaic Action,' hurriedly read yesterday, which incidentally brought up the subject of Mr. Crosse's experiments. The chairman, Dr. Faraday, observed that it was one of intense interest, as they all must remember the excitement which prevailed at the last meeting of the Association, on discovering that artificial crystals could be produced by means which were previously supposed only to be active agents in the mechanism of the earth. The experiments of M. Becquerel, Mr. Crosse, and Mr. Fox, were of the greatest importance to science; but all that they had been able to state of the mineral veins which were found in the earth was, that they were, in all probability, formed by chemical or electrical currents. The difficulty had been to understand how a current running round the earth should cause the crystals to be deposited in particular and very limited places, the currents themselves being general. It came to this,—that supposing they sent a current round in a certain direction, and brought it to a given situation in the earth, they should find crystals where the current made the juncture. This was as far as the experiments of the above-named gentleman went. Mr. Bird said that he obtained crystals not only at the extremities of the current, but in the interval between; and it was of the utmost consequence to ascertain whether such were really the case.

Mr. Golding Bird said it had been long considered, and the experiments of Mr. Fox had proved it, that electric currents fermented the earth in a variety of veins; but it was difficult to understand how metals had been deposited in veins where none had previously existed. It was supposed that metals were formed at the termination of veins already in existence, but they had to look to the first formation of those veins. He was not presumptuous enough to suppose that his experiments were conclusive on that point, but they would perhaps throw some light upon it, and add another fact to the experiments published by Dr. Faraday in the "Philosophical Transactions." The experiments were simple, and succeeded so uniformly, that any gentleman might try them with a certainty of success. Mr. Bird then exhibited specimens of the copper he had produced by means of voltaic agency, and proceeded to detail other experiments which he had made in connexion with the formation and crystallisation of the protoxide and carbonate of copper. The oxide had been previously obtained by M. Becquerel, by means of a tedious process, but Mr. Bird obtained it in a very perfect crystal by the following arrangement:—A piece of glass tube, four inches in length, was closed at one end,

by means of a plug of plaster of Paris, and immersed in a glass cylinder, filled with a solution of copper, the tube being filled with a solution of potash: on immersing an arc formed of zinc and copper into the fluids in such a manner that the zinc leg of the arc may dip into the alkaline solution, whilst the copper may dip into the solution of that metal contained in the exterior cylinder. Under these circumstances an exceedingly weak electric current is developed, not, however, sufficiently energetic to reduce all the copper present in solution to the metallic state, but of sufficient intensity to cause the decomposition of the perisalt of copper, and its reduction to the state of protoxide crystals, which, after a few days, became deposited on the plate of copper which served for the negative electrode. These crystals resembled so closely the native forms of oxide of copper, the ruby copper of miners, that they could scarcely be distinguished from them by the most experienced eye. Some specimens of the kind exhibited by Mr. Bird, vied in transparency with the native ruby.

Dr. Faraday stated, in addition to Mr. Bird's explanation, that the great point which he insisted upon was, the importance of getting a first action out of contact with the electrode. When a portion of copper was first deposited, the action would go on increasing. It was not the growth of the crystal when once formed, but the striking circumstance of the origination of the atom out of contact with the extremities of the electrodes. At the same time chemists were very cautious men. He had no doubt that Mr. Bird would try to find out whether copper, in some shape, might not have been accidentally mingled with the plaster of Paris, and so began the operation.

Mr. Bird replied that he had made experiments at least fifty times, in a variety of methods; he had used surgeon's lint over bladder, as well as common pipeclay, with the same results.

Dr. Faraday was jealous, for the honour of his section, that there should be no mistake; heat might decompose copper. If the crystals formed otherwise than by the current, there was an end of the discovery—otherwise it was very great.

Some farther conversation ensued, which the chairman concluded by observing, that if it were possible to demonstrate the fact by any tangible experiment, that crystals can originate independent of the extremities of the current, there being no nucleus formed, such proof would be opening the door to a very large addition to chemical science.\*

Dr. Faraday then called upon Mr. John B. Hartley to read his paper 'On Preventing the Corrosion of Cast and Wrought-Iron in Salt Water.' When they considered the manner in which cast and wrought-iron was introduced into the construction of vessels, as was the case at this port to a great extent, it would be highly important to hear any means by which it could be rendered capable of resisting the corrosive action which it sustained from salt water.

Mr. Hartley stated, that upon clearing away the soil from Jackson's Dam, in the port of Liverpool, an iron sluice was discovered, which had been immersed in salt water for the space of twenty-five years. Upon taking it up it was found incrustated with barnacles, shells, and sea-weed. Some of the iron was in an excellent state of preservation, whilst the rest of it was entirely decomposed. The lid of the sluice was fastened by means of a brass bolt, two and a-half inches in diameter. In connexion with this pin it was that the iron was in a preserved state. By some inadvertence all the iron-work was broken up and taken to the foundry. In 1825, another valve was taken up, which had been in the water the same time. The top joint of the valve was similar to the one previously found, having an iron pin working in a brass socket, which was again enclosed in an iron case. All the iron in connexion with the brass was in excellent preservation, whilst that removed from it was corroded. Mr. Hartley exhibited part of an iron chain, which had been so corroded in eighteen months as to be quite useless, as well as a piece of iron from the keel of the John Bull, which had been in the water nearly twenty years: it was as light as a piece of fir, and could be cut with a knife like plumbago. In consequence of this discovery, all the iron-work employed beneath the level of the tide at dock-gates, &c. had been placed in connexion with brass, either by having brass plugs fastened into it, or by being somehow worked up with it, and the result had been the preservation of the iron. A long discussion took place upon this subject, which concluded in the acknowledgment that the iron, where conjoined with copper, was preserved from corrosion by that juxtaposition of the metals.

Dr. Andrews then read his paper 'On some singular Modification of the ordinary Action of Nitric Acid on certain metals;' shewing that, by introducing a piece of platina wire in connexion with the metal whilst it was violently acted upon by nitric acid, the action of this acid almost entirely ceased, but that the metal, in most instances, changed colour. This he accounted for by supposing that the platina caused a current of nitrous acid gas to play round the metal, and by this means preserved it from the action of the acid.

Dr. Faraday said, it was most useful to science to shew how metals could be saved from oxidation. It might have been the same influence which had been incidental in protecting the cast-iron from the action of the sea-water. It was a great thing to see a substance like iron, which Englishmen might be said to live upon, liable as it was to the corrosive action of sea-water, or nitric acid, protected from their influence by being brought into contact with other substances. They were much obliged to Dr. Andrews for drawing their attention to the subject. It was in this way, by observing causes, that they were enabled to get at laws.

#### SECTION C.—Papers on the List.

1. Mr. H. E. Strickland—On the Formations of Gravel.
2. Mr. R. Mallet—On the Mechanism of the Motion of Glaciers.
3. Marquis Spinetta—Stratification of Deserts between Suex and Algiers.
4. Mr. Horner—A notice from Mr. Lyall respecting Christiansa.
5. Dr. Traill—On the Geology of Spain.

Professor Sedgwick, in the chair, before proceeding with the business of the day, read two invitations, one from Lord F. Egerton, in the Bridgewater Office at Manchester, inviting the Association to visit the tunnels of the collieries near Worsley; and the other from Mr. Frith,

inviting a party, of not more than thirty, to visit the salt mines at Northwich.

A considerable party of members went to the salt mines, and were, both scientifically and gastronomically, splendidly entertained.\* Many hundred lights illuminated these vast works, and a sumptuous collation was spread for their refreshment. The day was, however, exceedingly unfavourable.

We are not aware whether an excursion was made to the collieries; but on other days parties were highly gratified by visits to Lord Derby's extensive zoological collections; as were others by the inspection of Mr. Laird's iron vessel, now building, the Zoological Gardens of Liverpool, and other places of interest in the town and neighbourhood.

Mr. Strickland's paper 'On the Formation of Gravel' was not only in itself important to geologists, but, in the discussion which followed, it raised the whole question of the silurian system, and the greywacke formations in Wales and North Devon. He considered that the various kinds of gravel ought to be divided into classes. Some were stratified, as if by the action of waves; others, thrown together or deposited in heterogeneous masses, as if borne down by rivers. Some contained mammalia, and other organic and marine remains, of which others were destitute. He also endeavoured to distinguish beds which were mixed with flints, from beds in which no flints occurred. On these grounds, he contended that two periods must be assigned to these formations, viz. that of marine drift, and that of fluvial deposits. The district between the Mersey and Avon, bordered on the one side by the rocks of Hereford and the mountains of Wales, and on the other by the oolite formation of the midland counties, formed the most important part of this formation in England. It appeared probable that there might have been a current running north and south between those rivers, either like the Pentland Firth of Scotland, or, perhaps, of a more violent description. There existed no data to determine the regular age of the gravel, but the deposition of the marine had evidently taken place when England was below the level of the sea, and the fluvial was caused by the action of rivers and lakes now no longer existing. He believed that Cheshire, Staffordshire, and Worcestershire, being very low, had, at some period, admitted the sea into the interior; and that those parts of England had been submerged, marine shells being common in the gravel. His general conclusions were, first, that great beds of erratic gravel, found in various parts, were produced by a northerly current passing over many counties, which lay under the sea, and in which no terrestrial fossils or remains are found; and that the bones of mammalia, &c. found in deposits of rivers and lakes, when England became dry land, formed the second. After enumerating several specialities, Mr. Strickland concluded by recommending the subject as one worthy of further investigation, being attended with the highest interest to geologists.

Sir Philip Egerton remarked, that the remains of mammalia had been found on the plain of Cheshire. In the progress of cutting for the Grand Junction Railway, two grinders of the elephant had been discovered in a bed of gravel replete with marine shells.

Professor Phillips acknowledged the highly interesting nature of the subject, and remarked that it would be a desirable object if the gravel could be traced to its origin. The distinction

\* Another party is engaged for Tuesday the 19th.

\* Bearing on this interesting question, Dr. Faraday was not, perhaps, aware of Mr. Fox's remarkable experiment, stated in the Cornwall Polytechnic Report, which seems strongly to corroborate Mr. Bird's opinions. Mr. Fox tells us, that on immersing a bladder containing acidulated water and zinc in a solution of sulphate of copper, the copper was deposited in a pure state on the surface of the bladder. Hence it appears that the sulphate of copper must have acted as an electric pole, and been electro-negative with respect to the zinc from which it was separated by the bladder. We have heard also, that Mr. Croese has subsequently observed silver deposited on the outside of an unglazed vessel, the zinc being in the inside, and the other metallic pole on the outside, which would confirm the dislocation of the poles.

pointed out by Mr. Strickland with regard to the nature of the deposits (fresh or salt water) was highly important. It was probable that in former times the district between the Mersey and Bristol Channel was covered by the ocean.

After some observations made by Captain Denham, Mr. Smith, of Jordanhall, Mr. de la Beche, and other members,—

Professor Sedgwick bore testimony to the highly important nature of the subject to geologists. Innumerable facts must be collected before a probable theory could be advanced, but the observations which had been made tended greatly to confirm the doctrine of elevation. He believed Wales was of very recent formation, perhaps of only a few thousand years; the configuration of its mountains evidently shewing that the fissures and openings were not caused by the ordinary action of running water, or of any operation now going on, but must have been produced by an upheaving process at a late geological era. The filling up of the lakes, the alteration of the form of the mountains and valleys, by the degrading process now in action, could not have been of long continuance; and he was quite convinced, from personal observation, that the surface could not have been long subject to the present external influences: on the contrary, the phenomena of the boulder stones, traced in every radiation southward from Cumberland, proved that part of the island to have been the older land.

At the close of a discussion of two hours, and of extreme interest, we do not know whether the decision was that Wales, or the North of England, emerged first from the bottom of the ocean; or whether certain deposits were made when the Atlantic was a vast continent, and Britain, perhaps, one sea. The meeting seemed to be carried by the eloquently expressed opinions of the learned professor.

The next paper read was by Mr. Mallet, 'On the Motion of the Glaciers,' attributed to the mechanical pressure of the atmosphere, in which we discovered little or nothing of novelty.

The Marquis Spinetta also read a paper 'On the Sinking of some Wells between Suez and Cairo,' which requires no detailed notice.

Professor Sedgwick, whilst the following paper was getting ready, begged to call the attention of the gentlemen present to some beautiful specimens of Limestone Formation, belonging to Mr. Gilbertson.

Mr. Horner next read a notice from Mr. Lyell, on the fact of a bed of true granite in Norway, lying on a strata of limestone containing organic remains. Professor Sedgwick remarked, that twenty years ago they might have been surprised at the present circumstance, but as it was well known that granite was of igneous formation, he firmly believed the thing was possible, but that the granite must have been driven into its present state when in a state of fluidity intensely heated.

Dr. Traill next treated on the geology of Spain. Mentioning Montserrat, he said that it was not an isolated mountain, as generally supposed, but the last of a mountain chain extending to the Pyrenees;—that the upper part of the mountain was composed of conglomerate, and this rested on clay slate. He likewise noticed, that in those parts of Spain wherever water was plentiful, there the peasants were most industrious. Speaking of the salt mines at Cordova, he said that the salt was so pure, that it had only to be ground in mills similar to our corn-mills before it was fit for use: that the salt, as was generally supposed, was not formed into a rock, but lay in a valley, which

extended three leagues in circumference; that the vast precipice of salt was 400 feet in height, standing on a floor of salt. It was a royal monopoly, guarded by the military; that once, from his ignorance of the Catalanian language, a sentry had levelled his piece at his breast, and was on the point of taking his life, no one being permitted to approach the place unless under the guidance of a miner. He supposed that the quantity of salt was so great as to furnish Spain for several ages. In several places the salt is channelled by water; the edges of these channels are extremely sharp, which proves the extreme dryness of the climate, no moisture being found in the salt.

#### SECTION D.—List of Subjects.

1. Mr. Macleay—A letter from Captain Ducane On the subject of the Metamorphoses of Species of Crustacea allied to *Palæmon*.
2. Mr. Babington—Notice and Results of a Botanical Excursion to Guernsey and Jersey.
3. Dr. Allis—On the Sclerotic Bones of Birds and Reptiles.
4. Rev. J. Reads—On the Chemical Composition of Vegetable Membrane and Fibre.
5. Rev. F. W. Hope—Remarks on the genus *Filaria*.
6. Mr. Bowman—On the Internal Anatomy of the Palm Tribe.
7. Mr. Niven—On Vegetable Physiology.

Mr. Macleay read a very curious letter from Captain Ducane, 'On the Metamorphoses of certain Species of Crustaceous Animals allied to the *Palæmons*, or Prawns and Shrimps.' According to these, the ova of prawns produced minute diaphanous creatures, quite different from the parent prawn. They lived only two or three days. Mr. Macleay thought these phenomena might be referred to different stages of development; Dr. Richardson supposed it possible that some parasitic animal might have intruded itself, and been mistaken for the offspring of the prawn; and Mr. Hope thought the animal (found as it was in brackish ditch-water) belonged to the shrimp, and not to the prawn family, as was the case in similar localities in Norfolk and Suffolk. A grant, it will be seen, has since been made to pursue these curious inquiries; and, perhaps, it may turn out after all, that

*Fleas are lobsters! &—a their souls!*

Mr. Haliday exhibited a figure of the *Argas Persicus*, the poisonous insect which excited some discussion at the meeting yesterday. It appeared that these were of two different species, the *axodes* and *argos*, each of which have a serrated proboscis, the teeth being turned outside. The *axodes* are very common in the West Indies, and in Mexico they are considered quite a pest, as they no sooner make their appearance than the clothes of every individual are covered with them. The President also stated, that in Cuba he had seen the hides of oxen so closely covered with them, that no part of the hide was to be seen. The insect often falls to the ground by the rostrum breaking off from the mouth, when a remarkable phenomenon is exhibited. They eject from the mouth in this condition some thousands of eggs, until the skin is empty, and all the inside appears to have been voided.

Mr. Bowman read some remarks from Mr. Gardner, on Vegetable Physiology, illustrative of an extensive series of experiments on the Wood of Palms.

Mr. Gray described several rare and interesting mammalia, which were the property of the Royal Institution of Liverpool. The first he noticed was a Sea-Otter from the Brazils, and also inhabiting several parts of the Pacific Ocean, which differed much from the ordinary otter of our rivers, in the much more largely developed feet. No specimen of the kind was

contained in the museums of London, Paris, Berlin, or, indeed, any part of the continent. There was, also, a curious animal from New South Wales, extremely rare in the collections of this country, and of the genus *Phyllosaures*, having teeth like seals. There were, also, although not new to science, two antelopes from the western coast of Africa, which were little known in this country. He likewise described the *Lelis gracilis* from India, which was first delineated by Dr. Horsfield, from the collection made by General Hardwicke; as, also, a gigantic seal, which had only been known before by description. These were circumstances which must necessarily lead to the appreciation of such local exhibitions, containing, as they did very frequently, such objects of rare and novel interest. He was happy to observe, that the increased facilities afforded to the public for viewing this, as well as other public exhibitions, was not productive of the slightest injury to the specimens.

In a conversation which ensued, high compliments were paid to the Museum of the Institution; and it was noticed to be well worthy of being better known than it seemed yet to be to the inhabitants of Liverpool. Mr. Allis's paper, 'On the Sclerotic Bones of various Birds and Reptiles,' was one of much value to comparative anatomy. He referred to the works of many of the most celebrated naturalists on the subject, and, exhibiting the bones of eagles, vultures, owls, hens, pigeons, &c. &c., as well as of many reptiles, pointed out their uses for the defences of the eye, and other purposes admirably adapted to their habits.

Mr. Read's paper, 'On Vegetable Membrane and Fibre,' was a chemical investigation of equal interest; and the analysis of several plants led to rather novel conclusions regarding the produce of nitrogen, and the difference between fibre and membrane.

Mr. Henslow thought the writer mistaken upon the latter point.

Mr. Hope read a paper, 'On a Genus of Parasite Worms, named *Filaria*, which infested Human Beings as well as Insects.'

Mr. Nevan detailed some very interesting experiments, illustrated by specimens, on the Effects of Cutting the Bark off Elm Trees, in rings of six or eight inches in breadth. In some cases the upper rim of the bark had shot out roots; whilst, from the lower part of the section, twigs and branches shot up. From these he concluded that the life of trees does not depend on the bark; that the sap descends before leaves are developed; and that new substance ascends from the root. Mr. Lindley doubted the latter part; but the experiments generally confirmed Du Petit Thouar's theory on the structure of wood.

#### SECTION E. The papers on the lists were—

1. Dr. G. C. Holland—Cause of Death from a Blow on the Stomach, with remarks on the means calculated to restore animation suspended by such accident.
2. Dr. H. Carille—On the Formation of the Sacrum in Man, and some of the Lower Animals.
3. Dr. John Reid—On the Functions of the Eighth Pair of Nerves—Experimental Inquiry.
4. Dr. J. Black—Account of the late Influenza at Bolton, January, February, and March, 1837.

Dr. Holland, after discussing various opinions on the cause of death from a blow on the stomach, explained his theory to be, that the blow was generally given from below upwards; the blood was thereby forced back on the left ventricle, when, compressed by the shock, death ensued. The best remedy, when insensibility was produced by injury to the heart, was galvanism. Galvanism applied to the heart, when its action had ceased, might cause its contraction. No method was so likely to restore ani-

mation as inflation of the lungs by artificial means, and galvanism applied to the heart, which might restore its wonted action. In all such cases exertions should be made to restore animation, as the symptoms appeared to be those exhibited by drowned persons, who were frequently restored to animation; and life was not lightly to be sacrificed.

Dr. Copland, and Dr. James Johnston of London, Mr. James Murray, and Dr. Williams, doubted the accuracy of Dr. Holland's conclusions; and he replied to their arguments. The other three papers were then read, and the Section adjourned.

#### SECTION F.

All the papers of this day related to Education, and as follows:

1. Mr. W. R. Gregg—Report on the State of Education in York.
2. Mr. Morrill—Remarks on the "Report on Education in Liverpool."
3. Mr. W. Tate—Remarks on the "Report on Education in Liverpool."
4. Rev. Francis de Soyres—Account of the Educational Statistics of Siddleham, in Sussex.

The data collected by these gentlemen are no doubt of great importance, but they are also in great detail, and so extensive, that their application to any useful purpose, as they could be reported in a limited periodical, would be impossible.

The same topic has also been largely treated of at other meetings, here and elsewhere, during the week, under the zealous exertions of Mr. Wyse. Central societies of education have formed, and met in considerable numbers; and publications are to emanate from these sources, fully explanatory of their data and their views. We will, therefore, content ourselves with classing together a few of the most striking statements which have occurred to us. In 1836 the population of York was estimated at 28,000, of whom 7000, or one-fourth, were calculated to be between the ages of 5 and 15; and of these, 4700, or 67 per cent, were under a course of nominal instruction in the day and Sunday schools, and 2300, or 33 per cent, were under no course of instruction at all.

In Liverpool, of the whole population of the parliamentary borough in 1835-6, estimated at 230,000, one-fourth, or 57,500, consisted of persons between the ages of 5 and 15, who ought to be under some course of instruction; 31,300 attended no schools whatever. Mr. Merritt entered into several statements, for the purpose of shewing that the proportion of persons between the ages mentioned was one-sixth or one-seventh only, and not one-fourth of the whole; that the number of children to whom education should be furnished, according to this rule, was only 36,516, instead of 57,500, leaving a deficiency of only 9400 without instruction; and from this number he made a deduction on account of children educated elsewhere, leaving the total 8500 only. As to the quality of the instruction furnished, the report gave some disgusting details, and presented a very degraded picture, presenting what he believed to be the exception only, as the rule. There was, however, quite enough of truth in the report to fill the mind of every sensible inhabitant with regret, and he admitted that much had been done since the examination to remove the evil complained of.

Mr. Tate still more severely impugned the Manchester report, and defended Liverpool from the charges it contained. He concluded, It remains, then, with the public to judge whether the society, in their "painful and humiliating conclusions," have conveyed a correct idea of the state of education in this town; or whether, rather, in their excessive zeal for

the cause of scholastic reform, and also in their belief that it can be effected in no other manner than by the active agency of the government, they have not indelicately laboured to stamp the impression of "hopeless insignificance" on "the efforts of private benevolence" throughout this country, and that of utter worthlessness on the exertions of conscientious assiduity on behalf of the rising generation of Liverpool.

Colonel Sykes suggested the propriety of establishing a statistical society in Liverpool.

Lord Sandon thought that Liverpool possessed peculiar facilities for the attainment of statistical information from all parts of the world, and he should be exceedingly happy if what had passed that morning should lead to the foundation of such a society. Liverpool might thus become a great centre and focus of light to the whole country. With respect to education, there was no town with which he was at all acquainted, in which there was not great room for improvement, both in the quantity and quality of education. As the Manchester Statistical Society had made it an attack of inferences and inductions, Mr. Tate should have been allowed more latitude in reply than to have his statements confined to mere figures, especially as there were so many conclusions in the report, which were thus left unanswered.

Mr. M. Martin, author of "The History of the British Colonies," stated, that when preparing his history, he came down to Liverpool, and got more information here connected with the colonies than he could obtain in many of the colonies themselves. He had also got better information respecting London, in Liverpool, than he could get in London itself.

Lord Sandon said he had never known a good object to languish in Liverpool for want of funds.

In regard to Sussex, the result was, that out of a population of 1002, 231 children were receiving some sort of education.

#### SECTION G.

Mr. Hawkins's bust by machinery.—See last *Gazette*.

Mr. Fairbairn communicated 'On the Result of his Experiments on Hot and Cold Blasts in the Smelting of Iron.' At the request of the Association, he and his colleague had made a series of experiments on the relative strength of hot and cold blast-iron. The investigation had been conducted with much care, and after a great variety of methods. They had varied the form of the metal, and had subjected it to every description of strain. Casts of four feet six inches long, and one square inch in thickness, had been subjected to a strain from weights. Wishing to ascertain whether the iron, having given way to the pressure, only required time to break, they found that one bar of hot blast broke in fifty-seven days, with a pressure of 448 lbs. The first iron which they experimented upon was from the Carron works, hot and cold blast. They found that the Carron cold blasts broke with a pressure of from 394 lbs. to 484 lbs., which gave a mean of 439 lbs. The hot blasts 407.4 to 402.1, which gave a mean of 404.7. Their next experiment was with the cast, 1½ inch in thickness, but with the bar planed down to an inch. The object was to try if the skin or outward surface offered any material resistance. The result was, with the hot blast, 478.6 to 429.3,—mean, 452.3. With the cold blast, 448.6 to 456.6,—mean, 452.6. The next experiments were made on bars cast in the form annexed. They first broke it with the flange upwards, and then downwards. With the flange up-

wards, it took a weight of 1050 lbs. before it broke, and there was a considerable deflexion. The ratio was 933.3. When they reversed it, with the flange downwards, and with the same distance between the supporters, it broke with 266 lbs. This was with the cold blast. With the hot blast, 980 and 280. It appeared, from this experiment, that they should be particular as to the form and position of beams. The next experiment was upon castings of a triangular form. From the whole figure the apex broke with a pressure of 980 on the hot blast, 952 on the cold blast. When the apex was off, the frustrum broke with a pressure of 812 hot blast; 742 cold blast: ratio of strength, 913.8. The next experiment was on rectangular bars, one inch thick and three inches long. The result was, that it took 3750 lbs. to break the hot blast, and 3843 the cold blast. Mr. Fairbairn went on to detail his experiments on the different sorts of iron which he had received from Scotland, Wales, Staffordshire, &c. He had, likewise, tested iron at various degrees of temperature, from the freezing point up to a red heat. Welsh iron, at the freezing point, broke at a pressure of 949.6 lbs., at a slightly red heat at 723 lbs. The relation, however, from the result of these experiments was 1000 to 1039 in favour of the hot blast. Cast-iron, when exposed to increased temperature, loses a considerable portion of its strength, and its deflexions are also considerable. A series of interesting experiments had been tried, also, with a view to observing the nature and extent of deflexion in cast-iron. Bars, four feet six inches in length were used, loaded with a weight of 392 lbs. The deflexion was found to be 1786 in the cold blast, 1891 in the hot blast. The breaking weight had been 488 lbs. in the cold blast, in 108 days,—one bar, however, having broken at 35 days. A great number of questions were asked by various individuals in the room, most of them connected with the iron trade; and, as we have remarked, a very strong interest was manifested on this subject. Mr. Fairbairn's results seemed ultimately to refer themselves to the original qualities of the iron, one kind being stronger when smelted by the hot blast, and another when manufactured from the cold. Dr. Thomson's report on the same subject, in the Chemical Section, on Thursday, confirmed these opinions; and it will be seen from the proceedings of the General Committee, that the question was not considered to be settled, since a farther sum was voted to continue and multiply the experiments.

Mr. Ettrick described an artificial horizon which he had invented for the purpose of taking observations at sea, when the natural horizon was obscured, but the heavenly bodies visible.

Professor Henry presented the Section with a set of maps of the canals, railroads, &c. of the United States. In these States, he said, there were about 2000 miles of canal, and 1500 miles of railway. About 3000 miles more of railway were in progress, but had been partially suspended in consequence of the recent commercial embarrassments. Some questions were put relative to the speed of steam-vessels in America. The professor said he was a professor of physics, and not a practical engineer; but he had himself gone on the Hudson at the rate of fifteen miles per hour.

Dr. Lardner entered into an elucidation of the question of the possibility of steam intercourse between this country and India and America, against the practicability of the former of which the doctor declares himself. He supported his reasoning during this and the ensuing

meeting, by the comparison of the logs of government vessels and other data, which provoked a warm debate, in which his facts were impugned, his references challenged, as belonging to notoriously an inferior class of steamers, and himself almost abused by some of his opponents. As the question, however, was left *sub judice*, we shall not enter upon any report of the discussion.

In the evening a gay and crowded *soirée* was opened by the Mayor, in the Town-Hall, which kept people alive till near midnight.

#### GENERAL COMMITTEE. SATURDAY.

The minutes of the meeting of Thursday were read and confirmed; and the officers for the ensuing year appointed—viz. the Rev. G. Peacock and R. I. Murchison, Esq., General Secretaries; Treasurer, John Taylor, Esq.; and Assistant-General Secretary, John Phillips, Esq. Some changes were made in the Council which sits permanently in London, and is the organ of administration throughout the year, and conjointly with the General Committee during the meetings.

Mr. Murchison stated that he had received a letter from the Earl of Durham, declining the vice-presidency. His lordship had accepted the presidency at the request of the local authorities, and the *contretemps* mentioned in our last, we presume, led to this refusal of the inferior station. The Bishop of Durham was proposed in his lordship's stead, and elected, after some playful remarks from Professor Sedgwick and the Marquess of Northampton.

It was then agreed that the next meeting should be in August; and it was understood to be the sense of the Committee, that it should take place as early in the month as the Council could appoint consistently with circumstances.

The grants of money recommended by the Committee of Recommendation were brought forward by Mr. Phillips; and, after some discussion on some of them, agreed to as follows:

#### IN SECTION A.

- 500*l.* (renewed) for the Reduction of Observations on Stars 1780-90, from the "Histoire Celeste." Mr. Baily, Mr. Airy, and Professor Robinson.
- 75*l.* For the Continuation of the Discussion of the Tides at Bristol, confided to Mr. Whewell.
- 50*l.* Hourly Observations on Meteorology at Plymouth. Mr. Snow Harris.
- 10*l.* For Repairs of the Anemometer at Plymouth. *Idem.*
- 500*l.* To extend the Catalogue of the Astronomical Society, and Stars in the Northern and Southern Hemispheres, to 1850. Mr. Baily, Airy, and Robinson.
- 100*l.* To continue the Experiments on Waves. Mr. Russell, &c.
- 100*l.* To ascertain the Action of Gases on the Solar Spectrum. Sir D. Brewster.
- 40*l.* For the Construction of an Anemometer on the Plan of Mr. Osler, to be employed in Observations at Plymouth.
- 100*l.* To the Meteorological Committee, to be expended on the Purposes expressed in their Appointment.
- 80*l.* A Renewal for Experiments with Lenses of Rock-salt.

#### SECTION B.

- 20*l.* For Experiments on the Composition of Atmospheric Air. Mr. West of Leeds.
- 30*l.* Chemical Constants. Professor Johnston.
- 20*l.* For a Series of Experiments, on a great scale, on the Effects of Sea and River Water on Cast and Wrought Iron. To be tried at Dublin, &c.
- 10*l.* To Mr. Mallet, to continue Experiments of Heat at 212°, on Organised and Inorganised bodies.

#### SECTION C.

- 272*l.* To ascertain the relative Land and Sea; balance of 500*l.* last year, not expended.†

\* It was mentioned, that government would be solicited for 200*l.*, to co-operate in effecting this great astronomical object.

† Captain Pollock made a complaint of the conduct of the committee in not calling for the assistance of all its members in this inquiry, which was explained by Mr. Whewell.

- 105*l.* To M. Agassiz, to complete the Publication of his Fossil Ichthyology, the 9th and 10th Livraisons of which had appeared, and referred chiefly to Great Britain.

- 50*l.* A Renewal of the Grant for Investigating the Peat Mosses in Ireland.

- 20*l.* The same, for Investigating the Deposit of Mud in Rivers.

447*l.*

#### SECTION D.

- 50*l.* Experiments on the Growth of Plants under Glass, excluded from the air (Mr. Ward's).

- 25*l.* For the Preservation of Animal and Vegetable Substances.

75*l.*

#### SECTION E.

- 50*l.* For the Investigation of the Anatomical Relations of the Absorbent and Venous Systems.

- 25*l.* For the Effects of Poisons on the Animal Economy.

- 25*l.* Chemical Analysis of Animal Secretions.

- 50*l.* London and Dublin Committees to continue Observations on Sounds of the Heart.

- 25*l.* Sub-Committee of the Medical Section to Investigate Diseases of the Lungs in Lower Animals.

- 25*l.* Pathology of the Brain and Nervous System—Liverpool and Manchester.

200*l.*

#### SECTION F.

- 150*l.* For Inquiring into the State of Schools in England.

- 100*l.* Inquiry into the Condition of the Working Population—to be given in Numerical Tables.

450*l.*

#### SECTION G.

- 100*l.* To continue Experiments on the Strength of Cast-Iron, and extended to Wrought-Iron, smelted by Hot and Cold Blasts.

- 50*l.* To ascertain the Duty performed by Pumping Engines in Cornwall.

- 100*l.* To ascertain the Amount of Duty performed by one Bushel of Coals, &c., not in the Cornish Districts.

- 50*l.* Experiments on the Mean Value of Railway Constants.

- 100*l.* Series of Observations on the Average Locomotive Duty of a Ton of Coals; and

- 50*l.* to extend the same to the other side of the Atlantic, if deemed necessary.

450*l.*

The total of grants, 3057*l.*

Mr. Phillips having stated that Reports and Researches recommended by the committee, were the other two matters which now came under consideration, the following were agreed to:—

In A. Mr. Wheatstone, a Report on Vision. Sir W. Hamilton, on his Dynamics applied to the Moon.

In B. Professor Leibig, on the present State of Isomeric bodies; and also on Organic Chemistry and Analysis. Professor Johnston, on Inorganic Chemistry.

In C. Mr. Owen, on the present State of Knowledge of the Fossil Reptiles of Great Britain. On the Effects of Voltaic and Electricity on the production of Crystals.

In D. A continuation of Mr. Hooker's Report. Sir W. Jardine, on Salmonide; Mr. Gould, on Caprimulgi; and Mr. Hope, on Fossil Insects.

RESEARCHES.—To procure tide observations at Liverpool. Astronomical observations, *ibid.* Empirical tables of the moon, and reduce the Greenwich observations.

For these considerable sums and influence are requisite, and Mr. Whewell, Mr. Lubbock, and Dr. Traill, were named a committee to apply to government, and take other measures needful to effect them.

Thanks were given to the Trustees of the Clyde Navigation, for the facilities they had afforded to Mr. Russell; and it was resolved to ask the Dock Committee of Liverpool to allow similar assistance to meteorological observation at the lighthouses, &c.

To invite engineers on railways to collect fossils, and send them to the Geological Society in London, distinguishing the beds in which they were found, &c.

In Botany, a committee to collect materials for a Fauna of Ireland. Mr. Vigors, secretary.

In Zoology, to ascertain the modes by which mollusc excavate rocks. Capt. Ducane, for inquiry into the metamorphoses of crustacea, Southampton.

In Medicine, a committee on the physiology of the lungs and bronchia.

That a record of the proceedings of each Section should be entered on books provided for that purpose.

That Statistical information respecting India should be sought by the examination of records in the India House: the condition of the mining population of Cornwall and Wales; and the state of education in Manchester to be ascertained.

A committee, with Sir D. Brewster at its head, was appointed to get together an exhibition of models, &c. at the next meeting (the design having completely failed this year); and, on the motion of Dr. Granville, some useful regulations for the more convenient reception of members were adopted.

After some other discussions, which led to no results, the meeting adjourned, having been engaged during four hours.

In making up our report of the proceedings of Monday, we deferred several papers, viz. 1. Capt. Denham's 'Observations on the Deposits

of the Mersey,'—a subject of such vital importance to the trade and navigation of Liverpool; 2. A portion of the earlier papers and proceedings in the same Section (C), of Geology; 3. Col. Sykes's Report, in the Statistical Section, 'On the Deccan'; 4. Dr. Taylor's 'Details respecting Education at New York'; and, 5. Dr. Traill's Annual Address in the Amphitheatre. In order to make our *résumé* more complete, we now revert to these subjects.

After its formation, and a brief introduction from Professor Sedgwick, Professor Whewell addressed the Geological Section on the proceedings for ascertaining the relative levels of land and sea; or, rather, for establishing data by which to test their future alterations. He was sorry that the report which he had to make was neither complete nor long. Large surfaces of land, it was well known, were gradually becoming lower; but the opinion in question was to know which parts were undergoing these changes. In the Baltic, where there are no tides, it was easy to make marks in the various rocks, and, after a lapse of time, observe the alterations which had taken place; but on our own shores more complicated means were requisite. He then described the levelling of two lines by Mr. Blount and himself, which, when finished and corrected, together with additional data, would enable us to judge of the subject.

Mr. Smith, of Jordan Hill, made some remarks on a collection of shells found round the coasts of Ireland and Scotland, forty feet above the level of the sea, and eight or ten species of which were new. It would give him pleasure to present specimens to the Society.

#### SECTION F.

Col. Sykes, being called upon for his special 'Report on the Statistics of the Deccan,' divided the subject into the following sections and sub-sections, with preliminary observations of much general interest.

*Extent and Physical Features: Geology.*—Area, elevations, rivers, roads, bridges, mountains, &c., ghats, valleys, tenures, encampments, columnar basalt, schistose structure, basalt en boules, dykes, ferruginous clay, pulverulent limestone, nodular limestone, loose stones, rocky heaps, sheets of rock, structure and mineral composition of rocks, minerals, ores, natural salts, no organic remains, thermal springs, extent of trap region, laterite, granite, sedimentary rocks. *Climate.*—Barometer, atmospheric tides, temperature, monthly means, diurnal range, mean temperature, moisture, rain, winds, hot winds, whirlwinds, hail, dew, fogs, salubrity of the climate. *Botany.*—Cultivated fruits, wild fruits, agricultural products, wet season harvest, dry or spring season harvest, garden produce, edible roots, grasses, wild oil, tanning and medicinal plants, European fruits, flowering plants, timber trees. *Zoology.*—Quadrumania, cheiroptera, plantigrada, digitigrada, insessores, rasores, grallatores, natatores, ichthyology, reptilia, crustacea, testacea, entomology. *Civil Divisions.*—Poona collectorate, pergunnahs, towns, hill-forts, &c.; Ahmednuggur collectorate, talooks, pergunnahs, towns, forts, &c.; Khandeish collectorate, pergunnahs, towns, &c., rivers, Boodh cave-temples; Dharwar collectorate, talooks, pergunnahs, towns, rivers, hill-forts, &c. *Population.*—Proportion of the sexes, constituents of population, castes, births, deaths, and marriages; proportion engaged in agriculture; proportion to the square mile, to a house,

\* Want of room compels us further to postpone this interesting document until next week.

to villages, to towns; population of southern jagheerders and Rajah of Sattarah's territories. *Abstract of the Population of the late Peshwa's Territories: Education.*—Proportion of schools in the different collectorates, different kinds of. *Irrigation.*—Quantity of water supplied by well-bucket, &c.; general observations. *Agriculture.*—Agriculture of the wet-season crop (hilly tracts), wet-season crop (desh), ploughing, treading-out, farm-yard, winnowing, preserving grain; preparing grain for food, pounding, grinding, sugar-mill, oil mill, average size of farms, proportion of yoke cattle, milch cattle, ploughs, &c. *Land and other Tenures.*—Estates, hereditary and freehold, meeras tenure, kowl istawa oward, tenures marking alienation of lands, jagheer, enam, surinjam, doomalla, easaphut, deahmook and desae, desh-pandeh, pateel, koolkurnee; mahr's tenure, bara bullooth, militia, chowgulla, havildar, tulwar, ramoosee, bheels, sheeth: sharers in village revenues. *Revenue.*—Amount and account of, per centage of, branches of, viewed as a capitation tax, average village; sources of revenue, land, shops, excise, transit duties, tabular view of expenses and charges upon the revenue; number of cultivators, land revenue in the different collectorates. *Assessments.*—General observations, various names applied to different portions of land for assessment; chief assessment upon land; sootee, or permanent assessment; varieties of assessment, bhagaet, or garden; zerhaet, or field, &c.; average per begah, garden, and field; extra cesses, names of; shop taxes; evils of extra cesses; description of village accounts and documents. *Wages.*—Agricultural labourers', artificers', &c. in kind or money; table of rates of all classes of servants, artificers, &c. *Manufactures.*—Names and prices of the few remaining. *Transit Duties.*—Transit duties, how paid. *Coins.*—Silver and copper. *Weights and Measures.*—Of capacity, grain, oil, milk, and spirit; weights, goldsmiths', itinerary and long, superficial; weights and measures, how derived. *Army.*—Constitution, stations. *Justice.*—Administration of; police, return of committals, trials, &c. for four years.

The following were some of the details with which the subject was illustrated.

The four collectorates of the Deccan, within the province of Bombay, contain a population of 3,266,985 souls, and 48,987 square miles, or about sixty-seven inhabitants to the square mile; lying on an elevated plateau, formed by the ghats, and descending by a succession of steps to the Coromandel coast. The Poona collectorate contains 8281 square miles; 550,313 inhabitants; 1827 towns and villages; and 114,887 houses, averaging four and a fraction inhabitants to a house, and 247 to a village, exclusive of the city of Poona, which contains a population of 81,000. The rivers in the Deccan, during the monsoons, present magnificent streams of water; but, in the dry season, either a broad sandy plain, or a mere thread of water. The roads, with the exception of two great military roads, are untouched by art; and few of the rivers can boast of a bridge. With respect to geology, there are no organic remains, and probably no region in the world, in which the trap-formation prevails to so great an extent. In the Deccan there are 200,000 square miles, without the intervention of any other rock whatever. This is succeeded by granite and other rocks of igneous origin; so that, from the twenty-fifth degree of latitude, down to the coast of Coromandel, including

Ceylon, there are about 700,000 square miles of rocks originating in fire, probably without any of that succession which is found in Europe of rocks belonging to a newer formation, or to a middle formation. The tides of the atmosphere are one of the principal features connected with the climate of the Deccan. These tides, like those of the ocean, rise and fall twice within the twenty-four hours, at stated periods; and this in so marked and defined a manner, that the results can be determined previously almost with perfect certainty. During observations of four years' continuance, made with different instruments, there was no variation in the order of the rise and fall, though there was occasionally some little variation in the degree. The atmospheric tides prevail from the equator to the poles, and are observable to the sixty-fourth degree of latitude, the maximum being at the equator, the minimum at that degree. Although they exist in our own latitudes, it requires the mean of many observations to determine their amount. In the Deccan, as throughout the world, the barometer ranges highest in cold weather, and diminishes during the monsoon. The temperature at half-past nine in the morning is the mean temperature of the year; so that a register kept at that hour gives the mean temperature of the year. With regard to the quantity of rain, the clouds containing the water drawn from the ocean, by the action of the sun, heat against the ghats, and the rain which falls there is three or fourfold the proportion of that which falls 30 or 40 miles to the eastward. At Poona, which is not 100 miles east from Bombay, the annual fall of rain is only 25 inches, whilst in Bombay it is 82. Hail only falls at the very hottest season, with the temperature from 85 to 100. The air is perfectly clear; suddenly the horizon is overcast, the dust is blown up in dense masses; in the midst of this comes claps of thunder, perfectly astounding, and down comes a shower of hail, some of the stones excessively large, and doing a great deal of mischief. This is followed by a deluge of rain for an hour or two. Dews are very copious,—fogs little known. The climate is very salubrious. In his (Col. Sykes's) camp, consisting of 100 persons, not a single death occurred in six years; and there was only one case of sickness which he did not cure without medical aid. In 1828, the deaths were 1·82 per cent, or one in 55 persons, not including cholera, or one in 40, including cholera; so that even in India, where this frightful disease originated, it appears to be much less serious than was supposed. Dr. Lawrence had medical charge of a regiment of natives 1000 strong for several years, and lost only 0·85 per cent, or less than one per cent per annum. With respect to botanical and agricultural productions, there are 45 cultivated fruits, including six or seven species of the grape; and 22 wild fruits, including the mangosteen, the date, &c. &c. Col. Sykes has introduced five or six varieties of the grape into this country, and some of them are now flourishing in Lord Powis's gardens at Walcott, and others in the gardens of the Agricultural Society. There are two harvests in the Deccan, one called the wet-season harvest, the other, the cold or dry-season harvest; and both of distinct kinds of grain and pulse—the wet, in the hilly tracts, principally of rice. The productions of some of the grains is perfectly astonishing. Four species were mentioned—one producing 33 stalks, and 61,380 grains from one seed; another, 16,960; a third, 2985; and a fourth, 1850. One spe-

cies of wheat, taken out of a field at random, and now in his possession, contained 25 stalks and 1450 grains from one seed, the average on tolerable land being 8 stalks to each plant. There are 46 articles of garden culture; and, in mentioning those used for culinary purposes, Col. Sykes stated, that the natives are quite as carnivorous as the inhabitants of Europe, so far, at least, as mutton is concerned. The grasses are innumerable, some of them useful for cordage. There are few ferns, no heaths, and no oaks, elms, or hazels. The zoology of the Deccan exhibits specimens of most of the different orders. The wild dog is a native of the ghats. The domestic poultry of this country is supposed to have originated in India, the two species being identical. Most of the wading and swimming birds are identical with those of Europe. With respect to population, the proportion of male to female births, which in England is 100 to 93—in the Deccan is 100 to 87; and this difference obtains, with very little variation, throughout India, modified by the singular fact exhibited in the excess of grown up women over men. Sir Stamford Raffles, in his account of the island of Java, states that the proportion of births was 100 males to 82 females; but that the same disproportion did not exist between grown up people. In the Deccan, the preponderance of male over female children is very strongly marked; but a greater mortality amongst the males at a subsequent period makes the females outnumber the males. The same law, therefore, appears to prevail both within and without the tropics. The average number of deaths in 32 pergunnahs of the collectorate of Poona, was one in 37; but that was in an exceedingly bad season, when the cholera prevailed. The proportion of marriages is very nearly the same as in England and France,—it being one in 125 in Poona, one in 128 in England, and one in 130 in France. In speaking of the castes, or tribes, Col. Sykes stated, that the Mussulmans, who for so many centuries had the government of India, never amounted to one fifteenth part of the whole population of the empire; but being in various places in the proportion of 4, 6, or 8, or more, per cent to the rest of the population. With respect to education—in one province there is only one school to 2452 inhabitants; in another, one to 4639; in a third, one to 3337. The tenures of land are exceedingly numerous; but the chief part is freehold, which has been acknowledged by the native governments: and there are many descendants of those amongst whom the land was originally divided now in actual possession. Artisans of various kinds do the work of the farmers in their respective branches, and are paid by allotments of land, and a per centage on the produce. The revenue derived by the government is 82 per cent in the aggregate from land, and altogether averaged 8s. per annum for each individual, viewed as a capitation tax. The native manufacture of silk and cotton has been almost totally suppressed by the machinery of England. There are few other manufacturing products of any value, and these are not produced in the Company's territories, with one or two slight exceptions. The transit duties on the conveyance of goods are exceedingly onerous, and form a great impediment to commerce.

At the conclusion of the paper, a vote of thanks was given to Col. Sykes; and, in the course of a discussion which took place at a later period in the day, several questions were put to him, in reply to some of which he stated, that the wages of a head carpenter, as compared

with the price of grain, were from 25s. to 30s. a month; a common carpenter, 21s. to 25s.; a smith, the same; field labourers, 14s. a month for a man; from 7s. to 14s. for a woman; and 6s. for a boy; finding themselves in every thing, and working from sunrise to sunset. He was afraid that the loss of the two principal manufactures was not made up or compensated by any increase of raw produce for exportation. The cultivation of various articles for export might be greatly increased, to the advantage both of the natives and of the people of this country. It was an especial object of the Agricultural Committee of the Royal Asiatic Society in London to point out these articles, many of which were not even known in this country; as, for example, several kinds of oils, and many species of fibrous plants, suitable for cordage. The breadth of land under cultivation has not been increased of late years. The instruments were so rude and simple, that, were not the returns naturally so great, and the cost of production so trifling, the people could not live. The condition of the labouring classes is little better than that of the people in many parts of Ireland. The system of transit duties was under the serious consideration of government. Until within the last 20 years there had been constant intestine wars, which were now put an end to, under the influence of the British government.

'Abstract of the Report on Education at New York,' read by Dr. W. C. Taylor, on Monday, at the Statistical Section, and only briefly referred to in our last.

The regents of the university in the state of New York are required by law to make an annual report to the legislature on the state of education in the several colleges and academies subject to their visitation. Accurate forms of returns are sent to these institutions, and, though they have not all been filled as completely as could be desired, they enable us to form a pretty accurate view of the present condition of education in that state, and its tendency to progressive improvement, especially as regards the instruction of the higher and middle classes. In the report itself facts and opinions are blended together; but, for the purpose of bringing the results before the notice of the Statistical Section of the British Association, it has been deemed advisable to abstract the most striking facts which can be numerically expressed, and to avoid all inferential deductions; for, though statistical science is pre-eminently suggestive, experience has shewn that the passage from the figures of arithmetic to the figures of speech is more agreeable than useful. Under the direction of the regents, departments have been added to the collegiate systems for the instruction of common school teachers. The whole number of students in these departments is 228—an increase of 110 in the year. The inadequate compensation paid to teachers has hitherto deterred many from entering the profession; but, since these departments were instituted, the standard of common schools has been greatly raised, and ordinary members of them obtain from 50 to 75 per cent more than was paid to the best teachers six years ago. The average was below twelve dollars per month; but some of the instructed teachers now obtain more than eighteen dollars. The whole number of students belonging to academies under the control of the university is 6056. The number of students claimed by the trustees to have pursued classical studies, or the higher branches of English education, or both, for four months of said

year, is 4590. The amount of money apportioned by the regents from the income of the literature fund is 12,000 dollars.

	Dollars.
Value of land and buildings belonging to academies	460,503
Value of other real estate	44,232
Value of philosophical apparatus and library	32,927
Value of other personal property	154,719
Tuition money for year ending March 1, 1837	96,431
Interest on income from permanent funds	12,806
Salary of teachers	93,062
Number of books in libraries of academies	10,324
Number of teachers	261

whence it follows that the average income of each teacher is about \$356½.

The number of academies reporting to the university, including male and female seminaries, is 69; the subjects of study are thus enumerated:—

Arithmetic is taught in all the academies; Algebra, do.; Architecture, in 1; Astronomy, in 56; Botany, in 30; Bookkeeping, in 45; Biblical Antiquities, in 2; Biography, in 1; Chemistry, in all; Composition, as often as once a fortnight, in all; Conic Sections, in 4; Constitution of the United States, in 15; Do. of the State of New York, in 5; Elements of Criticism, in 8; Declamation, in all but the female schools; Drawing, in 14; Dialling, in 1; English Grammar, in all; Evidences of Christianity, in 7; Embroidery, in 1—Ladies' Institution; Civil Engineering, in 4; Extemporaneous Speaking, in 3; French Language, in 51; Geography, in all; Physical Geography, in 4; Geology, in 5; Plane Geometry, in all; Analytic Geometry, in 4; Greek Language, in all but 5; Grecian Antiquities, in 4; German Language, in 1; General History, in all; History of the United States, in 50; History of New York, in 3; Hebrew Language, in 4; Italian Language, in 3; Latin, in all but 3; Criminal and Mercantile Law, in 2; Logic, in 28; Levelling, in 2; Logarithms, in 2; Vocal and Instrumental Music, in 5; Vocal alone, in 2; Instrumental alone, in 6; Mapping, in 5; Mensuration, in 12; Mineralogy, in 4; Mythology, in 3; Natural History, in 17; Navigation, in 9; Nautical Astronomy, in 1; Natural Theology, in 13; Orthography, in all; Natural Philosophy, in all; Moral Philosophy, in 37; Intellectual Philosophy, in 30; Penmanship, in all; Political Economy, in 1; Painting, in 6; Perspective, in 1; Physiology, in 3; English Pronunciation, in 1; Reading, in all; Rhetoric, in all but 6; Roman Antiquities, in 10; Stenography, in 2; Statistics, in 1; Surveying, in 49; Spanish Language, in 5; Trigonometry, in 23; Topography, in 1; Technology, in 4; Principles of Teaching, in 14.

It would be very desirable to obtain similar returns respecting the branches of study open to youth of the middle and upper classes in England, but such information could not be obtained by individual enterprise; the person making the inquiries would probably receive, in most instances, a sharp rebuke for his impertinent curiosity, and would assuredly be refused the means of verifying the accuracy of the returns. Were such an inquiry instituted by authority, it would probably be found a valuable addition to the American form—to have columns for the number of students in each branch, and the length of time devoted to its study. In the American report there is no notice of any provision for physical training; should similar inquiries be made here, it would be well to have returns of the size of playgrounds and the supply of gymnastic exercises. The American report contains the names of the various books used in the academies: the only remark that need be made on this return is, that a preference seems generally to be given to the works of American authors. Meteorological observations, on the plan recommended by Sir John Herschel, have been recorded at fifty-three academies: some of these are open to suspicion of inaccuracy, but the regents have a plan under their consideration for rendering them more perfect and complete in future. The charges to students vary considerably in the different academies. Elementary instruction is generally rated from \$2½ to \$4 per quarter; and the higher instruction varies from \$5 to \$12. The Albany Female Academy, which appears to be of the highest rank, charges \$225 annually for board and tuition

in all branches. In some of the academies emulation has been discouraged, as a dangerous stimulant of action; in others, it is still deemed advisable to offer premiums for exertion. Both parties affirm that experience has proved the correctness of their views, but neither have supported their assertions by a reference to appreciable facts. In this year's report, the latitude and longitude of the different academies are given, their elevation above the level of the sea, and such topographical remarks as best elucidate the salubrity of their situation. These are the chief statistical results of the report: the remarks on the effect of moral discipline, and on new elucidations of the science of education, though very valuable, could not be noticed in this section.

Dr. Traill, after an apologetic exordium, said the British Association was undoubtedly suggested by the successful efforts of the philosophers of Germany, within the last few years. The obstacles to the free intercourse between scientific men, in that part of Europe, had always been felt as a great bar to the advance of science. Under such a system, those who, in sequestered regions, had long pursued laborious investigations, had often the mortification to discover that they were following paths trodden by others, or in which they had been completely anticipated by more fortunate inquirers. To obviate such grave inconveniences, and to promote social intercourse among men of science, scattered over wide regions, separated by physical and political obstacles, though connected by one common tongue, were the objects of that great Continental Association; and that these have been, to a considerable extent, realised by the annual assemblages of the illustrious sons of Germany, is generally admitted. In our more united and highly favoured land, the facilities of intercourse between its most distant points, the less isolated position of our philosophers, undoubtedly render the progress of science less dependent on such general associations of its cultivators than in Germany; yet it has never been doubted that the personal intercourse of men engaged in similar pursuits is favourable to the progress of philosophical investigations, by the direct assistance derived from the experience and suggestions of others, and by fostering that generous emulation in the search after truth which imparts a wholesome stimulus to mental exertion, while it tends to smooth the asperities occasionally engendered by controversy, even in the abstract sciences. Men accustomed to meet and act together for one great end, naturally and insensibly imbibe the social spirit—scientific jealousy and personal rivalry are softened by mutual approximations; and individuals composing the Association, like members of the same family, learn to temper the pursuit of personal distinction by an honest exultation in whatever redounds to the honour and celebrity of the body to which they belong. These advantages the British Association shares in common with many other societies; but it possesses characteristics peculiarly its own. It can scarcely reckon a period of infancy: it sprung at once from the conception of its founders, like Pallas from the head of Jove, in the perfection of youthful vigour; secure in the panoply of rectitude of purpose against open or secret hostility. It quickly numbered in its ranks the *élite* of the philosophy of the United Kingdom; and, strengthened by the accession of foreign associates of distinguished reputation, it has extended its views beyond its original horizon, and has attained a colossal magnitude that distinguishes it above every other scientific association in the

British empire. This Institution ought not to be considered as the rival of any of the previously existing philosophical establishments which give lustre to these kingdoms. It, indeed, receives communications on every branch of scientific inquiry; but it professes to publish none of the numerous contributions which have given rise to the interesting and animated discussions in its different Sections: a short abstract of these papers is all that it attempts to promulgate; but the distinguishing features of its publications are those invaluable reports on the progress of science which the Association has confided to some of its members, especially selected for that important duty. The advantages thus conferred on general science will be best appreciated by persons whose studies are directed to any of the subjects discussed in the reports, and who have once felt the want of an accurate analysis of what had been recently added to our previous stock of knowledge; but it would be impossible to calculate in how many instances those abstracts of precise and useful information have saved the time, and abridged the labour, of the retired student, in tracks already explored by other philosophers. Another peculiarity in the publications of the Association consists in the circulation of desiderata in different branches of science. The attention of their cultivators, thus drawn to the principal deficiencies in each, has already filled up various chasms in the paths of intellectual exertion, and stimulated to inquiries that cannot fail to lead to important results. It soon became apparent that the British Association must exercise a powerful influence on the general diffusion of science, and could undertake, or materially promote, investigations to which individual research and unaided exertion are utterly inadequate. Its annual migrations, and the comparative ease of admission into its ranks, have unquestionably increased the taste for scientific disquisition; and, although it would be absurd to suppose that all who seek for enrolment in the Association are destined to extend the boundaries of science, who can believe that familiarising large masses of the community with such investigations, and exhibiting how the highest branches of philosophy may be made available to the purposes of life, will fail to promote the avowed purpose of our meetings? Who will venture to deny, that the contemplation of the galaxy of illustrious men, mustered on occasions similar to the present, has often proved the first impulse to the secret aspirant after honourable distinction—has afforded the Promethean spark that kindled the sacred flame in the breast of slumbering genius? The Association has not failed to use its influence in stimulating our rulers to aid the progress of science. At its instigation, the British government has taken up the task of the reduction of the enormous mass of observations on the heavenly bodies, accumulated since 1750, at the Greenwich Observatory—which, though collected at a great expense to the nation, and by the exertion of consummate skill in the observers—which, though pronounced by the highest authorities in Europe to be of the utmost moment to the future progress of astronomy,—have been permitted to remain a rich, but unexplored, mine of facts. The voice of our petition has been heard—the work has been auspiciously begun; and 500*l.* have been assigned by the Treasury for the commencement of this great national work. The subject of the tides, so strangely neglected in this great maritime country, from the period of the promulgation of the Newtonian theory to our own times, has engaged the attention of the Asso-

ciation from its commencement. The advances which have recently been made on this subject, and which have greatly altered the aspect of that branch of science, had chiefly for their original basis the very valuable tide observations made in this port, many years ago, by Mr. Hutchinson, a dock-master, embracing an interval of above thirty years. The originals are preserved in the Lyceum Library of Liverpool; and, by the liberality of the proprietors, have been confided to the hands of Mr. Lubbock, under whose direction the discussion of them, ordered by the Association, has thrown a new light on the laws of tidal phenomena. Since that time, the earnest representations of a distinguished associate, whom this county claims as a native, have given rise to a most important set of observations on the tides. Mr. Whewell, by personal application to the chief of the coast-guard service, and solicitation to the Admiralty, has procured the completion of a continuous series of observations, at upwards of five hundred stations, along the coasts of Great Britain and Ireland. They were continued for a fortnight in June 1834, and again in June 1835, when they were extended from the mouths of the Mississippi to the northern extremity of Europe. These observations have been discussed at the expense of the Admiralty; but, as I shall presently mention, the Association has voted a large sum to be applied by Mr. Lubbock to the same subject. These discussions have, within the last few years, led to very curious results: for instance, to the fact of the rise of the mean level of the tides, in proportion to the fall of the barometer, and the existence of a diurnal tide—*i. e.* the difference between the morning and evening tides of the same day. This diurnal tide, it may be interesting for the inhabitants of Liverpool to know, was first marked in the tide tables constructed by a young ingenious townsman, Mr. Bywater, jun., who has, unfortunately for science, died since the last meeting of the Association. The importance of the subject, and the success already obtained, have encouraged the Association to direct the discussion of the tidal observations recorded at the port of Bristol, and at the London Docks; and to supply the means of defraying the necessary expense. The influence of researches on tidal waters to navigation and to commerce are too obvious to require illustration: but perhaps it may not be unsuitable, in this place, to refer to the deductions of our eminent associate, Capt. Denham, on the capability of the Mersey “to command a navigable avenue to the ocean, so long as its guardians preserve the high-water boundaries from artificial contraction.” It may also be stated that, in our Transactions, this gentleman has recorded his most important general inference (drawn from a connected series of observations on the tides, which the liberality of the Dock Trustees of Liverpool enabled him to carry on)—*that there is one invariable mean height, common to neap and spring tides*—the half-tide mark—a point from which engineers, geologists, and navigators, will henceforward commence their calculations, and adjust their standards of comparison. The Association made application soon after the meeting at Edinburgh for the resumption of the Trigonometrical Survey of Scotland; a work imperiously demanded by the imperfect state of our best maps and charts of that part of the island, either for the purposes of geology or navigation. It is needless to give further proof, than that parts of several of the large islands at the mouth of the Clyde are laid down several miles out of their true position. The magnificent scale on which the survey of Ireland is

now carrying on, emboldened various scientific societies of Scotland this year to memorialise the government on the subject. I am happy to add, that the applications have been successful, and the triangulation of Scotland will recommence early in 1838. The British Association may also boast, that at its instigation our illustrious associate, Arago, moved the Bureau des Longitudes to solicit from the French government the publication of the series of observations on the tides at Brest, and a reduction of the astronomical observations made at the Ecole Militaire. The Brest observations have been printed, and a copy of the valuable documents put in the hands of one well able to appreciate them. At the Dublin meeting, a committee was appointed for representing to our own government two objects important to science, which can only be accomplished in a satisfactory manner by the rulers of a powerful nation, or by an union of governments in the cause of philosophy. The first related to the establishment of Magnetical and Meteorological Observatories, in different parts of the earth, furnished with proper instruments, and in which the observations should be conducted on acknowledged and uniform principles. The extent, and the variety of climate, of the British possessions, indicate them as favourable points for such establishments, which have already been commenced in France and its dependencies; and may hereafter, by the co-operation of the several governments of Europe, and of our transatlantic brethren, be extended over a large portion of the civilised world. The second suggestion was the importance of an Antarctic Expedition, for prosecuting discoveries and observations in Geography, Hydrography, Natural History, and, above all, Magnetism, with a view to determine the positive southern magnetic pole or poles, and the direction and intensity of the magnetic force in antarctic regions. The East India Company was likewise to be requested to favour the same objects, especially at their establishment at Madras. The General Committee some time ago made application to the authorities, both in France and this country, respecting some mode of instituting a reciprocal protection to literary property. Might I venture here to allude to a recommendation which I hope the Association will not fail to leave in Liverpool, for the promotion of a scientific object of immense consequence to this port—the establishment of an observatory in or near Liverpool. The adoption of such suggestions, while conferring an incalculable benefit on science, would rear a proud, unperishable, and bloodless monument to national greatness. These statements might be a sufficient answer to a question, sometimes put in tones of captious sarcasm. What has the Association directly contributed to the progress of useful knowledge? Without again appealing to the very admirable reports on the progress of science published in our Transactions; without again claiming merit for the suggestions and efforts already noticed,—I should fearlessly answer such cavillers, by an appeal to the value and number of the communications which have occupied the different Sections, at each annual meeting, and which contain the application of pure science to important questions in Physics, or of experimental investigation to numerous branches of knowledge. I would point to the valuable researches which have been undertaken and completed at the request of the Association, among which it may be permitted to indicate the following memoirs:—The comparison of the standards of Linear Measure, made by the late Mr. Troughton, for

the town of Aberdeen, and the Astronomical Society of London, which were confided to Mr. Baily—a comparison of much consequence, as the *standard yard*, by the same eminent artist, was lost in the fire which consumed both houses of parliament; On the Investigation of the Impact upon Beams, when struck by bodies of different weight, hardness, and elasticity, by Mr. Hodgkinson; On the Direction and Intensity of the Magnetic Force in England, Ireland, and Scotland, by Professor Lloyd, Major Sabine, and Captain James Ross; On the influence of Height above the Sea on Magnetic Intensity, by Professor Forbes—from which it appears that the horizontal intensity diminishes <sup>1/1000</sup> of the whole, for every 3000 feet of vertical ascent; On the quantity of Rain falling at different heights above the surface of the ground, made at York, by Professor Phillips and Mr. Gray; On the determination of the mass of the planet Jupiter, by the Astronomer Royal; On the Horary Variations of the Barometer, Thermometer, Hygrometer, and Whewell's Anemometer, by Mr. Snow Harris, part of which has already appeared, and of which the sequel will be laid before this annual Meeting; On the Duty performed by Cornish Steam Engines, by Mr. Enys; On the Ratio of the Resistance of Fluids to the Velocity of Waves, by Mr. Russell and Mr. Robison, of which we expect to receive an account on this occasion. We may also be permitted here to allude to some highly interesting investigations, still in progress, under the auspices of the Association, such as—Observations on the Temperature of Springs and Deep Mines, by Instruments procured and verified by the Meteorological Council, which are already placed in various districts of Great Britain and Ireland, and also in Peru, under the direction of our scientific associate, Mr. Pentland, and from which results most interesting to Geology are anticipated; On the Temperature of the strata at different depths near Edinburgh, by Professor Forbes, for ascertaining the rate of the transmission of Solar Heat downwards; A continuation of Mr. Vernon Harcourt's experiments on the effects of long-continued Heat on Rocks and other bodies; Experimental Investigations into the Fabrication of Glass, by the same gentleman and Dr. Faraday; A Systematic Catalogue of all the Organised Fossils of the British Islands, by Professor Phillips; An Experimental Determination of the Strength and other Mechanical Properties of Iron obtained by the Hot and Cold Blasts, undertaken by Messrs. Hodgkinson and Fairbairn; Analysis of Iron in the different stages of its Manufacture, and an Extension of the Tables of Chemical Constants, by Professor Johnston; Statistical Returns of the State of Education in our great Towns; An Examination of the Statistical documents preserved in the India House, by Professor Jones; besides the discussion of numerous very interesting contested points in Natural History and in Medicine. These are satisfactory evidences of the activity of the Association; but it has not scrupled also to afford pecuniary assistance, when such aid appeared requisite to ensure success. It is true, that the moderate sum, payable on admission into the Society, seems more suited

to the finances of the majority of philosophers, than to the support of extensive enterprises; yet the numbers, annually desirous of admission, supply funds, adequate to important undertakings; and the power thus given to the General Committee is acknowledged to have been exercised with a sound discretion.

Dr. Traill then recapitulated the principal grants already recorded in our pages, and commented on the handsome use made of them by the parties to whom they were entrusted, several contributing their own labour, and all employing the most economical means to accomplish the ends in view. He also gave a critical analysis of the volume containing last year's reports and notices, which it seems to us unnecessary to recapitulate, as we have given the entire substance in our own preceding Numbers, and the details are to be found by those who require them in the volume itself.

#### REVIEW OF NEW BOOKS.

*Ernest Maltravers*. By the author of "Eugene Aram," "Rienzi," &c. 3 vols. 12mo. London, 1837. Saunders and Otley.

YEARS have passed since we first offered our warm and hopeful praise to the young writer whose promise was of that high and creative order which belongs to genius and to genius alone. Since then, what changes have passed over the earth! opinions have altered as much as tastes;—a more earnest and examining spirit has entered into even the lightest branches of literature, and no writer now could take a high stand who aimed only at amusing the reader. Mr. Bulwer has given a character which, until he came, was unknown to the novel in England. Gifted with first-rate powers of exciting sympathy—possessed of even architectural skill in the conduct of his narrative—able to fling over his pages the flashing lights of wit, and the picturesque graces of description—he has made his talents always subservient to his principles. He has never lost sight of a great whole, and a noble result. Those who read for the sake of the dramatic story, or the exquisite style, do Mr. Bulwer but half justice. Every work of his is another step in the progress of his own and his time's mind. His stories are the solutions of some moral question, and every character is a curious analysis of that "mysterious thing, the heart of man." The ideal of the good is for ever before him. The crime and the folly, the weakness and the vanity, are dissected with an unsparing hand; but faith in his kind, and an almost religious entering into its noblest hopes, are inseparable from his elevated and generous standard. Genius must turn infidel to itself, ere it disbelieve in the beautiful which is the true. The work before us appears a choice of subject peculiarly adapted to Mr. Bulwer's powers; it is the history of a mind, and a mind of genius. Who can understand its workings better than he whose mind is cast in the very mould that he draws? Not but that we enter our protest against confounding the writer and the written together. The author's impulses and experiences are cast upon his pages rather than himself: it lowers all criticism taking this personal tone, and narrows most unjustly the world of poetical conception. If one character be supposed to be the shadowing forth of its inventor, why not another? Mr. Bulwer may as well be Lumley Ferrers as Ernest Maltravers—both are drawn to the very life. Indeed, the subtle investigation into character is very remarkable; every individual is real, apart, and seems to put us in mind of some one that we have known; but each portrait, with all its strong likeness of

humanity, is not the less a type of that inward world which produces such results from causes which are the pulses of the machine. One great merit of Mr. Bulwer is, that he never confounds the social and the natural world—he sees society what it is, base, hollow, false; all that is bad, or rather, perhaps, what is mean in us, floating on the surface—but he also knows that there is another and a better world even within ourselves. To call forth its diviner glimpses; to bring into more constant operation our more kindly feelings and our more lofty thoughts; to awaken the light which should be at the heart, is a writer's highest duty; and who has fulfilled this duty more gloriously than Mr. Bulwer has done? The present volumes are written to develop the poetical character in *Ernest Maltravers*; but we will give his object in his own words.

"He is a man with the weaknesses derived from humanity, with the strength that we inherit from the soul; not often obstinate in error, more often irresolute in virtue; sometimes too aspiring, sometimes too despondent; influenced by the circumstances to which he yet struggles to be superior, and changing in character with the changes of time and fate; but never wantonly rejecting those great principles by which alone we can work out the science of life—a desire for the good, a passion for the honest, a yearning after the true. From such principles, experience, that severe teacher, learns us at length, the safe and practical philosophy which consists of fortitude to bear, serenity to enjoy, and faith to look beyond! It would have led, perhaps, to more striking incidents, and have furnished an interest more intense, if I had cast Maltravers, the man of genius, amidst those fierce but ennobling struggles with poverty and want, to which genius is so often condemned. But wealth and lassitude have their temptations as well as penury and toil."

The story begins with a dream of poetry and love—a dream soon and rudely broken, yet exercising its influence to the last: and herein is finely wrought the true moral of punishment. Ernest begins his career with an error, and its consequences endure. The feverish happiness contrasts with all that follows: memory always exaggerates, and the first step is taken in suffering, when there is that in the past to which we perpetually refer in the present. The whole history of Alice is terribly touching, because terribly true. We might shudder even while standing in the sunshine, to think of the fearful suffering by which we are surrounded; but hard as physical anguish is to bear, harsh as is the lot of poverty, with its cold and its hunger, yet pain takes no shape so utter in its torture, as when it makes its ministers of the affections. No evil is like the evil within ourselves. In perpetual contrast with each other, the ideal and the real standing side by side, are the two principal characters. Ernest Maltravers imaginative, therefore, high-minded, actuated by a consciousness of power, and the responsibility that power owes to its kind; Lumley Ferrers, shrewd, calculating, selfish, and referring all things to his own miserable interest: such are the two that in these pages work out their most opposite destinies. Ernest Maltravers is only the beginning of life; the lesson of the close remains to be given—we trust that Mr. Bulwer will not pause till it be complete. We shall now proceed to take some specimens from these pages, which, however, require to be read entire; "here a little, and there a little," will do them but scant justice.

*A Character*.—"His name was Lumley Fer-

\* Referring to the paper 'On the Construction of Magnets,' in page 587, middle column, we are informed that Mr. Holden maintained that cast-iron palisades became magnets, by standing a few days in an upright position; but whether they would retain the magnetic power, if reversed, he thought very questionable. In answer to Mr. Christie, he stated that, in his practice, he had found that good steel, hardened and tempered to a spring temper, about that of a good sword, both received and retained the magnetism,—as he had needles which had retained it more than twenty years.

ers, his age about twenty-six, his fortune about eight hundred a-year: he followed no profession. Lumley Ferrers had not what is usually called genius, that is, he had no enthusiasm; and if the word talent be properly interpreted, as meaning the talent of doing something better than others, Ferrers had not much to boast of on that score. He had no talent for writing, nor for public speaking, nor for music nor painting, nor the ordinary round of accomplishments; neither at present had he displayed much of the hard and useful talent for action and business. But Ferrers had what is often better than either genius or talent; he had a powerful and most acute mind. He had, moreover, great animation of manner, high physical spirits, a witty, odd, racy vein of conversation, determined assurance, and profound confidence in his own resources. He was fond of schemes, stratagems, and plots—they amused and excited him; his power of sarcasm and of argument, too, was great, and he usually obtained an astonishing influence over those with whom he was brought in contact. His high spirits, and a most happy frankness of bearing, carried off and disguised his leading vices of character, which were an extraordinary calousness of affection, and an insensibility to moral principles. Though less learned than Maltravers, he was, on the whole, a very instructed man. He mastered the surface of many sciences, became satisfied of their general principles, and threw the study aside, never to be forgotten (for his memory was like a vice), but never to be prosecuted any further. To this he added a general acquaintance with whatever is most generally acknowledged as standard in extant or modern literature. What is admired only by a few, Lumley never took the trouble to read. Living amongst trifles, he made them interesting and novel by his mode of viewing and treating them. And here indeed was a talent—it was the talent of social life—the talent of enjoyment to the utmost with the least degree of trouble to himself. Lumley Ferrers was thus exactly one of those men whom every body calls exceedingly clever, and yet it would puzzle one to say in what he was so clever. It was, indeed, that nameless power which belongs to ability, and which makes one man superior, on the whole, to another, though in many details by no means remarkable. I think it is Goethe who says, somewhere, that in reading the life of the greatest genius, we always find that he was acquainted with some men superior to himself, who yet never attained to general distinction. To the class of these mystical superior men, Lumley Ferrers might have belonged; for though an ordinary journalist would have beaten him in the arts of composition, few men of genius, however eminent, could have felt themselves above Ferrers in the ready grasp and plastic vigour of natural intellect."

*Beginning to write.*—"Maltravers was not much gnawed by the desire of fame—perhaps few men of real genius are, until artificially worked up to it. There is, in a sound and correct intellect, with all its gifts fairly balanced, a calm consciousness of power, a certainty that when its strength is fairly put out, it must be to realise the usual result of strength. Men of second-rate genius, on the contrary, are fretful and nervous, fidgeting after a celebrity which they do not estimate by their own talents, but by the talents of some one else. They see a tower, but are occupied only with measuring its shadow, and think their own height (which they never calculate) is to cast as broad a one over the earth. It is the short man who is always throw-

ing up his chin, and is as erect as a dart. The tall man stoops, and the strong man is not always using the dumb-bells. Maltravers had not yet, then, the keen and sharp yearning for reputation; he had not, as yet, tasted its sweets and bitters—fatal draught, which, once tasted, begets too often an insatiable thirst!—neither had he enemies and decriers whom he was desirous of abashing by merit. And that is a very ordinary cause for exertion in proud minds. He was, it is true, generally reputed clever, and fools were afraid of him; but as he actively interfered with no man's pretensions, so no man thought it necessary to call him a blockhead. At present, therefore, it was quietly and naturally that his mind was working its legitimate way to its destiny of exertion. He began idly and carelessly to note down his thoughts and impressions; what was once put on the paper begot new matter; his ideas became more lucid to himself; and the page grew a looking-glass, which presented the likeness of his own features. He began with writing with rapidity, and without method. He had no object but to please himself, and to find a vent for an over-charged spirit; and, like most writings of the young, the matter was egotistical. We commence with the small nucleus of passion and experience, to widen the circle afterwards; and, perhaps, the most extensive and universal masters of life and character have begun by being egotists. For there is, in a man that has much in him, a wonderfully acute and sensitive perception of his own existence. An imaginative and susceptible person has, indeed, ten times as much life as a dull fellow, 'an he be Hercules.' He multiplies himself in a thousand objects, associates each with his own identity, lives in each, and almost looks upon the world, with its infinite objects, as a part of his individual being. Afterwards, as he tames down, he withdraws his forces into the citadel; but he still has a knowledge of, and an interest in, the land they once covered. He understands other people, for he has lived in other people—the dead and the living;—fancied himself now Brutus and now Caesar, and thought how he should act in almost every imaginable circumstance of life. Thus, when he begins to paint human characters, essentially different from his own, his knowledge comes to him almost intuitively. It is as if he were describing the mansions in which he himself has formerly lodged, though for a short time. Hence, in great writers of History, of Romance, of the Drama, the *gusto* with which they paint their personages; their creations are flesh and blood, not shadows or machines. I ought, perhaps, to apologise for these reflections; but, if I do so, I must apologise often in this narrative. For, after all, it will mix much of the essay with the novel; and I have abstained enough from the didactic, in my later fictions, to make me hope I may have my own way in this. Maltravers was at first, then, an egotist in the matter of his rude and desultory sketches—in the manner, as I said before, he was careless and negligent, as men will be who have not yet found that expression is an art. Still, those wild and valueless essays—those rapt and secret confessions of his own heart—were a delight to him. He began to taste the transport, the intoxication of an author. And oh, what a luxury is there in the first love of the Muse! that process by which we give a palpable form to the long-intangible visions which have fitted across us;—the beautiful ghost of the Ideal within us, which we invoke in the Gardara of our still closets, with the wand of the simple pen!"

We close with one of those touches of poetry

—that yearning after the ideal—which sheds over Mr. Bulwer's pages "golden exhalations from the dawn."

"That serene heaven, those lovely stars," said Maltravers, at last, "do they not preach to us the philosophy of peace? Do they not tell us how much of calm belongs to the dignity of man, and the sublime essence of the soul? Petty distractions and self-wrought cares are not congenial to our real nature; their very disturbance is a proof that they are at war with our natures. Ah! sweet Florence, let us learn from yon skies, over which the old Greek poetry believed brooded the wings of primæval and serene love, what earthly loves should be—a thing pure as light, and peaceful as immortality, watching over the stormy world that it shall survive, and high above the clouds and vapours that roll below. Let little minds introduce into the holiest of affections all the bitterness and tumult of common life! Let us love as beings who will one day be inhabitants of the stars!"

We feel that we have not, that we cannot do justice to these thoughtful, these beautiful pages. *Ernest Maltravers* is one of those books over which we should be glad to linger, "making more full acquaintance with its depths." As it is, we can only dismiss it with cordial admiration, and feel that it is at least pleasant to be among the first who praise.

*Letters descriptive of the Virginia Springs, the Roads leading thereto, and the Doings thereat.* By Peregrine Prolix. 18mo. pp. 248. 2d Edition. Philadelphia, 1837. Tanner.

WE noticed the first edition of this little book, which, probably, procured us the compliment of an early copy of the second from Philadelphia, and containing eight letters, in addition to the twelve originally published. In these the author tells us, that, having "*loco-moved*," *viâ* Baltimore, up the Chesapeake to James' River, and so to Richmond, at the expense of seventeen dollars, he thence pursued his course to Lexington, and thereafter visited the country and the springs here described. As few of our readers, perhaps, on this side of the Atlantic, are likely to want a guide to these salutary waters, and those on the other side can have ready access to the original, we shall be content to exemplify it by a few selections which illustrate the style of the writer, and some features of Old Virginny. After crossing the Blue Ridge, it is stated:—

"Every body in this vicinity will tell you that the distance from Lexington to the Natural Bridge is twelve miles; but the shortest route is fourteen miles, six of which being supposed to be impassable, in consequence of the superabundance of rain, the driver of my hack, by name Oliver (a melanthrope of great skill in his art), pursued a route three miles longer. Not being aware of the inconceivable badness of the road, and being naturally averse to early rising, I did not leave Lexington until nine o'clock. Oliver soon horrified me by turning into the road we travelled last evening, and informing me we must pursue it for six miles, and then take a cross road for three miles to get into the direct route. This was bad news, for, in a region of bad roads, the cross roads are the worst, and are as bad as the cross women. And, indeed, until within two miles of the bridge, the road is so pre-eminently abominable, that it has won to itself the title of purgatory, and, like that uncomfortable place, when once in, it requires much whipping to get you out. Notwithstanding the difficulties of mud and mire, rut and rock, hill and hollow, the skilful

Oliver landed me safe at the house near the bridge at two P.M. A melanchropic guide conducted me immediately down a winding rocky path to the bottom of the deep chasm, in which flows the little stream called Cedar Creek, and across the top of which, from brink to brink, there still extends an enormous rocky stratum, that time and gravity have moulded into a graceful arch. The bed of Cedar Creek is more than two hundred feet below the surface of the plain; and the sides of the enormous chasm, at the bottom of which the water flows, are composed of solid rock, maintaining a position almost perpendicular. These adamantine walls did not seem to me to be water-worn, but suggested the idea of an enormous cavern, that in remote ages may have been covered for miles by the continuation of that stratum, of which all that now remains is the arch of the Natural Bridge. I do verily believe that this stupendous object is the ruin of a cave, one of those antres vast in which our limestone regions abound, and which, perhaps, existed previous to the upheaving of our continent, and was tenanted by naiads, tritons, and other worthies of the deep. The first sensation of the beholder is one of *double astonishment*; first, at the absolute sublimity of the scene; next, at the total inadequacy of the descriptions he has read, and the pictures he has seen, to produce in his mind the faintest idea of the reality. The great height gives the arch an air of grace and lightness that must be seen to be felt, and the power of speech is for a moment lost in contemplating the immense dimensions of the surrounding objects. The middle of the arch is forty-five feet in perpendicular thickness, which increases to sixty at its junctions with the vast abutments. Its top, which is covered with soil, supporting shrubs of various sizes, is two hundred and ten feet high. It is sixty feet wide, and its span is almost ninety feet. Across the top passes a public road; and, being in the same plane with the neighbouring country, you may cross it in a coach without being aware of the interesting pass. There are several forest-trees, of large dimensions, growing near the edge of the creek directly under the arch, which do not nearly reach its lowest part. The most imposing view is from about sixty yards below the bridge, close to the edge of the creek; from that position the arch appears thinner, lighter, and loftier. From the edge of the creek, at some distance above the bridge, you look at the thicker side of the arch, which, from this point of view, approaches somewhat to the Gothic. A little above the bridge, on the western side of the creek, the wall of rock is broken into buttress-like masses, which rise almost perpendicularly to a height of nearly two hundred and fifty feet, terminating in separate pinnacles which overlook the bridge. It requires a strong head (perchance a thick skull) to stand on one of these narrow eminences, and look into the yawning gulf below. When you are exactly under the arch, and cast your glances upwards, the space appears immense; and the symmetry of the ellipsoidal concave formed by the arch and the gigantic walls from which it springs, is wonderfully pleasing. From this position the views in both directions are sublime and striking, from the immense height of the rocky walls stretching away in various curves, covered in some places by the drapery of the forest, green and graceful, and in others without a blemish or a bush, bare and blue. I gazed upon this wondrous scene for an hour and a quarter, a period ten times too short to realise its grandeur; but having before my

eyes (my mind's eyes, Horatio) the fear of a bad road and a moonless night, I forced my reluctant footsteps up the hill, swallowed my mush and milk (too hot) with haste, and at half-past three began my toilsome travel back to Lexington.

"Reader, do not allow the coolness of the neighbours, or the heat of the weather, or the badness of the roads, or the goodness of your equipage, or the inertia of your disposition, or the gravity of your baggage, or the levity of your purse, or the *notion* of your womankind, or any other creature of any other kind, to prevent you from going to see the Natural Bridge; you never saw its like before, and never will you look upon its like again."

The effects of the adjacent White Sulphur Springs are graphically painted:—"It is (observes the author) pleasant to perceive the gradual change which takes place in the countenances of your valetudinary acquaintances: how, during the first week, the hypochondriac aspect begins to cheer; during the second, the sallow southern hue begins to shade off into a healthy white and red; during the third, the tongue from white to red begins to turn, and, finally, in the fourth week, the elasticity of the step, and the keenness of the appetite, are a double witness that the man is well. \* \* \* From five to eight glasses a day are enough; but the water should be taken for three or four weeks; and the diet should be light, and little in quantity, and digestible in quality. Some people erroneously suppose, that if a little is good, more is better; the Hibernian did not err more, when, being told if he used a stove he would save half his fuel, exclaimed, 'Och! then, I will use two and save it all.'" At another spring the tap is kept by a Captain Lange—speaking of whom, we are told of a new mode of promotion to military rank in the U. S.—

"During the last war, Monsieur Lange led a company of patriotic volunteers to the seaboard to repel the invading Briton, and ever since he has retained the title of captain, not having been fortunate enough to kill a rattlesnake, and thereby to reach the rank of major."

With the writer's departure from this, we shall conclude our specimens:—

"It rained potentially all night, and, therefore, I discharged my hack, opining it were better to confide in the greater strength of the stage-coach, and in the superior skill of the driver thereof. The Staunton coach did not arrive until 11 A.M. having suffered a runaway, from the driver having been jolted off the box; and there being but three passengers, we took possession of the back seat, which was politely yielded to us, on account of my elderly and convalescent aspect. The copious rain had converted the naturally bad road into one great quaggy mass of mud and stones, which made our rate of motion less than four miles an hour. Our fellow-passengers were an army officer, a Harrisonburger, and an Arkansawyer. The last was a rough, unkempt, good-looking, manly fellow, six feet two inches high, a Virginian by birth, who had left his native state six and twenty years ago, to seek his fortune in the boundless west. His parents were still living in Virginia, and he was on his way to make them his first visit. This was the first journey he had ever taken in a stage-coach, and the confinement and risk of bones were very irksome to him. We got a dinner at New Market, not worth the time we lost in waiting for it, and arrived at Mount Jackson at half past five, P.M. We changed horses at the Swan, kept by Mrs. Stewart, who has enlarged her house, which exhibits every in-

dication of comfort and plenty. About sunset it began to rain, and soon became pitchy dark, and before the lamps were lighted, our Arkansawyer expressed his unhappiness in the following outpouring or *quasi soliloquy*: 'It was the first time, and it should be the last he would ever get into such a fix; shut up in a dark box, tumbling about every which way, and every minute liable to break one's neck, without being able to see how to help it; give him a Bowie knife, and he had rather fight a bear. His mother used to say, 'my son, never go into any place blindfold; always have your eyes about you.' That was good advice, and he had always kept it until that night, and he always will keep it hereafter. Nobody shall ever catch him in such another fix.' This gentleman was full of sense, mother-wit, kindness, heartedness, and good-humour; well versed in the politics of his locality; and his wild appearance the quaintness of his western idiom, and the raciness of his observations, made him quite an interesting character."

*The Old Commodore.* By the Author of "Rattlin the Reefer." 3 vols. 12mo. London, 1837. Bentley.

THE ocean has now a literature of its own, with its own wild character imprinted upon it. We cannot imagine a time when such works will cease to be popular in England; they embody much that belongs to no other country in the world; their adventure and their humour are essentially national. Now, Mr. Howard is among the best of his class; his scenes are dramatic; they are not like

"A painted ship  
Upon a painted ocean;"

but alive, stirring, and keeping their readers alive as well. It is a curious thing that this whole school of what we may call marine painting, only excels on its own peculiar element. The moment the writers look out for material on land, they at once become exaggerated, improbable, and go back upon the relics that remain "long lingering by the shores of old romance." It is the case with the present work; the land part of the story is diffuse, extreme, and unlikely; but once with "a wet sail and a flowing sheet," and the author is at home. We know nothing better than the portrait of the Old Commodore, both in his first harsh recklessness, or after "a deep distress has humanised his soul." Perhaps there is nothing so deeply touching as the episode of the Creole girl in "Rattlin the Reefer," but the salt-water interest is kept fresh to the last. As, however, Sir Octavius is of the roughest sort, we had better take him at feeding-time, giving our readers the benefit of his speech beforehand. We must premise that provisions have for some time run short among his crew.

*The Commodore's speech.*—"My men, I have served his majesty before most of you were born—(the hat lifted as usual at 'majesty')—and at a time when British seamen gloried in their hardships, and could live upon their glory, for they had very often little else to eat; but you—you are a fallen race, a set of gormandising rascals, who are only thinking of how much living fat you can turn his sacred majesty's, God bless him!—(hat higher than usual)—pork and pease into. It is of no use telling such ravenous eaters as you are, how, when I sailed in the *Weazel*, in the Dutch war, the men were put upon an ounce of bullock's hide, taken off the main yard, per day per man, and when this failed us, we tried what kind of wood, when reduced to sawdust, would make the best substitute for flour. After several trials, we found

that the hard wood we got from the Spanish main answered the purpose best; and, ever after, it was called *lignum vitæ*, or the log of life, just in the same way as we call bread of wheat or barley meal the staff of life; and then the little round wooden wheels in our blocks began to get the name of sheaves, for really they were as sheaves of corn to us. Now, you lubbers! I can tell you, that this log-of-life bread was very nutritious, when you had digested it, though I confess that it was rather hard for the teeth; the only two imperfect grinders that I have in my head, I broke in gnawing it; but, you dogs! I should have bolted it, as the Derbyshire clodhoppers do fat bacon. Oh! I see I am making your hungry chups water at the bare idea of the greasy delicacy. I was wrong; I must 'bout ship, and stand on the other tack. Now, my men, ever since I have had command of this ship and squadron, I have been like a father to you all. 'Ay,' said the full-faced chaplain, who had placed himself close to the orator's elbow, 'you have always imitated the divine example; you have chastened those whom you have loved.' 'Give us none of your jaw till church time,' said his amiable communicant, twisting his spiritual adviser out of the way by means of his iron hook: he continued, 'So, my men, d'ye see, I love you like my own children; and, bating that I have spared the rod, I have proved myself to you a wise and indulgent parent—a little too indulgent, mayhap—allowed a little too much for lee-way in my dead reckoning with you all, but I hope none of you will take advantage of my weakness. Now, for the good of his majesty's service, God bless him, and may he never see a banyan day!—(hat lifted)—you have all been placed six upon four; and hot weather and long keeping will make salt pork and beef shrink like a lawyer in his shroud. I know all this, and I likewise know that ye are not like the men I sailed with in the Dutch war; in those days four of them would eat up an ox at a meal, or live upon his hoofs for a fortnight, as the case might be, according to orders, and as was most fitting for the good of the service. Ah! there were giants in those days; and sages, too, who made their giants' strength still stronger by their wisdom; and it was those sages who taught the seamen, when provisions ran short, how to make devil's dumplings. Now, my men, as I wish you to make the most of your rations, and as I do not think that any considerations could induce me to allow you to eat the hides of the yards, or grind up the blocks for flour, you had better listen attentively;—and then the Commodore, taking out of his pocket a well-thumbed volume of Roderick Random, which he generally carried about with him, holding the book in his right hand, commenced very deliberately turning over the leaves with his iron left, as if to discover the right place, and then, pretending to read, went on, with a look sour enough to pickle cabbage without vinegar, as follows: 'Page the 75th, chapter the 14th. 'How to make devil's dumplings. Let the cook of the mess take a four-and-twenty-pound shot, or a shot of any other weight, the heavier the better, and clean it well with spittle and fresh oakum.' Here, three midshipmen burst out into indecorous laughter, and were immediately sent to the three respective mast-heads, for their unmannerly interruption of the solemnity of the proceedings; and, after the Commodore had eyed them half up the rigging, he continued to appear to read—'Spittle and fresh oakum \_\_\_\_.' 'And then gut it and skin it 'ill come next,' said Stubbs, *sotto voce*, to his

neighbour on the line; 'and what will the gunner say?' 'And fresh oakum; then take all the bones you can get, whether of pork or of beef it matters not, and pound them into a pulp, of the consistency of damp flour. You must then return the shot to the shot-rack, and take for every handful of said pulp three handfuls of oatmeal, mix carefully with cold water, and knead all together into dough, and then tie up into dumplings of half a pound each, boil three hours in salt water, season them with gunpowder, and serve up hot as hell. The above dish will be found the most wholesome and savoury that you can put upon the mess-table, when no better can be procured.' 'I arn't a morsal o' doubt of it, Sir Hocktious,' said a grim old quarter-master, one of the instructed.' 'Nor I either, nor any reasonable man,' said the Commodore, in continuation. 'But here is a note at the end of the recipe, which I feel bound to read to you. 'If any sea-faring man, whether sailor or marine (the cook having left any splinters of the said bones unpounded), should, enticed by the reliah, swallow portions of these dumplings too greedily, and the said bones, or any of them, stick in his throat, he may relieve himself, either by thrusting them down with a greased monkey's tail, or have them forced upwards, by requesting his messmates to pummel him between the shoulders, to do either of which he may use his pleasure; and then the cook may be suitably clobbered afterwards.' "

This is followed by the dinner:—

"For the first course, there was at one end of the table a soup made of the ship's pease—gray-coated gentlemen that scorned to be split, and endowed with a surprising hardness of heart, considering the boiling to which they had been subjected; but this preparation was made unctuous, and consequently nutritious, by gobbets of fat and rancid salt-pork, floating amongst the impervious pease; and at the other end there stood a superb tureen of lobscouse. Everybody knows what lobscouse is; it is a dish fit for the gods, and of that satisfying nature, that a spoonful is sufficient for a whole year for a mere mortal, when he can get any thing else to eat. There were two dishes of fish in the centre; a shark had been caught the day before, and these dishes were parts of one of them—strips of the tail fried in Florence oil, and the other strips of the said tail boiled *au naturel*.

"The third course made its appearance: under the nose of the Commodore smoked an apple plum-duff, baked. The centre dish was a failure, being nothing better than ship's biscuit baked, so that if you ate it, you did not eat the insect tribes that it contained alive. There should have been there a superb dish of twice-laid, only the rats had eaten up all the salt-fish, and the Commodore and his friends had eaten up all the potatoes; but there were ample amends made for this disappointment in the noble dish of dough-boys, that fumed up odoriferously at the lower end of the table, with its accompanying rich sauce of Florence oil, cinnamon, and sugar. The Commodore peered his one eye over at them; the first lieutenant ogled them with both his; the second lieutenant stared at them; the chaplain mentally blessed them, and had a great mind to do them honour, by resaying over them the grace before meat; the purser was singling out the largest; and the midshipman had already one hand upon the sauce-boat in blissful anticipation. Now, the Commodore's dough-boys were famous throughout the fleet; the dough-boy of nautical eating is generally

nothing more than a mixture of flour and water, boiled unleavened bread, so tenacious and hard, that you might use them for a bowl for skittles; or, on an emergency, fire off for round shot, and with good hopes of doing considerable execution. But the Commodore's dough-boys were *toute-autre-chose*. The cook of the generous giver of dough-boys was a Palermeritan, and he had a secret entirely his own, of making these little puddings almost as light as a *vol-au-vent*; and the process he used for their fermentation left after it neither the bitter taste of yeast, nor the sour one of the common French leaven. The Commodore had always a few barrels of the finest American flour devoted to the sole purpose of manufacturing these delicacies. They are on the table, exactly six of them, looking rich in the brown sauce with which they are covered, and corresponding to the number of guests at the table. The Commodore having a design upon two of them for his own share, commences with an insinuating smile to his first-lieutenant, 'Shall I help you to a slice of this plum-duff? it looks very good.' But the artifice was seen through. 'I thank you, Sir Octavius—no; a dough-boy, if you please.' To the same hypocritical question all around, he received no other answer than that of, 'A dough-boy, if you please, sir.' At length, each is happy at having one of the coveted globes smoking on his plate, and swimming in a fresh supply of sauce. Almost simultaneously, a piece, not remarkable for its diminutive size, is conveyed into the mouth of each, and with a crash spat out again by four of the party—the midshipman and the parson had bolted theirs in their epicurean eagerness; then followed execrations and curses, and the calling for water, to wash away the taste of the abominations from their mouths. In the first paroxysms of his rage the Commodore sent for his steward, his cook, and his cook's-mate, fully resolving to make them eat up the horrible compound, and then to procure them a good digestion for it, by giving them six dozen a-piece. As the astonished accused stood trembling and protesting their ignorance, the purser commenced a more minute examination of his dough-boy, which he had taken care should be the largest. Upon forcing it open with his knife and fork, he discovered in the centre a slip of paper, upon which was written legibly, 'A devil's dumpling, respectfully presented to Sir Hocktious Backy Squirt. N.B. Greased monkeys' tails can be had of the gunner, upon application.' "

A dinner often leads to important results: it does in this case. We regret that we have not room for the capture of *La Magnifique*: we can now only commend to our readers the remaining exploits of "the Old Commodore."

#### MISCELLANEOUS.

*Duncombe's Acting Edition of the British Theatre: No. CCLX. The Cavalier.*—From a list on the wrapper, we perceive that this cheap edition of the drama comprises most of the pieces acted at our various minor theatres; and a goodly number they are, seeing that the present publication is above 200. *The Cavalier*, as brought out at the Haymarket, displayed considerable powers, but was altered, in consequence of the catastrophe being thought by some to be too deep for domestic tragedy. It is here printed in its softened form, though we cannot say that we agree with those who seem to wish the tragic muse, before she quits the stage, to drop all her tears, and exit in smiles. We have only to repeat that the author, in either case, displays much dramatic talent.

#### ARTS AND SCIENCES. BOTANICAL SOCIETY.

SEPTEMBER 7th. J. E. Gray, Esq. F.R.S., president, in the chair.—A paper was read on a new species of *Loranthus*, accompanied

by a highly finished drawing, named by Mr. Schomburgk, *Loranthus Smythii*, in honour of Lady Jane Carmichael Smith, a great admirer of botany, which created much interest. The thanks of the Society having been ordered to be returned to Mr. Schomburgk for his kind assistance, he was unanimously elected a foreign member.\* Donations of many hundred plants were announced, and the president, previous to adjourning the meeting, begged to impress upon the members the necessity of speedily sending in such duplicates of plants to the Herbarium as they could spare, in order that the general distribution of the Society's duplicates might take place in the months of December and January. The meeting then adjourned until the 5th of October.

#### LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

THE following gentlemen of the University of Oxford were admitted into holy orders on the 6th of August, at an ordination held in the Cathedral Church of Ripon by the bishop of that diocese:—

*Deacons*.—F. W. Faber, B.A., University College; A. Gatty, B.A., Exeter College; J. Boustead, M.A., Queen's College; E. Roberts, B.A., Jesus College; G. A. Wright, B.A., Worcester College; G. T. C. Lamotte, B.A., Balliol College.

*Priests*.—F. F. Langston, M.A., St. John's College; R. F. Taylor, M.A., Brasenose College; W. J. E. Rooke, M.A., Brasenose College.

#### FINE ARTS. NEW PUBLICATIONS. ANAGLYPTOGRAPHY.

*Portrait of the Duke of Wellington.*  
Jennings.

AMONG the latest of the beautiful productions of Mr. Bate's patent machine for engraving from reliefs—to which he has given a high sounding, but good classical name, Anaglyptograph—is this capital portrait of the Duke of Wellington, from a medal after a model by P. Rouw. This is, in our opinion, the most striking production of this curious art that we have seen: its beautiful execution, bold relief, and perfect truth, justify all the conclusions to which we came in our *Literary Gazette* for Feb. 11, 1837.

It is stupid blindness not to see the difference in the spirit, the brilliancy, and accuracy of representation, between such productions of Bate's patent machine and those by the French process. We certainly marvelled much that the party interested in publishing the French print of his late Majesty William IV. should have given to the world the letter of Sir Francis Chantrey, admitting, as it does, the distortion of the representation: perhaps we marvelled a little at his writing it; but before this distinguished artist is again coaxed into any praise of such a work, we hope he will look well at some of the accessories in the Frenchified exuberance of ornament around the head: if any regular form be ruled there, he will instantly detect a greater amount of distortion than he may think exists in the work. Let him and the world look at the crown above the head in the print of the late king, and they will instantly perceive the distortion which exists throughout the entire work in the same proportion: it is only less offensive where the relief is lower. In a head, which is an irregular object, this is not so obvious, except to an artist. No artist would have placed the ear so far forward, or squabbed the features so monstrously. This is the distortion produced by the French machine in the heads of Louis Philippe and William IV.; the

result of the necessity of crowding the remaining lines and form between the ear and the outline of the face. Wherever there is a rim to any medal which the French have engraved—even in their prospectus specimen circulated for the Napoleon medals—let the light side and the dark side be compared, the former is as much broader as the elevation of the rim is above the field of the medal; and this proportionate distortion exists in every part of the figure raised above the field. Yet, that this may not be mistaken for perspective, let it be observed, that the rim and the field are, in the engraving, both circles; but they are not concentric. Compare such specimens with this head of Wellington, engraved by Freebairn, with Bate's machine, wherein every point in the model is truly placed. Yet, when the medal, from which this was engraved, was shewn to one interested in foisting the French process as perfection upon the public, he asserted to the publisher of this print, that it could not be engraved by Bate's instrument, but *must be sent to France!* The unmeasured impudence of this assertion is proved by this print, which we challenge the French party to imitate by their machine with the entire relief and the same accuracy; or let them, if they can, engrave so simple a form as a cone upon a square base, like our former specimen, or any other regular figure in relief, without betraying the imperfection of their machine; they cannot, unless by adopting the principle of Bate's Anaglyptograph, when they will expose themselves to prosecution for a violation of his patent.

The hint may not be wasted which also suggests a little more truth and fairness in those who describe what the English can do in this art as contemptible,—a practice which the party, who asserted that it was necessary to send this head of Wellington to be engraved in France, too much indulges in. Sneers and innuendos will neither make Bate's productions false, nor those of the French true. The injuries of such misrepresentation has always recoiled upon the party; and all the exposure they have lately received from us has been provoked by their efforts to vilify English art and artists. There is room enough for their productions and ours; since it has been observed of quacks, that they are employed by those who do not think or judge, whilst the regulars are encouraged by those who do. Upon this principle, the ignorant will be served with the imperfect productions of the French; and those who have taste and judgment, with the beautiful and accurate productions of Bate.

Since we investigated this subject, we have felt warmly for the success of the British invention and patentee. If our neighbours can excel us in a fair competition, they shall have our praise; but, until they can do this, we shall not let the assertions and assumption of interested persons pass without exposure.

*Illustrations of the Landscape Annual, for 1838.* Jennings and Co.

WE have before us the *Illustrations* of the volume of the *Landscape Annual*, which will be published next month. This volume, we regret to say, will complete the series of views in Spain. We regret this, because we know it will be difficult to select any other country so abounding with magnificent and picturesque subjects, both of nature and of art. An agreeable variety is communicated to the volume, by its containing "several views of the most striking objects in the adjoining (?) kingdom of Morocco." The whole of the plates are exquisitely engraved, by Messrs. Adlard,

Allen, Brandard, Carter, Challis, Cousen, Fisher, Goodall, Higham, Jeavons, Karnot, Stephenson, Wallis, and Willmore, from drawings by David Roberts, Esq., made, many of them, after sketches by himself, the remainder after sketches by Colonel Harding, and Lieutenants Edridge and Smith, of the Royal Engineers, and Richard Ford, Esq. The views are full of romantic character. Of those in Spain, some of the most striking are, "Interior of the Cathedral of Seville," "Gate of the Serranos, Valencia," "Leaning Tower at Saragossa," "Segovia," and "Placencia,"—"General View of Morocco," "Great Square at Tetuan, from the Jews' Town," "Citadel of Tangiers," "Rabatt and Sales," and "The Town of Constantina," are distinguished among the Morocco subjects for their beauty. The last-mentioned, circumstances have rendered especially interesting. It will not surprise those who look at it, that the French were foiled in their attempt to obtain possession of a place, which, except by a narrow bridge over a deep abyss, that might be destroyed in a few minutes, appears to be absolutely inaccessible. We must not omit to mention the happy manner in which Mr. Roberts has enriched the various scenes, by groups of animated and picturesquely habited figures.

*The Wife.* Painted by E. Prentis; engraved by J. C. Bromley. Graves.

A FINE personification of the apostrophe in Sir Walter Scott's admirable and well-known contrast between the several qualities of the female character:—

"A ministering angel thou!"

It represents a tender wife, anxiously watching the midnight slumbers of a beloved husband laid in the bed of sickness; and, like all Mr. Prentis's works, evinces great talent, while it assists in the inculcation of those domestic charities and affections that can alone render existence a blessing.

*Thirty-four Subjects of Cattle, &c.: Designs for Pictures.* By T. S. Cooper. Printed at A. Ducôte's Lithographic Establishment. M'Lean.

THE finest work of the kind that has ever come under our review. Mr. Cooper's well-known skill in the delineation of animal nature renders it unnecessary for us to expatiate on the attractive character of these designs, further than to observe, that they are as full of variety as they are of truth and beauty; and that they form an almost inexhaustible store, from which the landscape-painter, be he artist or be he amateur, may derive materials for enriching his productions. Nor ought we to omit to notice the admirable quality of the lithographic execution. The shadows are distinguished by a happy union of tenderness and spirit, and the lights are more powerfully imparted than we ever before saw them in that rapidly improving style of art.

#### ORIGINAL POETRY.

##### THE STARS.

THREE happy those who still, with faithful eye

Gaze on the stars, and read in them their fate;  
Who stoop not to the earth, and dimly guess  
The future from frail reason, but upturn  
Their soaring thoughts, and in the glittering skies

View with unerring glance man's destiny.  
The student musing in the midnight hour,  
As, through the open casement, on his page  
Beams the bright orb that claims him for its own,

\* For Mr. Schomburgk's paper on the discovery of a new plant, the "Victoria Regina," also read, see our Report of the proceedings of the British Association, p. 583.

Receives new vigour, feels his soul expand,  
And in the rays that centre on his brow  
Traces his distant glory. In the eve,  
The anxious mother and her circling flock,  
Thinking in silence on the absent one,  
Hail with delight the messenger of peace.  
The wand'rer's star, as from the dusky wood  
It slowly rises, silvering o'er the trees  
'Neath which his boyhood sported. In the camp,  
The watchful soldier at his lonely post  
Feels his heart bound, and ev'ry pulse beats high  
When flashes forth his fortune's arbiter  
In proud career, and heralds with its fires  
The morrow's victory. The maiden's breast  
Ceases to doubt the love and constancy  
Of him who, by her side, is floating o'er  
The lake's dark waters, as she sees his star  
Mingling its softened radiance with her own,  
And resting on the bosom of the waves  
In long, unbroken union. The pale  
And careworn widow, mourning for the lost,  
Finds consolation as she nightly views  
The orb, to which is linked her destiny,  
Decline in glory, and, with swift decrease,  
Point to a speedy meeting in the tomb.

August 9, 1837.

RIGEL.

## BIOGRAPHY.

PROFESSOR RITCHIE.

WE are concerned to hear that Dr. Ritchie, Professor of Natural Philosophy and Astronomy at University College, and of Natural and Experimental Philosophy at the Royal Institution, died at Portobello, on the 15th inst., of fever, after a fortnight's illness.

DR. FREDERICK ROSEN.

THIS amiable and accomplished Sanscrit scholar, who was engaged on the MSS. at the British Museum, died rather suddenly. His death was caused, we believe, by an injury received while lifting a quantity of books at the East India House. He was educated at Leipsic, and studied also at Bonn. Professor Rosen was a man of very great acquirements, and did honour to the literature of the age. A native of Germany, he had resided some years in London; and, in connexion with the London University, was extensively known and highly esteemed. He was the friend of Gesenius, and loved by all who knew him. Dr. Rosen died at the early age of thirty-two.

## DRAMA.

**Covent Garden.**—Mr. Macready commences his first season on the 30th of the present month; *The Winter's Tale* is to be the opening piece, and is very highly cast.

**Haymarket.**—Power has been playing every night since our last, and we need hardly add, to bumper houses. He appeared on Wednesday, for the second time, in a new comedy written by himself, and called *Etiquette, or a Wife for a Blunder*, in which, as one of the daily papers says, Mr. Power the author is greatly indebted to Mr. Power the actor! There are several other good parts in this piece, which were intrusted to Strickland, Webster, and Mrs. Humby, but *Captain Denis O'More* is, of course, the most prominent; it was enacted by Power himself, with his usual ability, and was infinitely droll. A further novelty, under the name of the *Queen of the Beggars*, from the pen of Mr. Serle, has, also, been played with success.

**English Opera.**—On Thursday week an excellent little melodrama, entitled *The Highland Cateran*, was transplanted from the Edinburgh theatre, where it has had a considerable run

under the name of *Gilderoy*, to this house, in which we venture to predict it will be equally, if not more, successful. The different parts were admirably played; the *Cateran*, by Brindal, and *Jock Muir*, a Highland herd, by M'Jan, were quite perfect. A broad-sword combat between the latter and Mr. Goadby was much applauded.

Mr. Peake holds out a tempting bill for his benefit, which will wind up, we hope, a prosperous season. On this occasion Mr. Power gives his valuable assistance.

## VARIETIES.

**Anecdote of the late John Constable, Esq. R.A.**—Mr. Constable exhibited, in his general department, the same originality and independence of character which marked the productions of his vigorous pencil, and never permitted the conventional usages of society to restrain him from the free expression of his opinions and feelings. During one of his lectures on the Fine Arts at the Royal Institution, he spoke in very disparaging terms of Berghem. After the lecture, some of the company clustered about the lecturer, for the purpose of having a little conversation with him. "Mr. Constable," observed a nobleman, distinguished by his virtue, "I am sorry you think so meanly of Berghem; for I possess three or four of the finest Berghems in the world. Would you advise me to sell them?" "By no means, my lord," said Mr. Constable, "it would be a dishonest act to sell them." "Well, but what would you advise me to do with them?" asked the peer. "Burn them, my lord," was the painter's prompt reply.

**Extreme Delicacy.**—Mademoiselle Mars was born on the 7th of February, 1779; so that she is now —; but it is invidious to calculate a lady's age.—*Galignani's Messenger.*

**Contrast of the past Season.**—The new Royal Academy Exhibition, in Trafalgar Square, contains 530 feet in length of wall devoted to Oil Pictures; and the number exhibited was 541 Oil Pictures. The Gallery of the Society of British Artists in Suffolk Street, Pall Mall East, contains 575 feet in length of wall devoted to Oil Pictures; and the total number exhibited was 576 Oil Pictures. Thus, the Suffolk Street Gallery contained 35 Oil Pictures more than the new rooms at the Royal Academy. The height of the rooms being similar or nearly so, the average size of the pictures must have been larger in Suffolk Street, since the number of pictures about equal the number of feet of line of wall, whilst those in the Academy exceed the number of feet on their line of wall. The members of the Royal Academy have their galleries given by the nation, and have the royal patronage extended to them in the most exclusive manner, together with all artistical honours, but their rooms are not a mart for pictures for the support and encouragement of art. The Suffolk Street Society built their galleries at their own expense, and are entirely dependant on the patronage of the public: whilst they sell more pictures for the great body of artists than any society in the united kingdom. But it has had no shelter or protection either from royalty or from the government! Is this as it should be?—[*A Correspondent.*]

**Weather-Wisdom.**—We have had improved weather during the week; and yesterday, instead of being cold and rainy, was a beautiful summer's day. The coming week: "The 23d and 24th changeable. The 25th has contradictory testimonies; fair at times, yet cool and changeable. The 27th may bring fair

weather, which, I think, prevails a few days. The end of the month has tokens of high winds—stormy."

**South Pole.**—A French expedition has sailed from Toulon to explore the antarctic regions; and proceed, if possible, beyond the limits of Cook and Weddell.

**Ancient Theatre at Catania.**—From some interesting excavations recently made by M. Sebastian Ittar, there is every reason to believe that this was originally a Greek theatre, rebuilt, with some differences of plan, by the Romans. It is also obvious that marine pieces were performed on real water, as the means for inundation are obvious, and the places for the entrances and exits of the boats, &c. still remain. The pit was a mosaic of marble, granite, and Rosso-antico; and the torso of a faun, part of a dolphin, and other sculptures, were found.

**Indian Coal.**—New mines of coal have recently been discovered at Hanareebang and at Bidgegur, in the south-eastern corner of the Mirzapore district, said to be superior to the coal of Burdwan. This discovery will probably form an important era in the history of steam navigation in India.

## LITERARY NOVELTIES.

We understand that Messrs. Hodgson and Graves are about to commence the publication of twelve of the finest of the Cartoons and Tapestries of Raphael, engraved in Basso Relievo, with Bate's patent Anaglyphograph, by A. R. Freebairn, accompanied by a history of those magnificent works.

A new volume of Sermons, by the Rev. Henry Woodward of Ireland, author of a volume entitled "Essays, Thoughts, and Reflections, and Sermons, on various subjects," is expected to appear shortly.

A Statistical Journal, and Record of Useful Knowledge, is announced for monthly publication, beginning in October.

## LIST OF NEW BOOKS.

Rudiments of Physiology, by the late J. Fletcher, M.D. &c.: edited by R. Lewins, M.D. &c. 8vo. 19s.—*Phys. Thesis*, on the Presence of Air in the Organs of Circulation, by J. R. Wind S.W.  
Generally cloudy, except the 15th, 17th, and 20th; a little rain on the 14th, 16th, and 18th.

Rain fallen, .625 of an inch.

Edmonton. CHARLES HENRY ADAMS.

Latitude... 51° 37' 39" N.  
Longitude... 3 51, W. of Greenwich.

## TO CORRESPONDENTS.

H. D. is probably right; and we hope in due time to lift the bushel off the light. In the mean time it shines very fairly from its dark corner.

We surmise that J. B.'s "Touch on the Times" is rather too political for our pages.

ERRATA.—In our last week's Gazette, p. 580, col. 1, par. 2, for *Cross*, read *Croose*; and in p. 593, col. 2, l. 57, and col. 3, l. 25, for *Adams*, read *Addams*.

## ADVERTISEMENT.

Connected with Literature and the Arts.

**WILL BE SHORTLY CLOSED.**—**DIORAMA, REGENT'S PARK.**—New Exhibition, representing the Interior of the Basilica of St. Paul, near Rome, before and after its Destruction by Fire; and the Village of Alagna, in Piedmont, destroyed by an Avalanche. Both Pictures are painted by Le Chevalier Bouton. Open daily, from Ten till Five.

**KING'S COLLEGE, LONDON.**—**SENIOR DEPARTMENT.**—The Classes in Theology, the Classics, Mathematics, English Literature, and History, under the superintendence of the Principal and Professors, the Rev. T. G. Hall, R. W. Browne, and T. Dale, will be Re-opened on Tuesday, the 3d October.

The Classes for Private Instruction in Hebrew, the Oriental and other Foreign Languages, will recommence on the same day.

**JUNIOR DEPARTMENT.**—The Classes in the School were Re-opened on Tuesday, the 13th instant.

August 26. H. J. ROBE, B.D., President.  
N.B. Chambers are provided for such Students in the Senior or Medical Department, as are desirous of residing in the College.

Albemarle Street, Sept. 1, 1837.

**ROYAL INSTITUTION OF GREAT BRITAIN.**  
The extended and practical Course of Chemical Lectures and Demonstrations, for Medical and General Students, delivered in the Laboratories of this Institution, by Mr. Brande and Mr. Faraday, will commence on Tuesday, the 3d of October, at Nine in the Morning, and be continued on Tuesdays, Thursdays, and Saturdays, at the same Hour.

Two Courses are given during the Season, which will terminate in May.

For a Prospectus of the Lectures, and Terms of Admission, application may be made to Mr. Brande or Mr. Fincher, at the Royal Institution.

JOSEPH FINCHER, Assistant Secretary.

TO ARTISTS, TOURISTS, AND ADMIRERS OF THE FINE ARTS.

**PARLOUR'S PORTABLE SKETCHING-CASE, OR DELINEATOR.** is confidently recommended to the notice of all persons attached to the Science of Drawing, as being infinitely superior to the Camera Lucida, and all other instruments hitherto invented, for the purpose of Sketching. The Sketching-Case may be held in the hand, and a correct Drawing made of any object or landscape; or it may be attached to a table, in the same manner as the Camera Lucida. It is simple in its management, and does not exceed, in size, the common Sketching-Book. Manufactured for the Patentee, by Reeves and Sons, 150 Chancery Lane, London. May be had also, of Smith and Warner, Marlborough Street, Piccadilly; Watkins and Hill, Opticians, Charing Cross; and at all other Opticians' and Artists' Repositories. Ladies and Gentlemen who have the Camera Lucida may have the Delineator affixed to their own stem.

**ST. GEORGE'S HOSPITAL MEDICAL SCHOOL.** Session 1837.

The following Courses of Lectures will be delivered in this School, commencing October 3, 1837.

Theory and Practice of Physic—Dr. Macleod and Dr. Seymour.  
Theory and Practice of Surgery—Mr. Cesar Hawkins and Mr. G. Babington.

Clinical Medicine—Dr. Macleod and Dr. Seymour.  
Clinical Surgery—Sir B. C. Brodie, Bart. Mr. Cesar Hawkins, and Mr. G. Babington.

Maternal Medicine—Dr. Seymour and Dr. Macleod.

Midwifery—Dr. Robert Lee.

Medical Jurisprudence—Hope and Dr. Lep.

Botany—Dr. Robert Dickson.

Anatomy and Physiology—Mr. Tatum and Mr. Henry James Johnson.

Demonstrations of Practical Anatomy, with Dissections—Mr. H. J. Johnson and Mr. Henry Charles Johnson.

Chemistry at the Royal Institution—Mr. Brande and Mr. Faraday.

The Introductory Address on the Opening of the Hospital School for the Session, will be delivered on Monday, October 3d, at One o'Clock, p.m. in the Theatre of the Hospital.

The Anatomical Lectures and Demonstrations are delivered in the Anatomical Theatre in Kinnerton Street, Wilton Place.

Further Particulars and Prospectuses may be obtained by applying to the Porter of the Hospital, to the Porter of the Hospital Museum, or at the Anatomical School in Kinnerton Street.

**TO PARENTS AND GUARDIANS.**—A

Member of the Royal College of Surgeons, and Licentiate of the Apothecaries' Company, who is the Resident Medical Officer of a Public Institution at the West End of the Town, at which there are upwards of Four Thousand Patients annually admitted, would be happy to receive a YOUTH of respectable connections into his Establishment as an APPRENTICE (at an equivalent, but moderate Premium), who would have ample opportunities of acquiring a thorough Knowledge of his Profession during his Apprenticeship, so as to be fully qualified for his Examinations at the College and Hall at its expiration. He would have gratuitous admission to Lectures on Anatomy, Physiology, Pathology, Practical Anatomy and Medicine, Principles and Practice of Medicine, Materia Medica, Principles and Practice of Surgery, Midwifery, Medical Jurisprudence, Chemistry, Pharmacy, and Botany. Every respectable and satisfactory reference will be given and required.

For further Particulars apply, by letter, post-paid, addressed to W. F. 25 Great Quebec Street, Montagu Square.

**THE PUBLISHERS' CIRCULAR.**

At various meetings of Publishers, held at the Chapter Coffee House, it was resolved to publish, on the 1st and 15th of each month, a royal 8vo. Sheet (entitled "the Publishers' Circular," to contain Advertisements connected with Literature, Music, and the Fine Arts. Being liable to the duties charged on a newspaper, it will be stamped, and will circulate free through the Post Office. This List will be sent gratis to a selected (and limited) number of persons, viz. Booksellers, Secretaries of Book Societies, and Private Gentlemen, from whom early applications are requested, the number to be delivered gratis being limited to 3000, after which the price will be 6d. each or 4s. annually. A more detailed Prospectus may be had at any Bookseller's in Town or Country. Any gentleman wishing to receive the List is requested to write to that effect (post-paid) to the Editor, Mr. Sampson Low, care of Wilson and Smith, 25 Skinner Street, London; where Advertisements are received.

The First No. will be published on Monday, October 3.

## SALES BY AUCTION.

adapted for public schools and private tuition."—*Metropolitan*

*Conservative Journal*.

"An admirable dictionary, and promises more help to the

Latin student than any thing hitherto afforded him in this country."

—*Edinburgh Magazine*.

London: Longman and Co.; and J. Murray, Albemarle Street.

## A HISTORY OF BRITISH QUADRUPEDS.

By THOMAS BELL, F.R.S. F.L.S.

Professor of Zoology in King's College, London.

This work is ornamented with nearly 800 beautifully executed Wood Engravings, comprising a Portrait of each Animal, drawn and engraved under the immediate superintendence of the author, and pictorial, as well as other Vignette Illustrations of the Text.

II.

On the 1st of September was published, price 2s. 6d. Part II.

(Part III. November 1st), of a

**History of British Birds.**

By William Yarrell, F.L.S.

Secretary to the Zoological Society.

This work will be completed in 2 vols. 8vo. will contain a great number of British Birds than has yet been included in any work on the same subject: will be illustrated by an Engraving of each Species, executed on wood by Thompson, from drawings made in every practicable instance from living examples of the Birds, and additionally embellished by numerous pictorial and other illustrative Vignettes.

III.

By the same Author,

In 2 vols. 8vo. price 2s. 6d. illustrated by nearly 400 beautiful

Wood Engravings.

**A History of British Fishes.**

This work, which contains a complete history of the Ichthyology of Great Britain, many species never before noticed, is embellished with 240 Figures of Fishes, mostly taken from the objects themselves, and 145 Illustrative Vignettes, drawn and engraved by the most eminent artists; and no pains have been spared to render it worthy of public estimation.

IV.

On the 1st Dec. will be published, uniform with the above three works, and completing the Natural History of the Vertebrate Animals of the British Islands, Part I. price 2s. 6d. of a

**History of British Reptiles.**

By Professor Bell.

"That very beautiful work, the 'History of British Quadrupeds,' drawn to its conclusion, in its kind it is perfect, unequalled in itself, and, as a part of a whole design, still more valuable. Mr. Yarrell, whose 'History of British Fishes' was the first of the series, has now produced No. I. of a 'History of British Birds'; and Mr. Bell, after the completion of his 'History of British Quadrupeds,' will produce a 'History of British Reptiles.' The whole will form a series of illustrations of native Zoology as remarkable for the beauty and fidelity of the graphic portion as for the scientific clearness and fulness of the descriptive part. Of the Fishes we have often spoken with the highest praise; and we have from month to month traced the progress of the Quadrupeds with equal pleasure. To judge from the Number now before us, the Birds will find at least equal justice. They are in the hands of Mr. Thompson, whose specimens of the Falcon family, in this Number, are of extreme beauty. The Peregrine Falcon is a perfect picture in itself. The Fishes are executed with surprising skill; and we are delighted with difficulties overcome; the Quadrupeds afford more scope for the display of art, and the Birds promise a yet more abundant field for the exercise of the artist's talent. Few works possess more claims to attention than those of Mr. Bell and Mr. Yarrell."—*Atlas*, July 15.

A few Copies of the above four Works are also printed in

royal and imperial 8vo.

John Van Voorst, 1 Paternoster Row.

In post 8vo. with Twenty-six Illustrations, price 12s.

**BEAUTIES OF THE COUNTRY;**

Or, Descriptions of Rural Customs, Objects, Scenery,

and the Seasons.

By THOMAS MILLER.

Author of "A Day in the Woods."

"Mr. Miller describes his object to be to embody in his volume whatever is most 'beautiful or poetical in country life and scenery.' All this he has done, and has, also, portrayed with vividness and skill many of the old country customs and festivals. The literary extracts with which his pages are studded, have been gathered with excellent taste from every illustrative of the seasons, both in poetry and prose."—*Examiner*.

John Van Voorst, 1 Paternoster Row.

**THE DESPATCHES, MINUTES, and**

**CORRESPONDENCE OF THE MARQUESS WELLESLEY, K.G.** (Vol. V. completing the work), revised by his Lordship, and Edited by Mr. Montgomery Martin, in this day published, by Messrs. W. H. Allen and Co., Booksellers to the Hon. East India Company.

Of whom may still be had,

**Vols. I., II., III., and IV.**

N.B. This present volume contains an Analytical Index of the whole Work as a Guide for Statesmen, Historians, &c.

Of whom may still be had,

## THE BOOK OF GEMS: 1838.

COMPRISING

SPECIMENS AND ILLUSTRATIONS OF THE MODERN POETS  
AND ARTISTS OF GREAT BRITAIN.

Edited by S. C. HALL.

\* \* This splendid Volume, which has been got up with the greatest care, presents the choicest selections from the works of the celebrated Poets and Artists who have shed such a lustre on the last thirty years. The value of the Poetry and the Paintings having been aided by the selection of the first-rate Engravers, and by the bestowal of every care on the editing and on the typographical portion of the Work, the Publishers trust they have produced a volume which will be unrivalled as a present, both for the elegance of its embellishments, and the intrinsic and unexceptionable nature of its literary and artistic contents.

Succinct Biographies (in most instances from materials furnished by the Authors themselves), and Plates of Autographs, are appended.

## STANFIELD'S SKETCHES.

mercial, and Scientific Survey of the Harbours and Port of  
London, its Docks, Wharfs, Quays, Embankments, Moorings,  
&c.; its Commerce, and its great Resources. By James Elmes,  
Surveyor to the Port, &c. &c. Royal folio; engraved in the best  
style on 10 copper-plates. Price 15s.

Tredgold on the Steam Engine: a new Edi-  
tion, much enlarged, edited by W. S. B. Westhouse, Esq.; with  
an Appendix (A) on Steam Navigation, fully developing that  
very important Science, with Examples of Marine Engines, made  
by the principal makers, and now working in River, Sea, and  
War Vessels; Locomotive Engines; together with an Appendix  
(B) on the Construction, the Naval Architecture, Elementary  
and Practical Principles of Steam Vessels, with Examples, in 30  
large Plates, of Vessels now in Sea and River Service. By J.  
Patten, Surveyor and Naval Architect. The whole forming a  
work of national importance. A large thick 4to., with about 70  
Plates, price 8l. 2s. Appendix (A) and (B) sold separately.

John Weale, Architectural Library, 30 High Holborn.  
\* \* Mr. Weale would be very thankful to receive Communi-  
cations upon the subjects of Locomotive Steam Power, and upon  
Steam Navigation. Post letters will immediately be attended to.

With a Map of Routes, post 8vo. 9s. 6d.

### REVIEW OF NEW BOOKS.

*The Despatches, Minutes, and Correspondence of the Marquess of Wellesley, K.G., during his Administration in India.* Edited by Montgomery Martin. Vol. V. London, 1837. Allen and Co.

THIS supplementary volume completes one of the most valuable and remarkable works of our time. It is remarkable as the history of a most remarkable period, and of a most remarkable man. Ordinary events and ordinary men seem to go together; they act from precedent, and for a little while every thing proceeds with the most quiet regularity. Suddenly unlooked-for events alter the whole face of affairs; nothing is as it was; change becomes indispensable; yet no one is prepared for that change; all is hesitation and fear, for there is the emergency; but who is to meet it? It is at such an epoch that the full value of a man like the Marquess of Wellesley is felt. The history of his rule in India is the history of a master mind, commanding and foreseeing, ready for every difficulty, and encountering obstacles only to overcome them. How accurate was his estimate of the crooked policy of Tippoo Sultan! how borne out by the correspondence now before us! One thing cannot but strike even the most careless reader of these pages, which is, that let the subject be what it will, how entire and comprehensive is the view taken of it by the Marquess of Wellesley; at once profound in its analysis and extensive in its bearings. Another merit, one which a literary journal cannot but appreciate, is the admirable style: any one of these letters might be taken for a model in composition. Many of the subjects which these despatches illustrate require far more space than our columns can give to their discussion. We, however, select one which bears immediately upon a subject now the matter of public discussion, namely, the communication with the Red Sea.

“Previously to the mission of Captain Wilson from Bombay, no intercourse of a political nature extending beyond the interchange of complimentary letters, had subsisted between the British government in India and the Arabian states. The extent of the trade between Arabia and the ports of India has for many years been inconsiderable. The British government in India being thus entirely unconnected with the states of Arabia, has possessed no opportunity of acquiring an intimate knowledge of the political relations, or of the commercial interests, of those states: I am not, therefore, prepared to enter into a detail of the particular concessions, either of a political or of a commercial nature, which any of the states of Arabia would be disposed to receive, or which I should be inclined to afford, in return for the important advantages which it is our object to attain. The information which you will acquire after your return to the Red Sea, will enable you to ascertain in what manner a political connexion with the British government in India may be rendered conducive to the interests of any or of all the Arabian states, and what engagements of a commercial nature would be calculated to ensure any essential advantages to the commercial interests of those countries. At present I must content myself

with soliciting your attention to the general considerations which appear to me to affect this part of the question. The promise of our protection against any attempt on the part of France to violate the independence of the Arab states might be deemed an advantage, for which those states would be disposed to pay a valuable consideration. But if the British arms should be completely successful in effecting the expulsion of the French from Egypt, any apprehension which the Arab chiefs may hitherto have entertained of the future attempts of France may have ceased. It may, therefore, be advisable that you should endeavour to remove any such sentiments of false security, and to excite in the Arab chiefs a solicitude to obtain the protection of the British power against France. Such an offer on our part may lead to correspondent concessions on the part of the Arabs. It may be suggested that, although the favourite project of France to effect a permanent establishment in Egypt, and to extend her dominion over the countries adjacent to the Arabian Gulf, has been happily frustrated by the power and skill of the British army, the French will not, therefore, be induced to abandon this primary object of their ambition. Frustrated in their attempts to maintain themselves in Egypt, they may hereafter resume the enterprise which they have frequently formed of making a descent on the coasts of the Red Sea; in this event, that part of the coast which is under the dominion of the Imaum of Senna will probably become the first point of attack. It is, therefore, the interest of the Imaum to provide, in the most effectual manner, for the possibility of this event, by cultivating a connexion with the British power, and by securing the co-operation of the British arms. While the British power shall hold Egypt, although no immediate danger may be apprehended by the Arab chiefs from any designs of France, it must be an object of the policy of those chiefs to cultivate the favour of a power which has possessed itself of Egypt, under every circumstance calculated to inspire confidence in its good faith, and respect for its vigour, energy, and military skill. Even after the British army shall have evacuated Egypt, and shall have delivered it over to the porte (if such an adjustment shall be the termination of the war in Egypt), it may be expected that the fame and character of the British empire will be so elevated in that quarter of the globe, as to render the chiefs of Arabia and all the neighbouring states desirous of improving their relations with our government, and of entering with us into political and commercial engagements, founded on liberal and just principles of mutual interest and security. Should the political situation of the government of Senna, or the condition of its internal affairs, or that of any Arab state in the gulf, be such as to expose the Imaum or chief to the hazard of external attack or internal commotion, this state of circumstances will afford an additional ground for the conclusion of defensive engagements. Whatever exigency may induce the Imaum or chief to desire the protection of the British power, will facilitate the attainment of the primary objects of your mis-

sion. In offering these suggestions, however, it is proper to state my decided opinion, that we should abstain from any mixture in such political intrigues as may be connected with any design of subverting the established government, of effecting revolutions in the state, or of endangering the life or power of any reigning chieftain. The symptoms of such a disposition on our part, would tend to create jealousies and suspicions, of which the effect might be felt beyond the limits of any interest which we might hope to establish in Arabia, while all our views in that quarter would certainly be defeated by the unjustifiable means employed to accomplish them. This observation applies peculiarly to Mecca, where the state of the present shereef's power renders it more especially necessary to use every degree of caution with regard to any interference in the internal affairs of the country. The co-operation of a British force, or of any public officer of the British government, in any revolution at Mecca, would undoubtedly create the strongest sentiments of indignation and disgust in the mind of the grand signior, and would irritate every mussulman state in India. You will observe from the preceding remarks, that in my judgment the first general proposition from the offer of which we may expect to derive concessions of the nature desired by the secret committee, from the chiefs of Arabia, is the engagement to afford the protection and countenance of the British power to the established governments of those countries. The nature and extent of the protection to be offered to those chiefs from the government of India, must be left to your discretion, subjecting any engagement which you may conclude to the ratification of the governor-general in council. In concluding any treaty of a subsidiary or defensive nature, you will endeavour to limit the guarantee to the case of an attack from France, and in no case will you enter into engagements to protect any Arab state against the authority of the Ottoman porte. The particular concessions of a commercial nature, which it may be the wish of the Imaum of Senna or of any Arab chief to obtain, and which it may be consistent with the commercial interests of the Company to grant, cannot be precisely ascertained, without a more perfect knowledge than we at present possess of the nature and extent of the trade between Senna, the Arabian Gulf generally, and the ports of India. I am disposed to grant considerable privileges and immunities in favour of Arabian ships and merchants frequenting the British ports in India; to abate or relinquish the duties upon imports from that country; and to engage to take a certain quantity of coffee, the staple commodity of Senna, annually; to allow the Arabian merchants to export from the ports of India to Arabia, to a certain extent, any of the articles, the produce of the British empire in India, of which the export from India is now prohibited; to supply the Imaum, or any other Arab power, with broad cloth, iron, &c. the produce or manufacture of Europe, and with military and naval stores; to supply the Arab powers with ship-builders, or to construct ships for them in our docks, the

imaum or chief defraying the actual cost. You will be guided by your own judgment and discretion, and by the actual state of circumstances, in applying these general suggestions, which are applicable not only to Senna, but to all other Arab states on the coasts of the Red Sea. Whatever commercial engagements you may contract with the Imaum of Senna, or with any other of the Arab states, will be subject to the ratification of the governor-general in council. Whatever be the relation which the states of Arabia may bear towards the porte, I deem it highly expedient that his majesty's ambassador at the court of Constantinople should be enabled eventually to communicate to the grand signior the object, extent, and progress of your negotiations with the chiefs of Arabia; I shall, therefore, transmit a copy of this despatch to the Earl of Elgin, by the present overland despatch, and I request that you will avail yourself of every opportunity to communicate to his lordship the progress of your negotiation. With regard to the mode of conducting the negotiations intrusted to your charge, I am of opinion that you should be careful to impress the minds of the several chiefs of Arabia with due respect for the dignity of your situation, as the representative of the British nation; a character which, in my judgment, entitles you to claim the privilege of negotiating upon terms of equality with the Imaum of Senna, the Sherreef of Mecca, or any of the Arab chiefs. I am apprehensive that your proceeding in person to Senna, or to the residence of any chief in Arabia, situated in the interior of the country, might tend to lessen the importance of your character in the opinion of the Arabs, and might, therefore, prove injurious to the success of the negotiation. My judgment on this question arises from the knowledge that the several chieftains of Arabia, however independent with respect to power and authority, are considered to be officers of the Turkish empire, and to derive their rank and appointments from the grand signior. They are not, therefore, to be acknowledged as sovereign princes; any such acknowledgment on your part (according to the uniform disposition and character of every Eastern court), would infallibly weaken your influence, and increase the insolence and arrogance of the power with which you are to negotiate. Unless, therefore, the Imaum of Senna, or his minister, should proceed to Mocha, or unless a personal meeting with the Imaum should appear to you to be expedient—in which case you might require that the Imaum should leave his capital, and should advance a considerable way for the purpose of meeting you—I would recommend it to you to conduct your negotiation through the channel of a secretary to your mission. The Eastern nations are so much influenced by exterior forms, that the greatest attention is requisite to points of ceremony and appearance. Any concessions in points of that nature on the part of an ambassador to an Eastern court, tend to degrade his consequence and to impede the progress of his negotiation. It appears to me, therefore, to be extremely desirable that one of the Company's civil servants, whose talents and general knowledge, especially of the Arabic and Persian languages, may qualify him for the situation of secretary to your embassy, should accompany you in that capacity; and I have accordingly written to the vice-president on that subject, to whom I have the honour to refer you for further details relative to the selection of your secretary. If you should deem the services of Mr. Robertson, whom you have appointed to act as your secre-

tary, to be necessary to the despatch of the affairs of your mission, he may be employed in the capacity of assistant to the secretary to your mission, the latter being a civil servant of the Company. I hereby confirm the temporary appointment of Mr. Robertson in the office in which you have employed him, referring you to the vice-president in council for the scale on which his allowances are to be paid on account of the services which he has already performed, as well as for that by which his future salary is to be regulated, if you shall find it necessary to employ him in the capacity of assistant to your secretary."

Great changes have taken place since the above instructions were penned, but the staple of their truth remains. There has been so much popular misunderstanding about Lord Clive, and so *avant* a measure of justice awarded to his singular and distinguished career, that we cannot but quote the following noble letter:

*Lord Clive to the Marquess Wellesley.*

"Fort St. George, 3d September, 1803.

[Received 25th September.]

"My dear Lord, — The generous and affectionate expressions conveyed to me in your lordship's letter of the 4th ultimo, upon subjects intimately connected with my reputation, and nearly touching the feelings of my mind, have penetrated me with sentiments of the sincerest regard, gratitude, and respect. Had not your lordship's former communications, the consideration of the important crisis of affairs, both in India and in Europe, and my own judgment, confirmed by the whole course of my observation upon events and proceedings at this place, anticipated in my mind the indispensable necessity of my continuing in the exercise of the authority of the government of Fort St. George, under any circumstances that might have occurred, until the arrival of Lord William Bentinck should enable me to relieve myself from that arduous and important charge; the decided expression of your lordship's judgment and wishes contained in your despatch of the fourth ultimo, could have left no doubt of the determination which it would have become me to adopt and pursue; I feel, therefore, great satisfaction in having afforded this last proof of my obedience to your lordship's commands, and I congratulate your lordship with sincere pleasure on the opportunities at length afforded me of transferring the charge of this government to the honourable hands appointed to receive that trust. Your lordship's intention of passing your solemn and public judgment in council upon the subject of my administration, is matter of much consolation to the feelings of my mind; and I am truly grateful for the great kindness of your lordship in desiring me to point out the mode of fulfilling that intention which may be most satisfactory to me. The circumstances in which I have been placed by the extraordinary procedure of the Court of Directors have compelled me to discussions relative to the administration of the internal affairs of this presidency, which have completely laid open to that honourable court, and to your excellency, the motives, progress, execution, and result, of all the principal acts of my government. These details are minutely described in my several despatches to the honourable court; and, feeling a well-grounded confidence that the judgments recently pronounced by that body, under the impression of a passionate view of my administration, will yield to the evidence of my success in the improvement of the affairs of the East India Company on the Peninsula: my anxiety on this subject is entirely relieved by a just assurance that your lordship, in pass-

ing a formal judgment on my government, will pursue that course which, under a more general view of this important question than I am competent to form, may be best calculated to secure the stability, prosperity, and honour, of the empire in India, on principles of enlarged and national policy. On your lordship's superior judgment, therefore, on your intimate knowledge of the acts of my government, and of the principles which have guided the conduct of my administration, and on the dignified and fervent friendship of your lordship, the result of our cordial union and co-operation for the attainment of the most important public objects, I entirely wish to rely, not only for the fairest and most enlightened decision on the merits and character of my administration, which it may be capable of receiving, but also for the mode which may render that decision most impressive and convincing. In order to complete the documents in your lordship's possession respecting my administration, I do myself the honour to enclose the concluding minute by which I formally resigned the government of Fort St. George into the hands of Lord William Bentinck; and I trust that the points which I have endeavoured to impress on the attention of my successor will be deemed by your excellency to be conformable to the system of your lordship's policy for this presidency in the actual situation of its affairs. I have the satisfaction to add, that I think it of importance to state, that the public accounts completed since the date of my minute, exhibit a material improvement of the public revenue beyond the amount at which it has been stated and estimated in the documents officially submitted to your excellency in council, in the past as well as in the current revenue. I am extremely sensible to the kindness of your lordship's invitation to Bengal. The contemplation of the personal satisfaction and advantage which I should derive from the society of your lordship, and from the communication of your sentiments upon the important objects which have so long engaged our joint attention, as well as the peculiar interest with which the scenes and improvements in Bengal could not fail to affect my mind, would hold out inducements not to be resisted, did not the extraordinary circumstances in which I have been placed, and the length of time during which I have deferred my departure for the avowed and sole purpose, now accomplished, of resigning into the hands of my successor the government of Fort St. George, render it most consistent and necessary that I should embrace the earliest means after the accomplishment of that event, of repairing to England. It is, accordingly, my intention to embark the moment the ships are ready for sea, which cannot, I believe, now exceed four or five days. It is impossible for me to contemplate my approaching separation from your lordship's labours, without reviving in my mind all those sentiments of gratitude and attachment which have been excited by your lordship's uniform friendship, support, and advice; nor without renewing to your lordship the assurance of my most fervent esteem, respect, and affection. I look not without anxiety, but with a confident expectation of success, to the termination of your lordship's present contest with the Mah-ratta chieftains; and when your lordship shall have added that trophy to the brilliant career of your achievements, I trust that the national policy will have been sufficiently matured to call upon your lordship for the only means of preserving, by the wisdom and firmness of your councils at home, the great empire which has been extended and consolidated by the vigour

and success of your lordship's administration abroad.—I have the honour to be, &c.

"CLIVE."

We cannot conclude without a brief tribute to the merits of the editor, Mr. Montgomery Martin. His industry and his research are unrivalled: he has brought forward subjects long and wonderfully neglected; and no writer has contributed so much to the public stock of most requisite and important knowledge.

*An Essay on the Roman Denarius and English Silver Penny, shewing their Derivation from the Greek Drachma of Ægina, &c. &c.* By W. Till, Medallist. 12mo. pp. 230. London, 1837. Till.

THIS desultory volume, without any of the craft of authorship, contains much practical information on the subject of which it treats. The medal collector will find it a very useful guide; and even the general reader may gather amusement and intelligence from its varied pages. As a sample of this, we may quote a few passages which bear on interesting historical points.

"Contemporary with the coins struck by the Saxon monarchs, are those found in Ireland, having for a legend straight strokes, instead of letters. A very considerable number of these coins have recently been discovered, and the major part of them brought to London, being all of one type; presenting, on the obverse, a very rude head with a cross; and, on the reverse, a cross. They are evidently prelatial, and though heretofore known, are still unpublished. Pennies of the kings of Dublin are also found, with the superscribed title and the name added. We meet with those of Sithric, Dymnroe, Idnidrid, Stired, &c. Our Saxon kings, Eadgar, Ethelred, Edred, and Anlaf, struck pennies in Ireland, the first of these monarchs having conquered that country. The pennies, as before stated, were the chief coins circulated by the aforesaid sovereigns and prelates; the sees of Canterbury and of York having the privilege of striking them. Coins, also, of the penny size, are sometimes seen bearing what indicates neither an English or Irish origin, while their locality identifies them with the British Isles; and it is presumed that these coins are either Danish, or were struck by sovereigns whose sway extended to the Isle of Man, being frequently found there. They bear, on the obverse, a rude head; reverse, a cross, &c. very similar to our early English pennies at the commencement of the twelfth century. William, the usurper and conqueror of England, A. D. 1066, fearing the consequences of too frequently reminding his new subjects of their degradation and fallen state, took especial care to strike his penny on the model of that of his predecessor, Harold II. The Conqueror's portrait, however, as far as the inferior work can perpetuate it, is faithfully delineated, being that of a merciless and rapacious tyrant. On some of his coins he appears in profile, and on others full faced, with and without a sceptre, or a cross ornamented. The pennies of the Conqueror are all rare, if we except the Pax type, which, from being extremely scarce, have now become very common, from the circumstance of an abundance of them being found at Beaworth, near Winchester. This discovery has furnished us with a new type, before unknown—that of having the portrait in profile to the left, instead of full faced, as heretofore, with Pax on the reverse. The canopy type of the sovereign still continues very scarce."

Mr. Till goes on describing the pennies of

the succeeding reigns, and we come to one of considerable interest.

"Richard I., A.D. 1189. We now come to a break in the English series. Of this monarch we obtain no English coins. Richard Cœur de Lion was only eight months in Britain during his reign: to this circumstance, probably, we may attribute the want of his coinage. Snelling, an admirable writer on English coins, but unfortunately for his credit as a judge of medals, has engraved two, as being found with others near Leeds, in Yorkshire. But he was deceived. A person of his day fabricated them, and thereby gained a disgraceful notoriety by his trickery. Folkes and Ruding have perpetuated this blunder, by likewise engraving them. The latter, indeed, is excused, as he not only alludes to them as being false, but was obliged to publish them, having the loan of the original plates of Folkes, in order to embellish his own work. Rapin gives a penny of Edward the Confessor, struck at York, as one of this sovereign, and by some unaccountable mistake, has made it read 'RICARD,' instead of 'EADPARD.' Another penny, assigned by the same author to Richard I., and engraved in page 258, is not of this king. Speed has made the same blunder, by assigning the same coins to Richard. That the heavy sum paid by his subjects for his ransom (to the eternal disgrace of the emperor, Henry VI.) should have taken all his coins out of the country, had there been any, is a truly ridiculous supposition. For had the monarch in question issued even but a few coins, no human power could have so traced them, as to leave none in the kingdom for future discovery. And there are those in every age whose curiosity nothing can repress. I will, therefore, fearlessly assert, that the absence of all English coins of a sovereign so much beloved as Richard Cœur de Lion, can only be attributed to one cause—namely, their primitive non-existence. Nor was this ransom paid in coin, but with one hundred and fifty thousand marks in weight of fine silver. If, therefore, the reader is desirous of possessing a coin of Richard I., he must procure one struck in that monarch's paternal dominions of Aquitaine and Poitou, a coin nearly the size of the English penny, but of base silver, and without portrait. Such coins are termed Anglo-Gallic: they are extremely rare. John, A.D. 1199, struck no coins in England (at least none have been discovered). This circumstance is the more singular, as, according to the records, we find he had various places of mintage in this country. He struck his pennies and other coins in Ireland: the former alone I allude to. His portrait on the obverse, is full faced within a triangle, surrounded by his name and title, and in his right hand is a sceptre. On the reverse is a similar triangle enclosing a crescent and a star. The pennies of this king are rather scarce."

These extracts will shew the character of this part of the volume. Mr. Till then gives us a good list of books of reference on coinage, &c.; some remarks on Queen Anne's farthings; a Report of the proceedings of the Numismatic Society, recently formed; and a sketch of the Battle of Barnet.

With regard to the Numismatic Society, though the *Literary Gazette* has contained notices of its sittings, we shall copy two more detailed reports of the author on subjects of curious value. At one of the meetings, he says, "I embraced the opportunity of placing before the members, a cast from an unique gold medal, or pattern-piece of Charles the First. This extraordinary piece is in the possession of Lieut-

Colonel John Drummond; indeed, it was at my suggestion that he recently purchased it of the Rev. Mr. Commeline, Senior Fellow of St. John's College, Cambridge. This gentleman is a collateral descendant of Bishop Juxon, who attended the unfortunate monarch in his last moments. It appears that at that eventful period, the king possessed the jewel of the order of the garter, and another diamond, and two seals; and previously, or at the time just referred to, this identical medal, which his majesty presented to Bishop Juxon, as a mark of regard for the attention and attachment the bishop had shewn him. There appears to be a tradition in Mr. Commeline's family, that it was given by the king to the bishop while the monarch was on the scaffold; but this statement may be doubtful. Sir George Chetwynd, Bart. is descended from Elizabeth Juxon, a niece of the bishop, and who possessed the original jewel of the order of the garter, which all authorities acknowledge was given by the king only a few moments previous to his death; and Sir George informs me, that he has heard his father likewise state, from tradition, that the garter alone was given on the scaffold. Be that as it may, it cannot increase or diminish the value and interest attached to this medallion memorial. That it came from the king is certain, and that it was given to the bishop is likewise certain, for he by will bequeathed it to Mrs. Rachel Gayters, who gave it to her granddaughter, the wife of the Rev. James Commeline, who was father of the present rector of Red Marley, Worcestershire, of whom Colonel Drummond purchased it. This curious medal bears on the obverse the bust of the king, with his name and title, and with the rose as a mint mark; the likeness is very good, but it cannot compete with the likenesses executed by Briot, from the original portraits of that sovereign by Vandye: that on the coin in question is doubtless the work of Rawlins, an artist who followed the fortunes of his royal master, and was subsequently employed by Charles the Second. He executed that very rare crown-piece, struck at Oxford, and having that city represented under the horse on which the king is seated. If the medal under consideration, be compared with this coin, the portrait of Charles will be found to be exactly similar on both pieces, though a slight difference is perceptible in the costume; still, the workmanship of both is evidently traceable to the same hand. On the reverse are the arms of England, crowned with C. R. &c., and accompanied by the legend, 'Florent Concordiæ Regna,' (kingdoms flourish by concord), doubtless, in admonitory allusion to the unsettled state of the times: this side likewise bears a mint-mark. It may be asked for what purpose was it struck; was it intended for a coin or a medal? I reply, without fear of contradiction, that it was meant as a pattern for a coin, or else, for what reason are the mint marks? The coin weighs 733 grains, and has what is termed an engraved edge, but it is not milled. There is a twenty-shilling piece in gold, very similar in appearance, having for the mint-mark an anchor, and the king's titles more abbreviated."

At a subsequent meeting, "the secretary read a very curious and interesting letter on certain ancient coins of the Chinese empire, called knife coins, from the pen of a member of the society, Mr. Samuel Birch, a gentleman who, it appears, has paid the greatest attention to the currency of the celestial empire; and, if we may judge from the abstruse nature of his communication, it will be long before he finds

a compeer in the field which he has made his own, and has so successfully explored. The following is the substance of his communication, "which," says Mr. Till, "I gathered from taking notes at the time :—

"The sulphur impression, now offered to the gentlemen present, is from a fragment of a *taou*, or knife-coin of the Chinese, in the British Museum. It is of brass, or bell-metal, exhibiting a light brown bronze appearance on the exterior, and an iron-coloured granulation at the edge of the fracture, consisting of a perforated ring, and the upper portion of a fluted blade. Knives appear at an early epoch to have been worn by the various Tartar hordes, who thus characterise themselves, in the language of the tragedian—'The wild chase is our trade, battle and conquest our chief occupation.' They were worn attached to the girdle; for, in a juvenile Chinese Encyclopædia, a stanza of the *Kooloo-foo* poem is quoted, in which a wife thus deplores the absence of her husband :—

'Oh, my husband! where art thou  
Beyond yon hills, which tower o'er each other?  
Shall I hear the head of your great knife,  
When the moon, like a rent mirror, ascends the heaven?'

The commentary explains the head of the great knife, as the ring by which this instrument was attached to the girdle, producing a clinking noise, and forewarning the approach of the wearer. The 'Istoria Relazione del gran Regna della Cina' of P. Alvaro Semedo, in its narration, mentions, among the presents made by the Mahomedan ambassadors to the Chinese throne, '600 knives and as many files; and the narrator continues, 'this last present appearing to me very extraordinary to offer to a monarch, I inquired what use the king made of them, and found none who could tell me; but a certain captain alone said, 'That it was a very ancient custom, and so strictly observed, that no substitution was allowed.' The use of knives as coins is of a far earlier epoch, and the reason of this feudal right being demanded in the seventeenth century, probably had reference to that haughty arrogance of the Chinese court, which regards all other monarchs as its vassals. 'The 'Chin-paou,' a tract upon precious things embodied in the *San-tsao-too-hwuy*, contains an account of the early currency. It appears from this tract, that the knife-coin was the actual adaptation of this shape to the currency, and its accounts relative to these coins are as follow :— Ancient knives used under the former monarchs in the same way as silks and gems. Gold knife of the emperor Wangmang, A.D. 10 : perpendicular inscription on the seal character, 'one knife equal to 5000.' Knife of unnamed material, coined by the same monarch : perpendicular inscription in the seal character, 'legal knife 500.' Knife found in the fifth year of Suenho, in a field near Kinheén, a village of Munching, with a perpendicular inscription in an old court hand, 'heart-shaped spoon currency 500.' Silver knife, with an illegible inscription, found by Wangkung, a high literary officer in Kinchown : uncertain whether cast under the Kewfoo. Hagar, in his 'Numismatique Chinoise,' gives a drawing of a Chinese knife-coin quite perfect, belonging to the French Museum, probably remitted by P. Amiot from Peking; and the great rarity of these coins may be inferred from the fact of none belonging to the collection of Mr. Marsden, who had every facility for acquiring them.' Probably no coins in the world are less intellectual or interesting than those issued by the Chinese, who, notwithstanding the insulting presumption for which they are notorious, are immeasurably behind all other civilised nations in the art of mintage."

*Illustrations of Jerusalem and Mount Sinai; including the most interesting Sites between Grand Cairo and Beirout.* From Drawings by F. Arundale, Architect. With a descriptive Account of his Tour and Residence in those remarkable Countries, 4to. pp. 116. London, 1837. Colburn.

"THE circumstance of Syria being under the dominion of the Turks," observes Mr. Arundale, "the little facility or accommodation afforded to the European traveller—the want of those luxuries which (forgetting the difference of climate) the English stranger fancies necessities, and the fatiguing slowness of the travelling, over a mountainous country, where the roads are not improved by art, demand great moral, as well as physical courage, to endure the constant vexations and privations that await the traveller. But so numerous are the reasons by which many might be deterred who anxiously wish to visit this interesting country, that it would be needless to cite them; to such I beg to submit the following views, as facsimiles of sketches taken on the spot. The eye of the painter will doubtless see in them much that might be improved; as, in the descriptions, the poet might embellish many of the scenes. The simple narrative of the events of each day, with the opinions of various celebrated travellers on the objects and places connected with sacred history, interspersed with a few historical data, interesting to every reader who peruses the description of a country and city 'once the joy of the whole earth,' but deprived of all its former splendour, with now 'not one stone left upon another,' is all that is offered to the reader in these pages. This, it is to be hoped, may give interest to the views; and the views may serve, in their turn, to illustrate more clearly, and make amends for any deficiency in the description."

The views, which are above twenty in number, are pleasingly executed in lithography, and have the simplicity and truth by which all topographical drawings should be distinguished. It is not in such works that we wish to see fidelity of representation sacrificed (as it too frequently is sacrificed) to picturesque effect. This remark is peculiarly applicable to scenes which associations, derived from our earliest youth, invest with a sanctity, that makes us feel any attempt to disguise or alter their actual features to be a kind of profanation.

With respect to the descriptive portion of the volume, although certainly, as Mr. Arundale himself modestly admits, it does not add much "to the treasures of information already accumulated respecting what may be called the scholastic, or antiquarian views of this wonderful and sacred land," we have no doubt that, as he asserts, it will prove "serviceable as a guide to the future traveller, who, the author trusts, after passing the same route, will be enabled to bear witness to its correctness." We will quote two or three of the most interesting passages from Mr. Arundale's narrative. And first, his account of the Dead Sea :—

"After remaining here (the banks of the Jordan) an hour, we proceeded towards the Dead Sea. Our path lay over loose ground, strongly impregnated with salt; so rotten, indeed, was the soil, that the horses sank nearly up to their knees at every step. After toiling slowly along for an hour and a half, we arrived at the shore of the Dead Sea. An immense quantity of timber of various sizes encumbered the space between the water's edge and the line of a previous inundation. Our first impulse was to ascertain the truth or falsehood of the innumerable and wonderful peculiarities which

we had heard these waters possessed; we immediately waded in, and were delighted to find the marvellous relations respecting the unusual power of buoyancy completely verified. This was sufficient entirely to support our weight, without the slightest exertion of strength or skill. The peculiarity of these waters has been much exaggerated, both in ancient and comparatively modern times. Pliny asserts that living bodies could not sink in it; and Strabo affirms that it supports a man as high as the middle. Vespasian, according to Josephus, caused some persons who were unable to swim to be thrown in with their hands tied, but they all floated. Maundrell tried it; and confirms the fact of the extraordinary buoyancy, but, of course, not the extent asserted by the ancients. Pococke adds his testimony to the power with which he was supported, though, as he says, he remained in the shallow parts near the bank, without venturing far into the deeps, where, in all probability, the effect would be still more powerful. There is a vulgar notion among the Arabs, that the water would consume the body of any person rash enough to attempt to swim across; nor is this supposed burning property obnoxious to human flesh alone, but to wood and iron; for they say, that the same would happen to boats, of which there is not one on the lake. The only traveller of any late period who does not confirm the extreme buoyancy of the water, is Mr. Jolliffe, who describes it as but little more dense than that of the sea generally. That gentleman, however, was prevented, by the impatience of the Arabs, from going any distance from the shore; and the beach slopes so gradually, that it is necessary to wade an hundred yards and upwards to go out of one's depth. We found the water as bitter, and as painful to the eyes, as it is generally reported to be. Numerous chemists have analysed this water, and have given different, and, in some cases, inconsistent proportions of its ingredient parts. The investigation, however, carried on by the accurate Dr. Marcet, is, I believe, published in the Philosophical Transactions of 1807. He determines the specific gravity of this fluid to be 1211, which bears to the specific gravity of water the proportion of 1211 : 1000. This density is greater than that of any water which is produced by natural means. His analysis is as follows. The proportions are taken to 100 grains of the water :—

	Grains.
Muriate of Lime .....	3.42
Muriate of Magnesia .....	10.246
Muriate of Soda .....	10.35
Sulphate of Lime .....	.054
Sum .....	24.08

Thus, this singular water contains nearly one-fourth of its weight in salt. The conjectures made for the purpose of reconciling the present appearance and singular peculiarities of this wonderful collection of water, with the scriptural account of its origin, are many and ingenious. No reason can be given for the excess of saline matter in its composition, but that which refers to this account. Chateaubriand deprecates, and with apparent reason, the supposition that this basin is the crater of an extinct volcano. This, he says, has none of the distinctive and universal peculiarities which he had observed in Vesuvius, Solfaterra, Monte Nuovo, the Peak of the Azores, the Mamalif, opposite to Carthage, &c., in all of which 'I observed,' he says, 'the same characters, that is to say, mountains excavated in the form of a funnel, lava, and ashes, which exhibited incontestable proofs of the agency of fire.' This traveller seems inclined to agree in the ingenious conjecture of Michaelis, who supposes

that Sodom and Gomorrah were built on a mine of bitumen, into which, when blazing from the effect of lightning, the fated cities sank. There is another most acute conjecture of a French philosopher, M. Malte Brun, I believe, that the walls of these cities were themselves constructed with bituminous stone, and ignited by fire from heaven. The Mosaic account, too, Gen. xiv. 3, 10—'All these were joined together in the vale of Siddim, which is the salt sea.' 'Now the vale of Siddim was full of slime pits.' This bitumen is found in great abundance in the lake, from the bottom of which it rises in large masses to the surface, where it explodes with a great deal of smoke. The black fetid limestone, of which there is doubtless an immense stratum, gives, on burning, the true bituminous smell. The fetor of it is to be attributed to an impregnation of sulphureted hydrogen. The bitumen of the lake, which is more plentiful after high winds, is collected by the Arabs, and from the most ancient periods has been sold for medical purposes. The monks of the Latin Convent at Jerusalem keep quantities of the water and the bitumen of the Dead Sea in jars, and highly esteem it as an article of pharmacy. Pliny's assertion, that it was used by the Egyptians in the preparation of their mummies, has been repeatedly confirmed by the subsequent examination of those singular remains. It being dangerous, however, and heterodox, to sit down satisfied with a natural explanation of a phenomenon which we are expressly told, Gen. xix. 24, was produced by miraculous agency, we may easily suppose that the 'shower of brimstone and fire from heaven' was accompanied by a volcanic or bituminous eruption from the vast storehouse of inflammable and explosive matter which is undoubtedly accumulated beneath the soil. In fact, to add confirmation to this supposition, all travellers have united in describing the immense quantity of nitre in the neighbouring hills, which, by the aid of a thunder-storm, might readily be conceived the instruments of the terrible vengeance of Heaven."

Mr. Arundale's description of the town of Nazareth (now pronounced Nazzara) contains some curious matter:—

"Immediately on our arrival at this memorable town, we proceeded to the Latin Convent, which is situated on the eastern side. On presenting ourselves, we were received by one of the fathers with great distrust and dislike, as he took us for 'Turks'; nor were his suspicions destroyed by our assurances of our real character of English travellers. An interview, however, with the superior set all right again, and from him we received every attention. The continuance of the bad weather, and the state of the roads, which were impassable from the swollen streams, gave us full leisure to examine Nazareth, by confining us for three days,—a period for investigating the antiquities, rather too long for the interest believed to be attached to them. The great curiosity (with the usual miraculous legend attached to it) are two granite columns, standing in front of the altar of the church, which the monks assert occupy the identical spots which the Virgin and the angel occupied at the Annunciation. The column of the Virgin has been broken away at the bottom, in such a manner that the shaft remains suspended from the roof. This is deemed miraculous, and, of course, undeniably proves the authenticity of the holy spot; for you are told that the pillar cannot be supported in any way. There can, however, be no doubt as to the nature of its attachment to the roof. On inquir-

ing how long the column had so remained, we received the characteristic answer, 'Ever since the time of the Annunciation!' This broken column bears the reputation of healing all kinds of diseases, though a railing which surrounds it proves that the fear of infection has been stronger than superstitious reverence. The Latin Convent is a spacious and convenient building, which has been repaired about a century ago. The ancient structure is supposed to have been the work of the Empress Helena, to whom may be ascribed so many of the convents and churches in the Holy Land. A good number of fragments of columns, capitals, &c., shew tolerably well the style of architecture, which differed but little from other structures of the same date. Within the convent we were shewn the house of Joseph and Mary, and a cavern, divided into several compartments, to which are attached the titles of the parlour, bed-room, and kitchen of the Mother of Jesus; and here the greatest miracle was related, namely, the flight of the Holy House to Loreto; to confirm my belief in which, the monks shewed me the place from which it was removed. From the apparent sincerity of the monks, the openness of their manners, and the simplicity with which they related their miracles, I have no doubt that these good fathers most implicitly believed the truth of what they related. This impression was agreeable, after having witnessed the knavery of so many friars, in relating, without a blush, miraculous accounts, of which it was quite impossible they could believe a single syllable. The house of Joseph and Mary occupies, in length, nearly the breadth of the church, the interior of which, as well as the columns, are tapestried with rich silk, which produces a glowing and almost gorgeous effect. The broken column is probably the effect of Turkish avarice, which has, at some time, committed this injury in a search for treasure, supposed to be buried beneath it. In the convent is an establishment of fifteen monks, who are mostly either Spaniards, or of Spanish extraction. The interior of the building is kept extremely clean and neat; the monks appearing industrious and orderly. The convent is, in some degree, supported from some houses in the village which it possesses; but by far the most important portion of its revenue is supplied by the brethren at Jerusalem. Near the convent I was conducted to a small church, which I was informed was built over Joseph's workshop. It has been repaired since Maundrell's visit to this place, when he describes it as having been in ruins. No miracle, wonderful to relate, has been attached to this spot. We next visited a small chapel which preserves the most celebrated relic in Nazareth. This is the table on which Christ fed with his disciples. It is a stone slab of about twelve feet by eight, standing in the centre of the chapel. On this you are told our Saviour dined, both before and after his resurrection. It appears to be composed of the common limestone, which is plentiful over the whole Terra Santa, and is fixed firmly in the ground, with which, however, the upper surface is by no means parallel. It bears some traces of having been formerly covered with iron. Round the walls of the chapel are suspended copies of a printed certificate in Latin, asserting its authenticity:—'*Tractio continua est, et nunquam interrupta, apud omnes nationes Orientales, hanc petram, dictam "Mensa Christi," illam ipsam esse, supra quam Dominus noster Jesus Christus cum suis comedit discipulis, ante et post suam resurrectionem a mortuis. Et*

*sancta Romana Ecclesia indulgentiam concesset septem annorum et totidem quadragenarum omnibus Christi fidelibus hunc sanctum locum visitantibus, recitando saltem ibi unum Pater et Ave dummodo sit in statu gratie.*' This is a great object of reverence, not only to the Christians, but even to the Arabs, who imagine that what is looked upon with such profound respect by the other sects, must have some miraculous qualities. The synagogue where Christ preached, and exasperated the Jews by his application of the words of Isaiah to himself, was next shewn. This is a small chapel, formerly in possession of the Greeks, but which has since passed to that of the Latin fraternity. The modern town is built on the side of a hill, as described by St. Luke; it is likewise surrounded by hills, which are in many points dangerously abrupt and precipitous. This was too good an opportunity to be lost on the monks, who have, accordingly, fixed upon a spot to represent the place where our Saviour was conducted by the incensed Jews.\* To this they frequently repair for the purpose of celebrating mass. It has evidently been selected from its great height and almost inaccessible situation; and is a point on which no part of the ancient city could by any possibility have stood. It is, besides, two miles from the present town. On a large stone, in an upright position, are some indentations, which, you are told, are the marks of Christ's hands and feet, made in his struggles to resist the violence."

The celebrated Acre was in a melancholy state when visited by Mr. Arundale.

"The buildings were nearly all in ruins, from the late siege which the city had undergone from Ibrahim Pasha. They strikingly exhibited proof, both of the valour of the attack, and the desperation of the defence. After riding for two hours, we entered the walls. The fortifications appeared almost impregnable, and, if defended by another Sir Sidney Smith, would probably resist any assault. I shall never forget the scene of noise, confusion, and devastation which presented itself on our entry into the town. The streets were crowded with the troops of Mahomet Ali, the pasha of Egypt, who poured along every avenue in complete disorder, and still violently contending with each other. After many intricate windings, and a good deal of pushing and piloting among the crowd of men and animals, we succeeded in reaching the Latin convent, which seemed to have suffered less than any building we had hitherto passed. A single monk was the sole inhabitant at the time; but he received us with all the hospitality in his power, and immediately accommodated us with apartments. Our next care was to proceed to the palace of the divan effendi, for whom we had a letter of recommendation. We were not, however, fortunate enough to see him; but his place was supplied by the bey, who represented him, and managed his affairs. We found him extremely polite and attentive. He offered us every kind of assistance, and also letters to the governors of any towns we might intend to visit. After acquainting him that we wished for mules to proceed on our journey the next day, and which, without the assistance of some official person, it would be almost impossible to procure, he very kindly promised to attend to our request; and sent a janissary to accompany us round the city, and to shew us the details of that scene of ruin. We ascended the ramparts. Among the most striking ruins were the principal mosque, and the palace of

\* Luke, iv. 28.

Abdallah Pasha, which, from their commanding height, afforded the most conspicuous mark for the shells. The beauty of the latter was perfectly annihilated; every thing had been wilfully destroyed, either by the madness of the victors, or the despair of the conquered. The beautiful fountains no longer fell sparkling from their marble basins, refreshing the splendid garden where art had rivalled nature in the effort to give pleasure to a man who, by the caprice of fortune, was now reduced to the condition of the most abject slave. They were now polluted by groups of dirty, noisy soldiers. The sites of the various buildings were indistinctly marked by confused heaps of broken columns and shattered friezes; but it was quite in vain to attempt to identify any of the magnificent buildings erected by the crusaders, in whose time it was a place of the greatest importance, both from its position and strength, sustaining several sieges. I remarked that the walls were much damaged in innumerable points by the cannonade, which appeared to have been carried on with the greatest fury; but I saw no attempts at reparation, excepting in the great breach on the eastern side. There was a great profusion of artillery, some of the pieces of most beautiful workmanship, principally of French and German manufacture. At sunset I returned to the convent, with my head full of battles and sieges, and in a state of mind rendered melancholy by those reflections which the sight of a theatre of war, deprived of all the illusion and excitement of actual conflict, must naturally excite."

## MISCELLANEOUS.

*My Book; or, the Anatomy of Conduct.* By J. H. Skelton. Pp. 208. London, 1837. Simpkin and Marshall.

THIS is a volume of multifarious maxims, &c. for the regulation of our conduct; most of them sensible, and, where they are wanted, likely to be useful. Others are quoted from sterling authors; and the whole *mélange* is unexceptionable in principle.

*Gleanings, Historical and Literary.* 8vo. pp. 400. London, 1837. Simpkin and Marshall.

THERE is much both of information and of amusement in these pages, though arranged without any very obvious purpose. The compiler has read a good deal, and set down all that appeared most striking, and thus made a very pleasant volume to lie on a table, and be taken up occasionally.

*Oriental Key to the Sacred Scriptures*, by M. de Corbet (London, Mortimer).—This is a very delightful little volume, illustrating the Scriptures by passages from various modern travellers in the East. It is curious to note how little manners and customs have changed, and how true as well as beautiful the imagery so profusely used by the inspired writers. We commend this *Oriental Key* to general use.

## ARTS AND SCIENCES.

## THE BRITISH ASSOCIATION.

## SEVENTH MEETING: LIVERPOOL.

[Third notice.]

WEDNESDAY.

## SECTION A.—List of Subjects.

1. Professor Lloyd's Description of a Magnetical Observatory at Dublin.
2. M. De la Rive—On the Interference of Electro-Magnetic Currents.
3. M. De la Rive—On an Optical Phenomenon observed at Mont Blanc.
4. Major Sabine's Report on Terrestrial Magnetism.
5. Mr. Fitzgerald—On Geometrical Theorems.
6. Mr. M'Gaughey—On an Electro-Magnetic Apparatus.
7. Mr. Holden—On the Atmosphere of the Moon.
8. Lieutenant Morrison's Instrument for Measuring the Electricity of the Atmosphere.

The business of the Section commenced by

Professor Lloyd reading a paper 'On the Subject of the Magnetic Observatory at Dublin.' He described the construction and various dimensions of the building. It had been found necessary to reject bricks, on account of the magnetic properties which they possessed, and therefore argillaceous limestone had been substituted in the erection. In order to avoid undue magnetic action, no iron had been used; but where metal was necessary, as in locks, bolts, hinges, &c., copper had been employed. The Professor next described the several astronomical and other instruments, their uses, positions, and the manner in which the various observations were made: he concluded by highly commending the liberality which Trinity College had displayed in the undertaking.

Professor Stanley said it was desirable not only to do away with the use of iron, but also of copper, or any other metal, in such buildings; and spoke of the possibility of substituting wood instead.

Monsieur De la Rive, of Geneva, and editor of the "Bibliothèque Universelle," then read, in French, a paper on electro-magnetic currents, which gave rise to a discussion in which several gentlemen took part. Monsieur De la Rive was also called upon to read a paper 'On an Optical Phenomenon observed on Mont Blanc,' which led to some conversation, in which Sir D. Brewster, Professor Lloyd, Mr. Lubbock, and Dr. Stevely, participated. The latter-mentioned gentleman observed, that whenever such an appearance is observed by the Belfast fishermen, they hasten to secure their boats, for fear of a storm. The Professor related an anecdote of a gentleman, who, having observed the phenomenon, pointed it out to a boatman, and asked him what it was. The man, however, instead of answering, ran off to spread the alarm, and shortly afterwards a violent storm came on, and almost destroyed all the vessels that had not been moored in a place of safety.

For Major Sabine's 'Report on Terrestrial Magnetism,' which succeeded, see our *Gazette* of the 16th inst.

Mr. M'Gaughey read a paper 'On Electro-Magnetic Apparatus.' He said, since the meeting of the Association in Dublin, public attention had been very much directed to the powers of electro-magnetism and electro-magnetic apparatus, and several persons had given their opinions that this power would soon be brought into extensive operation; he confessed, however, that he was not so sanguine. If the views of some could be carried into execution, they would occasion a complete revolution in mechanics, and set at rest at least one important question. But it was well known that electro-magnetic apparatus of great power became considerable in size, and troublesome in operation. He then exhibited a new electro-magnetic apparatus which he had constructed, and explained its construction and mode of operation at considerable length.

Mr. Holden, 'On the Atmosphere of the Moon,' noticed that it had been disputed (Schroeter excepted) from the days of Eugene (temp. William III.) to the work of Sir John Herschel in the "Cabinet Cyclopædia;" and the reason assigned for doubting the fact was, that there were no seas in the moon, as shown by the phenomenon of the crescent moon exhibiting, in the parts supposed to be water, inequalities instead of a perfect curve. Mr. H. maintained that the bottom and shallows reflected upwards would cause those indented appearances, and thus agree with the theory that there were seas in this planet. His other arguments were founded on observations. 1. That when our atmosphere

was equally clear, as tested by double stars, the marks upon the moon were not at all times equally clear, which proved an agitation in the atmosphere of the moon. 2. That when the moon was about two or three days old in the month of May, the whole dark orb appeared, as well as the fine bright crescent in the west; but the points of the horns of light projected beyond half the circle, and much further than a tangent from the sun would produce; he supposed to the extent of 15° of the circumference; and that nothing but an atmosphere could account for this. 3. That Herschel, Short, and others, had seen fire upon the moon; Herschel, for the space of two days, as stated by him in the "Royal Society Transactions." It was known that fire could not thus burn without air; but air was an atmosphere, and fire being seen on the moon proved that the moon had an atmosphere. 4. That viewing the occultation of a star (the star  $\mu$  2 of Cancer), when it should have gone behind the moon, it was visible, coming apparently within the periphery of the front of the moon, and remaining there for the space of two or three seconds. Others had observed the same, and published the details in the "Transactions of the Royal Astronomical Society of London." This would settle the question, even were the former three arguments wanting to complete the proof.

Professor Stevely suggested that the second and third reasons were not perfectly satisfactory.

Mr. Lubbock made several remarks on the circumstance of the projection of stars on the surface of the moon, and instanced the fact, that, on one occasion, in the Observatory at Paris, this projection was observed with one telescope, and not with another. Sir James South had also noticed it repeatedly in Aldebaran.

A very interesting conversation followed, in which Mr. Holden answered objections urged against his theory by Sir D. Brewster, and others.

Lieutenant Morrison concluded the business of the Section by a description of an instrument for measuring the electricity of the atmosphere, as follows—

"The action of electricity is shewn by its causing the needle to deflect from the north towards the east, when the air is positive; and to deflect to the west, when the air is negative; as regards the earth. In the former case, the earth appears to be receiving an additional supply of the fluid, and in the latter case to be losing a portion of the fluid, which very rarely remains in a state of equilibrium for any length of time. It is, however, very seldom excited to the extent mentioned in the record. When the needle was deflected towards the east, the electricity is recorded as 'plus,' and when it was deflected to the west, as 'minus.' The 'degrees' are those of a mariner's compass, the circle being divided into 360°; so that when the record is 'plus 45°,' the needle was pointing N.E., and when 'plus 20°,' the north pole of the magnet had deflected round towards the east, and had passed the south, and pointed S.S.W. My own opinion of the action of the electricity in the air is, that it modifies the temperature, and is the chief exciting cause of wind; and I believe that whenever any of the more remarkable phenomena of the atmosphere are observed, the presence of a great degree of the electric action will be detected by its affecting the needle in this instrument.

We subjoin the results of five days' observations at Cheltenham, of the atmospheric electricity:—

No. of observations	+ 75	Mean intensity	60.3
Ditto	— 22	Ditto	12.5
Ditto	nil 13	—	—
Total	110	Mean intensity	43.6

Dr. Brewster expressed his approbation of the instrument, and requested Lieutenant Morrison to make further observations and experiments, to be reported to the Association.

#### SECTION B.—List of Subjects.

1. Mr. Black—On Electricity and on Brewing. See last Gazette.
2. Dr. Apjohn—On a new Variety of Alum—on a Compound of Iodide of Potassium—Iodine and Cinnamile.
3. Professor S. F. W. Johnstone—Report on the Present State of our Knowledge of Dimorphous Bodies.
4. Professor Graham—On the Constitution of Salts, particularly those containing Ammonia.
5. Dr. Clarke—A Simplification of the Calculations relative to Gases.
6. Mr. Mallet—On the Natural Formation of Crystallised Copper in the Mine of Cronebawn, Wicklow.

Dr. Apjohn introduced to the meeting a new description of alum which had been found in alluvial passages, in strata of great thickness, averaging thirty feet in some places. It was a true alum, the alkaline portion being replaced by protoxide of manganese, and exhibited much the appearance of satin spar. Its relation to ordinary reagents was very similar to alum. It was not soluble in caustic potash; indeed, it corresponded to alum in every particular, but it was the first instance in which the alkali had been replaced by a metallic oxide. He had attempted to form it artificially, but had never succeeded, though he had very little doubt the thing might be accomplished.—Dr. Clarke. Are the crystals octahedral?—Dr. Apjohn. No, fibral.—Dr. Clarke said, that in all other alums the crystals were octahedral, therefore, the want of analogy was distinct. All the other instances of alum were similarly constituted, though in different forms. Mr. Faraday had a little of this mineral sent to him as alum. He thought it was not alum. He did not like to use the special term alum to a salt composed of sulphate of alumina and of manganese. The name alum was a useful name; if they used it generally, they would extend it out of the class to which it belonged. Dr. Apjohn said, that though the mineral wanted the octahedral form, he did not mean to say that the salt could not be brought to the octahedral state, although he was not able to do it. There was a slight portion of magnesia, but that, he thought, might be entirely accidental. Dr. Thomson asked, whether the mineral assumed any regular form when dissolved in water? Dr. Apjohn said he had not been able to observe any alteration. Mr. Campbell said there were two reasons why the mineral should not be called alum,—because it contained no alkali, and could not be used for the purpose of dyeing. Mr. Brett wished to know whether Dr. Apjohn had noted the quantity of water of crystallisation possessed by the mineral? Dr. Apjohn stated it to be between 25 and 26 atoms. According to chemists, the known descriptions of alum contained the same quantity.

Dr. Apjohn then proceeded to lay before the meeting another communication, relative to a new 'Compound of Iodide of Potassium—Iodine and Cinnamile,' which had been accidentally obtained at Dublin, in the course of the year. The solution in which it was found contained iodide of potassium and cinnamon water. When the prescription was made up, the mixture was very much clouded; but in a few days the solution was perfectly clear, and a crystalline sediment was at the bottom, of a beautiful bronze colour. This sediment was soluble in alcohol and ether; hot water decomposed it, precipitating the iodine. The action of heat upon it was particular. It was so volatile that

it could not fuse it unless when the temperature of the atmosphere is in 32°. It melts at 68° to 70°. If you urge the heat, the substance is decomposed, and the iodine evaporates, leaving a deposit behind it, which was iodide of potassium. The best mode of producing the compound was by taking ten grains of iodine, half an ounce of iodide of potassium, and a quart of cinnamon water. Dissolve the iodide of potassium in a minimum of water, and pour the solution into the cinnamon water, which then becomes turbid. A sort of brown powder shortly is deposited at the bottom, and the chloridine of the mother liquor disappears, which latter is found to be entirely divested of every trace of the oil of cinnamon. When the compound is brought into contact with the quicksilver, it is completely deprived of the iodine, which goes over to the mercury. This is important, because cinnamine is probably left free—probably forms cinnamic acid, in combination with the potassium. These experiments had, however, not been brought to a close. He had attempted to burn it, but had not succeeded. He had, however, arrived at some results with regard to its composition, the substance being, according to his belief, composed of latom of iodide of potassium to 3.95 of iodine, or nearly 4. The number of atoms of cinnamine were 5.6. There was no doubt that cinnamine could be extracted in this manner, and it was the first combination of a negative element with a metallic base. Dr. Kane threw considerable doubts upon the results of the compound, and thought that before it was positively asserted that a negative element would combine with a metallic base, a little more confirmation would be required.

Professor Graham then read a paper 'On the Construction of Salts, particularly those containing Ammonia.' He contended that water formed the base of most of the salts, designating the salts as oxalates of water, &c., and was satisfied that where ammonia and water replaced each other, it was in atomic proportions. It was supposed that an atom of water might be replaced by half an atom of ammonia and half an atom of metal, but this was not the case: ammonia was merely a basic adjunct.

Considerable discussion arose on this paper, in which Mr. Richard Phillips, Mr. Golding Bird, Dr. Kane, Mr. Faraday, and Professor Johnstone, joined; the three first appearing to think that the Professor had unnecessarily altered the chemical nomenclature, and that the salts had other than water bases. Professors Faraday and Johnstone inclined to Professor Graham's views on the subject.

Dr. Clarke, of Aberdeen, read a paper 'On the Simplification of the Calculations relative to Gases,' in order that teachers might the better be able to explain the constitution of mixed gases, and pupils to understand them. Taking the atomic relations of gases as generally used in this district, viz. oxygen 8, hydrogen 1, and the bulk of 8 troy grains of oxygen being 23.4.10 cubic inches, hydrogen will occupy 46.8.10 cubic inches, being double that of oxygen. If we take azote on this atomic scale, it will be 14, and carbonic acid 22; the bulk of 14 grains of azote is 46.8.10 inches; 22 grains of carbonic acid will likewise occupy 46.8.10 inches. He described the use of the term volume, as it was so vague a term that a pupil could not comprehend it easily. A very great facility arose from the employment of simple quantities. Take, for instance, the metal zinc; it is quite obvious that one atom of zinc, when immersed in sulphuric acid, will give off one atom of hydrogen; and if we want to know how much

hydrogen will be given off by any thing, the mode is this: as 32 (the atomic weight of the zinc) is to 14, so is 46.8.10 to the required quantity. It is quite obvious that thus we get at the bulk at once, applying, of course, the usual corrections for the state of the thermometer and barometer.

Mr. Mallet laid before the meeting some specimens of crystallised copper found in the mine of Cronebawn, in the county of Wicklow, upon which subject he read a paper. Besides finding lodes of copper, the water at the bottom of the mine deposited crystals upon timber, which were found to be metallic copper. The question was, how the metallic crystals were formed in the water? The galvanometer was considerably deflected in the mine.

A letter was read from Professor Hare, of Philadelphia, in which he stated that he had succeeded in melting platinum in masses by means of his oxyhydrogen blowpipe.

#### SECTION C.—List of Subjects.

1. Mr. J. Henwood—On the "Heaves" of some Metalliferous Veins in Cornwall.
2. Rev. D. Williams—On Plants in Greywacke, in Devon.
3. Mr. W. L. Crook—Unity of Coal Formation in England and Wales.
4. John Ham—On the Quantity of Mud in the Tidal Waters of Severn, Usk, and Avon.
5. Mr. J. Rivers—Temperature of Subterranean Rivers.
6. Professor Sedgwick—IncurSION of the Sea into the Collieries at Workington.

Mr. Henwood read a paper 'On the Heaves of some Metalliferous Veins in Cornwall,' in which it was shewn, that at Dolcoath mine a cross-course dislocates two lodes, heaving them both to the right, and one part of one of them from the slate into an *elvan-course*, whilst the *elvan* is simply intersected, but is not at all dislocated. At but a very short distance the same cross-course is heaved by a lode. In Huel Prudence mine, an *elvan-course* and a lode, both dipping north, and a second lode dipping south, are all heaved right by the same cross-course; whilst the vein dipping north traverses and dislocates (throwing the lower part upward) of the lode underlying south. He imagined that a subsidence of the *elvan* and the two lodes on one side of the cross-course in Dolcoath, would explain their present positions approximately; but the *heave* of the cross-course by the other lode, remained unexplained on the theory. According to the hypothesis, also, one of the lodes in Huel Prudence should be heaved right and the other left; but both are, in fact, heaved the same way, and there is still unsatisfied, the throw of one vein by the other. These facts Mr. Henwood thought inconsistent with the theory of mechanical disturbance, and he was disposed to imagine them contemporaneous with the veins themselves. Some cases, however, he thought might possibly be mechanical; but whatever the origin of the phenomena, their solution was of vital consequence to the miner, as the accurately understanding their laws would prevent useless and unprofitable outlay, which, at present, is too frequently incurred from not knowing where to find the severed portions of a dislocated vein. He concluded by stating that Cornwall offered an extensive field for the verification of any theory of veins, and that the *practical miners* of that county entertained the opinions which he had advanced. Upon this an interesting discussion ensued.

Mr. Hopkins said that there could be but few worse places for observing the phenomena of the intersections of veins than in Cornwall, for the angles at which they met, and which, for theoretical purposes, must be most accurately determined, could seldom or never be accomplished in that district. The positions

directions of the veins in Cornwall, he thought accurately coincided with the of the mechanical theory, which that veins must have been originally (not however open ones), and in these instances of the lodes were deposited. The contemporaneous theory, if it deserved the name, was an inconceivable process, for it would not account for the occurrence of the substances now found in lodes, which the hypothesis of fissures permitted the accumulation of by infiltration, and by divers other means. The mineral matter of veins continually occurred in determinate planes, and in no irregular masses. He thought the mechanical theory would readily solve every case of dislocation in Cornwall.

Mr. De la Beche said, that excepting in "a few unhappy cases," which his friend Mr. Henwood had selected, the mechanical theory was strictly applicable. Wherever dissimilar rocks occurred near the veins, motion could most indubitably be proved to have taken place; many, indeed most, of the veins of Cornwall, were "faults;" for example, in Dolcoath, Harriette's lode was incontestably a "fault." Indeed, incontrovertible geological evidence, for instance, the occurrence of organic remains in some of the slates, shewed the physical impossibility that the veins could have been contemporaneous. He would go so far as to say, *he could solve every case of a heave found in Cornwall, even to the small strings of tin ore and schist in Carolaxe mine, of every one of which he could prove the mechanical origin.*

Professor Phillips said that Mr. Henwood had before submitted these curious intersections to him, and he had calculated their displacements according to the mechanical theory, and he thought that he could explain them all, excepting the case at Dolcoath, where the lode heaved the cross-course; and here, perhaps, this lode was of more recent origin than the others, and the throw of one vein by the other at Huel Prudence: this last, indeed, he did not think the theory could explain. The contemporaneous theory literally taken, he did not think could stand; but still there were cases which the other theory could not explain; and surely no one would say that it was perfect, whilst it left one single condition unsatisfied. The jointed structure of rocks, and the approximation to conformity between the directions of the veins and joints, had unquestionably a great influence on the question under consideration. So far, however, he had no doubt that he and Mr. Henwood agreed, that wherever the jointed structure originated, he thought the consolidation of the rocks in that form, and of the veins in them, was simultaneous, and the difference between them, he thought, more in word than in reality. The case submitted was one of the greatest importance. Practical men applied to scientific men for assistance in the due direction of their labours, and surely their request should have immediate and most considerate attention.

Mr. John Taylor, junior, described many interesting features of metalliferous formations in Flintshire, in Clare, and in Carolina. In Coniston mine, he said, the mere joints in the rock shifted the vein, and Mr. Hopkins, he supposed, would call these cases of unquestionable mechanical disturbance. If the eminent men who had spoken so certainly of being able to point inevitably to the dislocated portions of lodes, they would confer a favour of no ordinary value on the miner, whose time and money were too often wasted in "driving" in a wrong direction in pursuit of a "heaved" vein.

Professor Sedgwick said, Mr. Henwood has here laid before the Section but a very few of the numerous important results he had obtained during the years and years in which he had been digging, delving, climbing up, down, to and fro, sometimes in mud on hands and knees, and, in the most tedious manner imaginable, had travelled fathoms by hundreds and thousands; miles, ay, *not less than two thousand miles underground.* Such results, obtained with such labour and trouble, could not be too highly valued. He could neither agree with Mr. Henwood, in considering all veins contemporaneous, nor could he go with his friends, Mr. Hopkins and Mr. De la Beche, making every thing mechanical. He was nearer to Professor Phillips, and indeed thought that they and Mr. Henwood were more nearly agreed in fact than appeared in word. He thought contemporaneous consolidation, or solidification, would suit both parties, and then he thought there was little difference left to be explained. Many of the veins had incontestably been formed, or got together, whilst both they and the rocks were unconsolidated: these solidified together, and thus gave a contemporaneity to their present form, although it by no means followed that they had all in a moment assumed this condition. Ages and ages might pass, and doubtless had passed, in the interval. He thought their best thanks should be given to the author of the communication.

Mr. Henwood rose to reply; but the President (Professor Sedgwick) stopped him, and called for the next paper.

Dr. W. H. Crook 'On the Unity of the Coal Deposits of England and Wales.' The object of this communication was to shew that the coal-fields of England and Wales were not distinct basins, but that the supposed basins were merely portions, which had been detached and elevated by the agency of siltic and trap rocks of a much larger deposit, spread over the districts now covered by rocks of the new red sandstone series. Dr. C. conceived that this view may be extended to the coal of Belgium, of the North of France, and the North-West of Germany; the carboniferous beds of those countries, as well in our own, having originated, in his opinion, in a drift of vegetable substances from countries lying to the East and E.S.E. of them; and he also stated, that the richness and extent of the English coal-fields, especially those of the midland counties, arose, in a considerable degree, from the impediments offered to the transit of the drifted matter by the slate and other ancient formations of Wales and Cumberland. The President, in presenting the thanks of the Section for the communication, stated, that there was much probability in these views in respect to England; but he was very doubtful whether they would apply to the coal-basins of Wales.

Mr. Sedgwick now addressed the meeting, and drew a vivid picture of the irruption of the sea into the colliery at Workington. His account of the escape of a miner of the name of Brenner, who scaled 3000 yards, and burnt out three candles in effecting this miraculous retreat, had so potent an effect on his audience, that a voluntary contribution was raised for him, and a subscription of 34l. 4s. collected on the spot.

Mr. Ham next read an able paper 'On the Quantity of Mud in the Tidal Waters of the Severn,' &c.

Before vacating the chair, Professor Sedgwick thanked the ladies and gentlemen present for their kind donations in support of his Irish friend, the miner.

## SECTION D.—List of Subjects.

1. Dr. D. Williams—Notice of a Species of *Liman* voided by a Patient.
2. Mr. Bellingham—On the frequent occurrence of *Puitchcephalus dispar* in the Human Intestines.
3. Dr. Daubeny's Report on the Cultivation of Plants under Glass, and without Ventilation.
4. Mr. R. B. Ward's Report on the same.
5. Mr. Pooley—Case of a Bird remaining torpid under water.
6. Mr. Gould—Exhibition of Drawings of new Birds from Australia.
7. Mr. E. Forbes—On some rare forms of British Birds and Animals.
8. Mr. J. Smith—On some undescribed Shells.

The first two papers need only be alluded to; Dr. Daubeny's and Mr. Ward's reports on the cultivation of plants, we have sufficiently anticipated; as we have also Mr. Pooley's story of the swallow incrustated in ice. Mr. Gould's drawings were, like all his other productions, superb, and the novelty of some of the subjects added greatly to the interest of the exhibition. The other papers were short, and without the specimens, *ir-reportable*.

## SECTION E.—List of Subjects.

1. Dr. J. Macintosh—Demonstrations and Exhibitions of Morbid Preparations of Dysmenorrhoea.
2. Sir James Murray—Upon Urinary Salts.
3. Dr. J. G. Simpson—Cases illustrative of the occasional Propagation of Malignant Cholera, &c.
4. Dr. W. H. Madden—Experiments on the Connection between Nerves and Muscles—communicated by Professor Alison.
5. Dr. G. C. Holland—Inquiry into the Influence of the Pain of the Heart, and other Organs, in health and disease.
6. Dr. Hugh Carlisle—On a Malformation of the Cerebellum of an Infant.

The first of these was a very important medical exposition, and will, we trust, be given to the public in a proper channel. The other communications were also of a valuable character, though the details are not quite calculated for popular reading. In the conclusion

A paper was read by the Secretary from Dr. Hancock, of London, 'On Leprosy.' Dr. Macintosh said it was hardly a paper for the British Association. It was too lengthened, too controversial, and too prosy. The Association wanted experiments and facts, and not a history of cures, and a controversial discussion. This was more a paper for a magazine. They wanted information as to improvements in medicine. The President said these observations applied more to the committee who had admitted the paper. But, as the author was absent, it would be better if Dr. Macintosh confined himself to a medical view of the subject. Papers should be as much as possible on the fundamental principles of medicine, and relate to controversial facts, or detail cures. They should carefully exclude any thing which would tend to make their Section a puffing Section. Dr. Macintosh said something really ought to be done in order to keep up their character as a part of the Association. The descriptions of disease in the paper were very good.

[We take this opportunity to remark on the very great importance of the matter here alluded to. The sectional committees are either ill-constituted, or they often leave their duties to be performed at random. Many papers were brought forward in every department of science, so *puerile* and *aged*, that they ought never to have been seen by the Association. This also led to some disagreeable scenes, in which individuals, presenting themselves under the sanction of committees, were abruptly checked and put down by the presidents, as unworthy to be heard, in the face of the assembled sections. Surely, a more careful previous examination of the papers offered is possible; and as surely the members of the committees must be competent to decide whether they are worthy of publicity, or such trash as too frequently finds its way into these pro-

ceedings, occupying time that might be much better employed, and throwing a slur over the general transactions.]

SECTION F.—Lord SANDON in the Chair.

Mr. Gregg read a report on the condition of the working classes in Manchester, Salford, Bury, Duckinfield, Staly-bridge, and Ashton. The result of the inquiry was, that a population of 322,800 persons of the working classes had been visited, from house to house, during a period of seventeen months, in the years 1835-6, at an expense of 175*l*. The estimated population of the different places at the time of the inquiry was—Manchester, 200,000; Salford, 55,000; Bury, 20,000; Ashton, 22,000; Staly-bridge, 17,200; and Duckinfield, 8600. The number of houses and dwellings examined were—in Manchester, 28,186; Salford, 9538; Bury, 2755; Duckinfield, 1690; Staly-bridge, 3313; Ashton, 3835. Of these there were:—

	Man- chester.	Salford.	Duckin- field.	Staly- bridge.	Ashton.	Bury.
Houses .....	21,453	7584	1434	2547	3149	3641
Single Rooms .....	3,162	1108	224	670	637	46
Cellars .....	3,571	846	32	56	59	68
Licence Victu. ....	..	..	7	29	69	117
Beer-houses ..	..	..	25	50	89	..

The houses were also classified, as well-furnished (chairs, tables, a clock, chest of drawers, &c.); not well-furnished; comfortable, and uncomfortable. Tables of the average rents, of the number of persons in each family, their occupations, creeds, country, &c., were given; but these were so exceedingly voluminous, and extended to such minute particulars, that we cannot pretend to give even an abstract. The following extracts will perhaps suffice:—

	Man.	Salf.	Bury.	Duc.	St.B.	Asht.
No. of persons inhabiting houses .....	94,250	31,693	..	6886	19,345	14,604
Ditto rooms .....	9,351	3,132	..	224	670	637
Ditto boarding .....	9,671	3,551	..	..	..	..
Ditto cellars .....	14,794	3,310	..	32	56	59

No religious profession:—  
Heads of Families 1,834 1,350 79 680 1174 1295  
Lodgers ..... 967 | 330 | 41 | 269 | 588 | 584 |

Average number of each family was rather more than  $4\frac{1}{2}$  in the four latter boroughs, and in many there were three, four, five, and, in some instances, six persons to each bed. The houses examined were all under 25*l*. a-year. From these tables it appeared that the number of persons living in cellars in Manchester was  $11\frac{1}{2}$  per cent of the whole population; in Salford, 8 per cent. At the suggestion of Mr. Gregg,

Mr. Langton, of Manchester, read a statement respecting Liverpool; from which it appeared, that in the parish, or old borough, there were 6506 cellars, 1964 courts, and 25,732 dwelling-houses, for a population of 190,000: in the outskirts, 6364 houses, 987 cellars, and 307 courts; population, 40,000. Few of the courts possess any outlets, and of the cellars, the greater proportion are dark, damp, and without ventilation. The average was four persons to each cellar, giving a total of 30,000 occupants of cellars out of a population of 230,000; and it was estimated that two-thirds of the population belonged to the working classes.

Mr. Gregg stated, that in Manchester 64 per cent belonged to the working population; in Salford, 74 per cent; in Bury, 71 per cent; in Duckinfield, 94 per cent; in Staly-bridge, 90 per cent; and in Ashton, 81 per cent. He concluded by expressing a hope that this sort of inquiry should be extended throughout the country, as nothing for the permanent improvement of the condition of the poor could be done without it.

Mr. Wyse expressed a similar hope, and concluded by moving a vote of thanks to Mr. Gregg, which was seconded by Mr. Falkner, and carried unanimously.

A very long and animated discussion ensued. The first point on which a question was raised, was the number of persons set down as making no religious profession, Mr. Adam Hodgson and Mr. Rathbone both doubting its accuracy. From the explanations given, it appeared that most of the persons so classified had not described themselves as having no religion, but had declined giving any answers to the agents on that point.

Dr. Carpenter ascribed the superior condition of the working classes in Birmingham to the fact that they had proper dwelling-houses—no inhabited cellars, and no courts of the description mentioned as existing in Liverpool.

Colonel Sykes thought it exceedingly desirable that tables of the comparative mortality in cellars should be prepared. In Birmingham, the rate of mortality was one in fifty-five; in Liverpool, it was considerably more: and this might arise from there being inhabited cellars in the one place and none in the other.

Mr. H. Ashworth stated, that the condition of the working population in the neighbourhood of Bolton had been considerably improved, in consequence of houses of a better sort having been erected for their accommodation. So great was the desire to obtain houses of this sort, that, whenever one fell vacant, there were twenty applications for it.

Mr. Wood mentioned a plan adopted by a factory owner of his, in the neighbourhood of Bolton, with the best effects. It was this:—The gentleman built houses for his workmen, who agreed that a certain sum should be stopped out of their earnings; and thus, ultimately, the houses became their own property.

Mr. Ashton, of Hyde, stated that he had built three hundred houses for his workpeople, calculated for their proper accommodation, on something like the same plan. The result was, that the people formed local attachments, and, during a period of thirty-seven years, they had only one turn-out of a week's duration. The cost of the deed of conveyance, which was ordinarily 50*l*. on a house not worth more than that sum, was mentioned as an objection to this plan; and the hardship was represented as the greater, inasmuch as property of another description might be transferred, to the value of 1000*l*., by simple endorsement, without any cost whatever. Several gentlemen, amongst whom was Mr. Slaney, strongly urged the necessity of legislative interference.

Mr. Shuttleworth stated, that the agent for the Duke of Norfolk's property at Glossop-dale had informed him, that the houses were almost entirely occupied by operatives, who were the owners of their own dwellings. The agent had also stated, that the facilities in this respect had not only greatly improved the moral and intellectual character of the community, but also been the most efficient means to increase the value of the property that could be adopted.

Mr. Ashworth mentioned a singular fact, in corroboration of these views. Several years

ago, a fire broke out in a mill belonging to Mr. Kirkman Finlay, in Ayrshire. It was put out by the zealous exertions of the people employed at the mill, who had comfortable dwellings in the immediate neighbourhood. Trusting to this local attachment, Mr. Finlay had since discontinued the insurance of his mill.

Mr. Simpson thought the habitation of cellars a proper subject for legislative interference, as a matter of medical police. These cellars were generally the very hot-beds of infection and disease. He had been informed that the cellars were generally very damp, and that in one instance, where a man was lying ill of typhus fever, the water had to be baled out of the cellar before the doctor could enter.

Mr. John Finch stated that he had visited cellars in Liverpool which contained from twelve to seventeen inhabitants each. He stated that, at the last Kirkdale sessions, out of fifty-nine persons for trial, only two could read; and he contended, that ignorance was the great cause of crime, and drunkenness of ignorance.

Mr. Slaney, M.P. stated, that in some districts building clubs were established, the members contributing funds to raise houses, and, when erected, casting lots for the possession and occupation.

Mr. Birmingham, agent for the estates of Lord Clonbrock, in the county Galway, stated that houses comparatively comfortable had been provided for most of the tenants, at an expense of 5*l*. each to the landlord, and 10*l*. to the tenant. The mere furnishing of windows alone, by letting in light and air, promoted health and comfort, and produced habits of cleanliness, as the sight of the dirt generally produced a wish to remove it.

Mr. Wyse thought that a taste for proper dwellings would soon be introduced amongst the working classes, and that a course of industrial education, such as that pursued at Mr. Fellenberg's school, in Switzerland, would greatly promote the object in view.

Mr. John Smith thought that nothing could be of greater importance than to give the poor man a motive to be the holder of his own dwelling—a motive to be a little house-proud. This would greatly advance the cause of temperance, and improve both the moral and physical condition of the lower classes. He begged to call the attention of the Section to the neglect of humble domestic architecture, and recommended that means should be taken to devise a plan for obtaining the greatest possible amount of comfort and accommodation for a given sum. He had known the most lamentable effects to result from the want of proper divisions in houses; and also instances in which houses, containing all necessary accommodations had been built for the same sum as others which contained no proper accommodations whatever.

Mr. Slaney then read a long and valuable paper on the condition of the poor in large towns, founded on parliamentary returns and other official documents. From the amount of taxes on various articles in use by the rich and middling classes, which he enumerated, he concluded, that, within the last fifty years, a very great improvement had taken place in the condition of these classes, and also that considerable improvements had been effected in the condition of the agricultural population, in the twenty-six counties in which allowances had been made out of the poor-rates. He had returns from twelve of these counties, shewing that a reduction of 41 per cent had been effected in the rates, whilst, at the same time, the

condition of the peasantry had been most materially improved. He divided the working population of large towns into two classes, the skilled and unskilled artificer. The latter part of the population had increased in a most surprising manner as compared with the rest. Within a period of ten years, according to the returns of 1831, the increase in the whole kingdom was 16 per cent; in London, 20 per cent; and in Manchester, 47 per cent; in Glasgow, 38 per cent; Birmingham, 33 per cent; Leeds, 47 per cent; Liverpool, 44 per cent; being nearly 42 per cent on the five principal towns, or three times the increase in the whole kingdom, and four times that of many of the agricultural districts. He then read various returns as to the number of persons charged with offences, and committed in England and Wales, at various periods; shewing that, whilst the population had only increased 18 or 19 per cent in twelve years, crime had increased in the proportion of 90 per cent, or five times the rate of increase in the population. In 1835, the number of persons charged with offences was, in England and Wales, one in 619; in Bristol, one in 290; in Middlesex, one in 336; in Lancashire, one in 481; in Cheshire, one in 492; in Anglesey, one in 8000. The quantity of ardent spirits consumed in the United Kingdom, in the year 1817, was 9,200,000 gallons; in 1827, 18,200,000; in 1836, 26,745,000 gallons. In other words, whilst the population had only increased 33 per cent in twenty years, the consumption of ardent spirits had been trebled within the same period. Ardent spirits were consumed principally, if not entirely, by the inhabitants of the densely populated towns. The increase was, therefore, of a most alarming nature. Taking the whole kingdom, the proportion of spirits consumed was, in 1820, one gallon to each inhabitant annually; in 1833, one gallon and a half. This was referable to the whole kingdom; but, when it was considered that the drinking population was condensed in the large towns, the increase was, indeed, alarming. From all these facts, Mr. Slaney inferred the absolute necessity of doing something towards the amelioration of the condition of the working classes, and improving their character.

Mr. Felkins, of Nottingham, also read a long and valuable paper respecting the condition of persons employed in the lace and hosiery trades in that town; of whom 4407 were thrown out of employment during the late commercial crisis. One most important fact detailed in the report was, that, out of 1043 persons who had never received parochial relief, and whose circumstances had been particularly inquired into, only one in four belonged to any benefit society. The inference drawn by Mr. Felkins was, that no increase in the rate of wages would permanently benefit the working classes, unless the proper appropriation as well as the rate of wages were attended to.

Several gentlemen spoke highly of the value of this paper, and suggested that it ought to be published for general circulation amongst the working classes. It was observed, that this might readily be accomplished by subscription; and, before the meeting broke up, it was announced that one thousand copies had been subscribed for.

Mr. Langton stated, that in Manchester large sums had been drawn out of the Savings' Banks during the late pressure,—a convincing proof that those institutions had answered; whilst a great majority of the Friendly Societies did not come within the rules prescribed by act of parliament, and were, in fact, mere

impositions on the working classes; many of them, by their regulations, expressly contemplating bankruptcy.

#### SECTION G.—List of Subjects.

1. Mr. West—Ventilation of Tunnels.
2. Mr. Musket—On Iron for Railways.
3. Mr. Willis—On the Teeth of Wheels.
4. Mr. Currie—On Safety Railways.
5. Dr. Lardner—On Steam Navigation.

Mr. Russell commenced the proceedings with further observations 'On Tide-Waves, &c. in rivers.' Having once determined that the tidal wave was propagated according to the laws which regulate the propagation of other waves, it was in our power to modify the propagation of the tidal wave in rivers, so as to make it conduce to the better navigation of those rivers. The tide might be made to reach an inland port earlier; it might be made to extend to a much greater length towards the source of a river; it might be brought in in a larger volume, and retained for a longer period in the channel. These were effects of the highest commercial value, and of great importance to the welfare of the community, and he should now describe the means by which they were to be accomplished.

Mr. West read the paper 'On the Ventilation of Tunnels.' Mr. West had, it appears, made a series of experiments within the tunnel at the terminus of the Leeds and Selby Railway. The result of these experiments is an opinion, that when a number of shafts are carried down into a tunnel, the current of air escapes up the first of them; and that, even on days when there is no perceptible motion in the atmosphere, there is decidedly a current of air through tunnels, quite from the end into which this slight draught is directed.

Mr. Marshall gave the result of his experiments on railway iron. He described the several methods of refining and puddling iron now in use. His experiments had been directed to the ascertainment of the best method of preparing iron so as to resist the vibratory action on railroads, which causes the iron to exfoliate and lathinate. He gave it as his opinion, that crystallised iron was improper; and that the iron used in railways should contain as great a quantity of fibre as possible. With this view he recommended the use of iron manufactured immediately from the pig-iron by rolling. Various specimens were produced, which were to be laid in the model-room for examination.

Mr. Willis communicated 'A New Mode of adapting the Teeth of Wheels, so as to cause Wheels of various Diameters to work truly.'

Mr. Currie made some remarks on a safety railway. His plan seemed to be to carry the rails over unequal surfaces on wooden platforms, instead of by embankments; but Dr. Robinson, the chairman, would not permit him to finish his explanations.

Dr. Lardner resumed his discourse 'On Steam Navigation to India and to the United States,' as noticed in our report of yesterday.

The ordinary was again excellently provided, Lord Sandon in the chair, who did its duty in a most agreeable style. Several entertaining addresses introduced the toasts; and M. de la Rive delivered a very eloquent tribute of thanks and compliments in return for the health of the distinguished foreigners present.

Mr. Snow Harris, at the Amphitheatre, delivered a most appropriate and striking lecture on the effects of lightning on shipping. It was greatly applauded.

#### MONDAY.—SECTION A.

Sir David Brewster gave an 'Account of a new Property of Light.' In this extempore

communication, the author shewed that, when light, separated into its elements by refraction, was made to interfere and produce fringes by the retardation of a part of the pencil, the interference took place only when the least refrangible side of the retarded ray was next the most refrangible side of the direct ray. When the most refrangible side of the retarded ray was next the least refrangible side of the direct ray no interference took place. Various other phenomena, connected with this remarkable phenomenon, were described by the author; all of which tended to shew that they could only have their origin in a new property of light decomposed by refraction.

Mr. Whewell made some observations upon this communication, as if he conceived that the leading phenomenon could be explained by the doctrine of interference; but, in consequence of Sir David Brewster pointing out his misconception of the experiment, he withdrew his observations. Professor Steeley and Professor Lloyd regarded the new facts as inexplicable by the undulatory theory.

Sir David Brewster's paper 'On the Cause of the Structure developed in the Crystalline Lens by the Absorption of Distilled Water.' At the meeting of the Association at Bristol, the author had communicated an account of certain remarkable changes in the doubly refracting structure of the crystalline lens, which take place when it is immersed in distilled water. The lens expands by the absorption of the water, and the various structures of the lens are not only modified, but a new negative structure springs up in the dark neutral line between two positive structures. It seemed very strange that the mere absorption of water should create a new structure in a dead crystalline lens; but the author found that all the phenomena were owing to the production of a negative doubly refracting structure in each side of the capsule of the lens, in consequence of its being expanded by the absorbed water. This negative structure, of course, appeared in the dark neutral line unmodified, while it diminished the positive doubly refracting structure of the lens. The author proved, by direct experiment, that the extension of each face of the capsule was capable of producing a negative tint, equal in value to that developed in the experiments; and he shewed, how to produce the whole of the phenomena by combining the negative tints of a piece of circular glass with the crystalline lens. The author also pointed out to the Section, how these experiments led to a rational mode of curing cataract or opacity of the lens, whether it is the soft or the hard one.

Captain Denham exhibited to the Section an improvement in lighthouses. It consisted in using a coloured glass chimney for the Argand burner, in place of a large sheet of coloured glass placed on the mouth of the reflector. This contrivance seems to have been submitted to Mr. Faraday (as scientific adviser to the Trinity Board), who had pronounced an unfavourable opinion of it. Captain Denham's object in submitting it to the Section, seems to have been to obtain a more favourable judgment. Mr. Faraday stated very briefly to the meeting the objection which he had to the contrivance.

Sir David Brewster expressed his entire concurrence in the opinion of Mr. Faraday, and stated several additional objections to Captain Denham's contrivance. He remarked that, if the chimney of coloured glass should break, an accident to which it was peculiarly liable, from being close to the burner, the distinctive character of the light would be lost, and life and

property exposed to danger. In the experiment exhibited to the meeting, the red coloured glass chimney obviously gave a brighter light than when the mouth of the reflector was covered with a plate of red coloured glass, but Sir David Brewster shewed that the experiment was fallacious unless the chimney and the large plate were made of the very same glass, for if this was not done it was easy for the experimenter to throw the balance in favour of either one or other contrivance. When the large plate is used, the light is transmitted through it almost perpendicularly; whereas in the case of the red glass chimney, the light falls upon its inner surface at great obliquities, so that a great deal of it is thrown up the chimney by reflection, or utterly lost. Sir David Brewster called the attention of the Section to the fact that different red glasses absorbed different parts of the spectrum, some absorbing the orange, and others certain portions of the red space, and shewed that it requires a thorough knowledge of the absorptive action of different media upon light, to be able to select the proper coloured glass as the most suitable media for giving a distinctive character to our lighthouses. A person who did not possess this knowledge might use coloured glass which absorbed the most luminous and effective rays, and render it necessary to use twice or even thrice the number of red lights in order to give them the same range as the white ones. He states, also, that the atmosphere absorbs certain parts of the spectrum, and rendered white light red; and maintained that the best red glass for distinguishing lights, is that which derives its redness from absorbing the same rays as the atmosphere does, because its light being that which the atmosphere absorbs the least, will pass through it with the least loss. On the other hand, if we could put a glass which transmits only those rays which the atmosphere absorbs, all its red light would be obstructed by passing through the atmosphere.

## SECTION C.

Captain H. M. Denham, R.N., Resident Marine Surveyor at the port of Liverpool, read a report, illustrated by plans, diagrams, and sections, and elucidated by verbal argument, 'On the Vertical and Horizontal Capacity of the Mersey'; shewing the quantity of insoluble matter in suspension during each flood and ebb, with the predominant portion on the ebb, and consequent deposit in the bay of Liverpool; and shewing the curious coincidence of matter detected in transit, and measured at its lodgment. The trigonometrical plan embraced the two great estuaries, Mersey and Dee, with all the sands and channels in Liverpool, ranging over 105 square miles; i.e. as far out as where the cross set of the Irish Channel limits the deposit or under-shelf of the banks. The diagram and section shewed the relative levels of high and low-water springs and heaps, the constant level applicable to both tides, the half-tide level, and the inclined plane of high-water surface between the head of the tidal water and at the embouchure. The several differences of high-water times every five miles from seaward, its hourly velocity, its whole transit and differences in vertical range, were minutely marked and explained; whilst the plan as minutely delineated the areas of each contracting or expanding section of the estuary. Thus, the Mersey, between its orifice at the Rock Lighthouse and Warrington Bridge, presents an area of 113,171,200 square yards, containing, at the full and change of the moon, 779,174,880, and, at her quarter-

ing, 292,653,200; or the average quantum of 535,914,040 cubic yards of tidal water, which circulates to and fro four times every 24 hours, the flood occupying 5<sup>h</sup> 20<sup>m</sup> in rushing through the straits (or neck of the bottle which the entrance straits is to the expansive space within), at a maximum rate of 6 $\frac{1}{2}$  miles per hour, equal to 23 $\frac{1}{2}$  transitu; the ebb occupying 6<sup>h</sup> 30<sup>m</sup> in disgorging itself, and the freshes, at a maximum rate of 7 miles per hour, equal to 29 $\frac{1}{2}$  transitu; the greatest impetus of flood attained at 3 hours' flow; that of the ebb at 2 hours' egress. The various courses of these tides were distinctly delineated, exhibiting at one view the points of deflexion, consequent eddies and deposit, and the channels created by incidence and reflection of its set. Had Captain Denham's communication been confined to the results of such close and elaborate observations on so formidable a column of tidal action as 32 feet affords, it would have been a valuable treat to the Association; but he proceeded to shew how possible it is to detect the amount of silt, &c. held in solution during each tidal journey. He presented for inspection his simple and effective "valve-bucket," which enables him to bring up a sample of the rushing water at any given depth from the surface, without its mixing with any of the intermediate water. And by extensive series of such at every half-hour, flood and ebb, and at depths from 6 to 30 feet below the surface, each series being carefully analysed, so as to produce not only the quantity but the quality, or component part of sediment, amounting to 29 cubic inches on the flood, and 33 inches on the ebb, in every cubic yard of tidal water,—equal to 330,989 cubic yards on each flood, and 379,054 upon each ebb, evincing a preponderance of matter, and left in the bay, upon each ebb, equal to 48,065. A diurnal deposit, that, in tidal rotation of 730 refluxes, amounts to the vast bulk of 35,087,450 cubic yards, which, if equally disseminated over the first ebb-range (64 square miles), would produce an annual layer of 21 inches thick. It, however, is not wholly detained over the first region; for the succeeding ebb sweeps one-third off before it adheres over the secondary range of 41 square miles, in the water of which a proportion of one-third is found suspended; and, as that which adheres as a substratum in the primary region, diminishes one half in bulk under consolidation, the actual bulk measurable is 11,695,817 cubic yards annually,—equal to a layer, if equally spread, of 7 inches. But it is not equally disposed of; certain knovls, margins, and spits of the banks are fed, and these intercepting protuberances elongate after attaining a certain height, thus forming fresh underlays for succeeding banks; and hence the sportive disposition of the channels; an instance of which was remarkably evidenced on the author's developement of the new channel, it being found at right angles to the natural and actual course of tide; which course had been so impeded towards the last part of ebb, by the deposit of matter where the first impetus became slackened, that the vast column, not having power, as it were, to leap the growing banks, turned short off through the most pervious part of the bank, hitherto forming a lateral margin to the main channel, but actually secured, between 1822 and 1832, a new channel of 22 feet depth, of half a mile wide, and one mile long, through sands which, in the interim, had been above water. It is to watching changes that may alike interrupt as facilitate the avenues to this vast commercial port, that Captain

Denham's attention is devoted. This is what we call, in a naval officer, being essentially useful in peace as well as war. How far he blends practical results with scientific research and arrangement, will be manifest in the satisfactory coincidence of results which no longer allows the analysis of passing streams to be hypothetical; for, whilst he shewed in detail that the cubical accumulation and increase of the banks in Liverpool Bay, in the last 14 years, amounted to 160,170,988 yards, he proves the matter detected in transit to be, in the same interval, 151,741,438, leaving 8,429,558 cubic yards as the undetectable portion resulting from the chance deposits of rubbish, unusual freshes, and what the Helbre Smack branch of the Dee sends forth into the Mersey range of the bay, but not through its embouchure. Thus may embouchure observations of every river anticipate the amount of matter transferred from inland valleys to the maritime avenues; but how it is actually disposed of, remains for the marine surveyor to ascertain and portray; and Captain Denham has so mapped it, and arranged his 17 shore and floating lights, landmarks, and beacons, with 58 buoys, that, out of 29,000 vessels entering the port in the last two years, but 19 got into difficulties. And such is the navigable facility now, compared with that of 1832, that her Majesty's packets (whose time of sailing is precisely at low water spring-tides) have gone direct to sea with passengers and mail, with less than thirty instances of transfer by smaller vessels; which delay and miserable inconvenience to passengers amounted to 236 cases in a year. The liberal assistance which Captain Denham acknowledges, so much to the honour of the dock trustees of the port, which has enabled him to render every avenue available at earliest tide,—the new channel having passed 8208 vessels in 1836, 4077 of which would otherwise have been detained six hours at the back of the sands,—carry a requital to the members of the committee; exceeded, however, in pillowed gratification, by the successful duties of the life-boat establishments, under the gallant captain's directions, from Point of Air to Formby, to which is appropriated nearly 1000*l.* per annum by the dock trust, in addition to the 12,000*l.* a-year expended on the pilot waters of their great port, whereby, out of the combined crews of 72 persons, 66 were rescued by the life-boats in the last two years; thus uniting, as it should, humane solicitude with mercantile anxiety. We have given, in the foregoing, as much verbatim report as possible of Captain Denham's address and statement, sparing our readers those detailed calculations and reference to local ground, so highly essential on the spot. He concluded by anticipating an exclamation that, if the deposit went on at the rate quoted, a period might be predicted when the Mersey could not command a ship channel with the ocean. It therefore behoved him to state that, although man could not command the descent of rain, and consequent scouring of valleys and turbidness of the river, yet, on his powers of limiting the tidal boundaries of the estuary, depended the existence of that reflux-impetus at its orifice, which will force the under-water shelves, and a channel through them some where, even to the 14 miles cross linear set of the Irish Sea. But, diminish the back water of the estuary by the slightest displacement of tidal reception which, for want of conservancy guardianship, has been going on, and the port is ruined. Surely, as the noble president, the Marquess of Northampton, Professor Sedgwick, M. De la Beche, Mr. Griffiths, and Mr. Greenough, exclaimed—

"No one will now dispute an appointment of Mersey conservators after this."

#### SECTION G.

In Mr. Russell's first communication, after the explanations of the theoretical principles, and the experiments which formed the basis of his deductions, he proceeded to explain the means by which the navigation of rivers might be facilitated. These means were, the dimensions and form of the channel, and the form of the vessel. To remove the impediment arising from the resistance of the great anterior wave, the depth of the channel should be, as far as possible, increased; this was far more important than any increase of width, no greater width being necessary than would allow the vessels to pass each other with ease and security. Next in point of importance to facilitating the progress of the vessel through the water, was the prevention of the injury done to the banks of the channel by the great posterior breaking surge which follows a vessel and tears down the embankments. This would be diminished, to a certain extent, by the increase of depth, but the evil would be still further remedied by giving to the sides of the channel a proper form. Now, it appeared from the experimental investigations that had been instituted for the determination of this point, that sides, as nearly vertical as possible, were much better than the sloping sides generally adopted, so that a channel as nearly rectangular as possible, would not only remedy these evils, but coincide with the principle of greatest depth previously recommended. A third phenomenon attending the motion of steam vessels, was the wave of excessive displacement. It was this which might be observed rising with a crest of foam at the bow of the vessel when moving with considerable velocity, and, passing outwards past the projecting angle of the paddle-box, might be traced by the eye extending in two straight lines divergent from the bow at a determinate angle. This wave extended its action to a very great distance, and travelled with a velocity of not more than six miles an hour; its effect on small vessels was very considerable, frequently swamping them; upon the shore, it formed a sharp cutting wave, highly destructive to the banks. This wave could be altogether removed. It took its origin in the form of the vessel, and might be removed by proper means applied to that purpose. It arose from the circumstance of the form of the vessel imparting motion to a greater volume of water than was absolutely required for permitting the passage of the vessel. Mr. Russell had seen the wave very much diminished by adopting a certain course in the formation of the vessel, which he described. In two cases, one that of a steam vessel, and the other that of a vessel not moved by steam, he had found that, by the adoption of that course, this injurious result had been entirely removed. Thus, he had shewn the means by which the impediments to the acceleration of the motion of steam vessels in confined channels might be removed, and the evils resulting from their use considerably alleviated or completely removed.

#### TUESDAY.—SECTION A.

The communication of Mr. Russell consisted of 'a Report from the Committee on Waves,' which had been appointed at the last meeting of the Association, and consisted of Mr. Robinson, the secretary of the Royal Society of Edinburgh, and himself. Their duties had been to continue an investigation into the 'Laws of Motion of Waves, and the Nature of the Mechanism of their

Propagation,' in which Mr. Russell had previously been extensively engaged; and, also, to extend their investigation to the 'Principles of Propagation of the Tidal Waves, and the manner in which it is affected by the Dimensions and Form of the Channel, and examine the Effect of the Wind upon the Velocity and Height of the Tide.' An extensive series of experiments had been made upon the mechanism of waves, and the laws of their propagation in channels of different forms. These waves had been generated by different means; by addition of a fluid, by addition of a solid, by protrusion and by impulsion; and it was found that the velocity of the wave, was independent of the mode of generation. This was the great primary wave of translation. Its velocity was that done by gravity, half the depth of the fluid. Its mechanism was peculiar; it affected, simultaneously, the whole breadth of the fluid; its effects were equal throughout the whole depth; the velocity of translation was totally different from the velocity of the wave itself that produced the translation. Its velocity in a given form of channel was determined by a simple process of integration, from considering each element of breadth as moving with the velocity due to half its depth; and this simple law enabled us to determine the velocity of the wave in any channel however irregular. Now, it was found by the observations, that the velocity of the tidal wave, when it became affected by the shores and elements of shallow water, followed exactly the same law. An extensive series of observations had been attained on the river Dee, near Chester, and on the application of Sir Thomas Brisbane, a former president of the Association, privileges had been obtained from the trustees of the river Clyde, which enabled a series of observations most valuable to commerce and to science to be obtained on that river. These led to most satisfactory results. The effect of the wind on the tide had been satisfactorily determined. These had been doubted by M. Daussy, but the results obtained by Mr. Lubbock had been confirmed.

#### SECTION C.

Mr. Faraday occupied the twenty minutes allowed him for the report of what had been done by the annual notices, first, in reading the titles of the communications in the order in which they had been taken; and, after presenting the book of proceedings to the president, next in making a few observations on some of the papers; not so much for the purpose of marking the communications of highest value, as to shew to those members of the Association, not conversant in chemical science, that all parts of that extensive branch of knowledge had been brought before the section. Then, with regard to the means of experimenting, he referred to the display of improved and cheap apparatus made by Mr. Griffin, of Glasgow, and spoke highly of the value of such means for facilitating chemical research. With respect to the investigation of the analogies of bodies, and their right place in any philosophical order of arrangement, he referred to the report on the constitution of salts, made by Professor Graham, in which the new view taken of the nature and action of water, and the analogies of saline bases, one with another, were clearly set forth. As an illustration of the practical results which had come before the section, he quoted Dr. Thomson's report on the analysis of iron obtained by the hot and the cold blast; and also the results obtained by Mr. Hartley, of the preservation of cast and wrought iron when exposed to sea water. He finally re-

marked upon the communication made to the Section by Leeling, in which that philosopher described the means by which he had been able to produce, by artificial methods, a body (al-laritoine) which heretofore had been found only in organic processes, and by the living being; this being the second substance only which, amongst the many formed by the powers of life, has been now produced by artificial means. He concluded by a strong exhortation, in the words of Leeling, to British chemists to pursue organic analysis, a branch of the science hitherto much neglected in this country.

#### EUPHRATES EXPEDITION.

WE regret to have received, too late for notice this week, the *Copy of Instructions to Colonel Chesney, &c.*, printed by order of the House of Commons. We observe that it contains the most satisfactory report that has yet been presented to the public, of the progress and labours of that expedition which has suffered so much for want of publicity; and we propose to ourselves, next week, to give some lengthened details concerning an enterprise we have always felt so much interest in.

#### FINE ARTS. NEW PIGMENT.

THE following is the substance of a communication made by Mr. Brockedon, on a new pigment, to the Society of Arts. The author states that for many years he had been in the practice of using as a pigment the black oxide of manganese; which possesses some most advantageous qualities, particularly those of great body, and an extraordinary readiness to dry. It was originally obtained from the mammillated ore; subsequently it was procured from an oil and colour-house: it is a dark iron gray. A very small quantity will stain a large volume of white; and alone, even when very thin, it will completely obscure light objects beneath it. But its most valuable quality to the artist is its rapid tendency to dry; even when ground in cold-drawn linseed oil, only a few hours are necessary for its hardening. Within these two or three years, however, a new variety of this colour has been introduced from Ireland, being found at Cappah, near Cork, on the estates of Lord Audley; this colour is composed of peat (the material of Vandyke brown) and manganese; the presence of the former greatly enriches the colour. In water-colour it is more intense and beautiful than Vandyke brown, and differs from it in having a greenish brown cast of great richness. For facility of working on paper it is unmatched; but in oil it is still more valuable, because it has the brilliancy and depth of asphaltum, with the quality of drying in a few hours, an advantage of great importance to an artist when he is painting a deep-toned picture, and pressed for time. Both in oil and in water these colours are so essential to Mr. Brockedon, that he says he would now rather discard any single colour that he is acquainted with. But it is not for these finer purposes that the Cappah brown is particularly useful; the West Cork Mining Company have introduced it in large quantities. The consumption of it for art is a mere trifle; for shipping and house painting, however, no colour equal to it has yet been found in depth, richness, and durability. In some cases attempts have been made, by washing it over, to obtain from it two or three different colours, which have been brought into the market under the name of eucrome. To these the remarks in this communication do

not apply, but to the entire substance, without any preparation, except that of grinding.

## NEW PUBLICATIONS.

*Kay's Works; chiefly Edinburgh Portraits: being Original Engravings of about four hundred various Personages.* By John Kay. With Biographical Sketches. In Monthly Parts. Part I. Paton, Edinburgh; Smith, Elder, and Co. London.

KAY, although, technically and professionally speaking, he had little claim to the name of an artist, possessed a very happy facility in discovering the various peculiarities of character, as evinced in the human face and figure, and in transmitting them to paper in so faithful and forcible a manner, that it was impossible to mistake the individuals on whom he exercised this his native and original talent. Kay lived at a fortunate period. To use the words of an able northern contemporary,—"It was an age of transition. Refinement was struggling to gain the ascendancy in a society hitherto composed of feudal barbarism and rude slovenliness, such as we find depicted in the cottagers of Glenburnie, or in Matthew Bramble's account of Edinburgh. The Scottish capital was, moreover, a point to which many noble, and wealthy, and learned, were attracted; but which, having ceased to be the seat of government, had become a rich soil for the growth of humorists. Literature and science were then in their first luxuriant burst; there were Cullen, and Black, and Adam Smith, and Robertson, and Monboddo, and Kames, and Gregory. Along with these sprouted up a plentiful supply of quacks, such as Brown and Graham. The beggars and idiots of those days had an originality of character, and an independence of demeanour which has vanished beneath the influence of mendicancy societies. Lastly, all classes of society were then in a manner closely packed up in the Old Town, not diffused through the wide expanse of the New. Edinburgh was one great carnival from one end of the year to the other; and almost all the characters were supported with the unction of genius. This strange masquerade has been immortalised in three hundred and fifty-six engravings by the kindred genius of Kay." The present number comprehends nine highly amusing plates; most of them containing several portraits. Those of Lord Monboddo, Lord Kames, and Lord Gardenstone, are especially interesting. We will take an early opportunity of advertizing to the "Biographical Sketches" in another part of our publication.

*Portrait of the Right Hon. Joseph Planta, G.C.H. and M.P.* Drawn by J. R. Lane, from a Sketch by J. Slater. Arundale. SLIGHT, but tasteful.

## ORIGINAL POETRY.

## THE QUEEN!

*Written on seeing Chalon's magnificent Portrait of her Majesty.*

BRAVE banners of England, your garlands revealing,

Wave high in the sunlight of freedom serene;  
And come, every heart, with the warm spring of feeling,

Bid Loyalty's voice glad the throne of your  
That brow which the crown of Britannia enwreaths,

Shines pure as the day-star of beauty and  
And where is the form that such dignity breathes,  
So blended with grace and the sweetness of youth?

\* Scottish Monthly Magazine.

Then, maidens of England, shed roses around;  
Bring laurels, ye brave, let your spirit be seen;  
Whilst the song of a nation ascends from the ground—

Victoria for England, and God bless the Queen!

May Wisdom sit firm in her councils—and still  
May the Angel of Mercy descend on her laws:  
Whilst the bold sword of Britain springs forth at her will,

In defence of the right, and for Liberty's  
Oh! ne'er may a shadow her destiny dim;  
But the wing of the dove with the eagle extend;

And defeat, and the world's execration on him  
Who a pang to that breast for a moment would lend!

Then, maidens of England, shed roses around;  
Bring laurels, ye brave, let your spirit be seen;  
Whilst the song of a nation ascends from the ground—

Victoria for England, and God bless the Queen!

C. SWAIN.

## BIOGRAPHY.

## DR. RITCHIE.

It was with much regret that in our last No. we announced the death of this able and distinguished individual at Portobello, on the 15th, after a short illness. It was but a few weeks ago that, in perfect health, he promised a meeting at the British Association in Liverpool: and upon the last day of its active operations he was a lifeless corpse. For real and practical knowledge, Dr. Ritchie had no superior in that assemblage. In various sciences he was intimately skilled, and his general intelligence very nearly embraced the whole circle of the ingenious and useful. As a professor of the London University, and a lecturer at the Royal Institution, he was highly appreciated, for few men had more information to communicate. His reading and writing on scientific subjects, were extensive; and we remember at the Dublin and Bristol Meetings, how impossible it was, in his presence, to bring forward any of those *novelties* which happened to have been previously made known either at home or abroad. Dr. Ritchie was in the prime of life; and his loss will not readily be supplied by equal industry, activity, zeal, and talent.

## DR. UWINS.

ON Friday, the 22d instant, this gentleman died, in his 57th year. He was decidedly a man of talent and originality; but his manner and address were very singular, and, indeed, bordered closely on eccentricity. His pen first brought him into notice, as a contributor to several of the magazines and reviews. He afterwards published treatises on Indigestion, on the Brain, and Nervous System, and on the Theory and Practice of Medicine. His last work was a pamphlet on Homeopathy, in which he defended the doctrines of Hahnemann. This did him considerable injury, both with the public and with the members of the medical profession. Dr. Uwins held many peculiar opinions; for some of which he endured undeserved ridicule: among them, that all mankind had a touch of madness, although the propensity remained latent until any circumstance occurred to bring it forth; when it exhibited itself in some one of its various melancholy shapes.

## SKETCHES.

## A CHAPTER OF ACCIDENTS.

"Go it, ye cripples!"—*Slang Vade mecum.*

ONE *dolce fur niente* day, such a one as at this present writing, I sat at a window of

the North and South American Coffee-house, in Threadneedle Street—the sorta, as it were, springing from the ever-pulsating heart of London; the two ventricles of which may not be inapely considered the Royal Exchange, with its daily buzz, and the Bank of England, with its bullion and bags of pelf. Sitting as above, I was struck by the appearance of three poor cripple gentlemen, who were following each other in the throng. I sympathised with them, and resolved to sit still where I was for two or three hours, and note the halt and maimed who passed that way. I did so from noon till three o'clock, P. M.—the busiest part of the day, doubtless, and this the busiest part of the metropolis. The number was frightfully large. No one but a cripple has the least idea of the vast numbers of persons so afflicted in this great town. There is the gun-shot wound, with his ridiculous walk—something between a jerk and a hop, or rather a succession of both:—a fine looking fellow still, and one who, at this season of the year, never failed to go to the moors. His femoral artery was seriously injured by canister-shot; and, though eminent surgeons believe that such an accident, even where the bone is untouched, demands amputation, the vessel above and below the wound was tied, and the leg saved. There! see that poor fellow, undulating like an S, still trying to look big and *dégaqué*; he slipped on a piece of orange-rind and fractured the neck of his thigh-bone! All cripples fraternise. Suppose that two meet, with only a left leg left a-piece—(though literally correct, it would be cruel to say that they had lost the *right* one)—they will look at each other, nod, then smile; and, if suffering have not chilled the genial current of the soul, a tankard of ale, at the next tavern, is quaffed to the memory of absent members. Nor are these *agréments* confined to the poorer or middling ranks of cripples: "a fellow-feeling makes us wondrous kind." Actuated thus, I sometimes take a "ride" up the river to Chelsea, and sometimes down to Greenwich Hospital, to have a gossip with the placemen and pensioned cripples there. My ancient friend, Tom Bowles, of the latter, at one fell swoop, by a chain-shot, lost his nether extremities, mid-thigh, thirty years ago. Some men, we learn from the "Principles of Military Surgery," will have a limb carried off, or shattered to pieces, by a cannon-ball, without exhibiting the slightest symptoms of mental or corporeal agitation; nay, even without being conscious of the occurrence; and, when they are, they will quietly argue on the probable result of the injury. Cool as a cucumber, this was Tom Bowles' case; but he never hears of "hunting in couples" (alluding to the chain-shot) without a shriek. Tom lost sight of his precious limbs, as he calls them, in the hurly-burly of the battle—very likely they were kicked overboard; but, though he and his legs have parted fellowship so long ago, on every change of the weather he complains of a pain in his toes! Tell us, ye sons of *Æsculapius*! why is this? Does it arise from sympathy, or nervous irritation, or both? Tom was not treated bunglingly after the operation, as he facetiously alludes to the chain-shot; but amputation at that time was followed by the painful process of searing the severed nerves and arteries, which frequently left post-mortem pain, if the phrase be allowed in the present case. I have heard that *tic douloureux*, which occasions a noble and gallant soldier so much annoyance, is, in some degree, to be attributed to his having lost a leg at the last of England's battles. From a mass of scientific memoranda

## LIST OF NEW BOOKS.

I have obtained during past years, at sources not generally open to the public, I find that the acetate of morphine, in minute quantities, applied to the superficies of the neighbouring parts, produces instant and—(I think I have a mark on my notes for the word)—*permanent* relief in cases of this painful class; but, as I am not a professor of the healing art, I do no more here than quote my memorandum. At Chelsea, once, I saw a cripple beggarman; he was not a military cripple; but the brotherly feeling to which I have already alluded, frequently made him go a-begging about Chelsea. The day was nipping cold; Chelsea, too, is always cold; its name importeth cold, being derived from the old Saxon word *Chelchyth*; in addition to this, an easterly wind—that terror of cripples—was blowing violently. With pitiable looks he drew himself up to the open window of a little shop; behind the aperture sat a she-dragon, and, though the apples she cared for were not those of Hesperides, yet were they guarded as vigilantly. The beggar had been in the habit of getting a few *oboli* from the pensioners; he had not, however, that day; poverty and the east wind were piercing him to the bones. With looks full of meaning, and which, though mute, spoke eloquently, he tried to propitiate the savage. He succeeded; for I saw her long and tawny arm reach forward to a basket. Already had the cripple's parched lip, in idea, been refreshed by the scanty juices of the shrivelled dainties before him—alas, no! With a community of feeling, she laid her hand upon a tray containing pieces of flint, and presented the beggar with a shiver of it! It was too small to strike a light; it was destitute even of the pseudo-nourishment of a bit of lead thrown into the mouth. I thought I heard the beggar exclaim, "I asked for bread, and ye gave me a stone." One evening, at the opera house, I sat behind a party of ladies; one of them was exceedingly beautiful—if she were not too pale and interesting. Until that evening I had never seen her. She paid great attention to the opera, and appeared to be perfectly delighted. When the ballet came, she averted her head. The graceful attitudinising of Elslar, the cachouca of Duvernay, and the merry *pas* of little Montessu, to say nothing of Saxon, and the other male dancers, never once made her turn a look to the stage. As she was retiring, at the close, I saw she was—"a cripple."

## DRAMA.

BENEFITS have been the order of the day—night—during the week. Miss Rainforth's on Monday, and Mr. Peake's on Thursday, drew bumpers to the *English Opera House*; and Miss Allison was equally successful at the *Haymarket*, on the latter evening.

The *Adelphi*, *Olympic*, and *St. James's*, commenced their season last night, and *Covent Garden* opens this evening. Each and all of these theatres retain most of the old favourites, but many new faces have been added to the different companies. At the *Adelphi*, Power is a first appearance; Mr. Farren and Mrs. Keeley make their first bows to an *Olympic* audience; at the *St. James's*, a gentleman of the name of Leoni, of whom report speaks lightly, makes his *début* shortly; and the additions at *Covent Garden* are many and judicious.

## VARIETIES.

*Going the whole Hog*.—In the midst of a crowd of persons, slowly making their way into a place of public entertainment, a remarkably

corpulent gentleman, who was closely following a fine girl, amused himself by certain tender squeezes, and amatory whispers, which, at length, so annoyed the fair one, that, turning her head round as far as the circumstances of the case would admit, she exclaimed, with great sharpness of tone, "Be quiet, sir! I wish you would leave me alone." "Very well, my dear," said her plump persecutor; "but, pray, don't eat me." "You are in no danger," replied the nymph; "I am a Jewess."

*Triumvirate of Booksellers*.—Three individuals at this moment have almost monopolised the bookselling trade in Germany. The most powerful of these is Baron Cotta, the proprietor of the "Allgemeine Zeitung." Baron Cotta is likewise the proprietor of six literary periodicals, of a high standing, and of several others of an inferior rank, and is said to have from 300 to 400 editors in his pay. He is proprietor of the copyright of all the works of Goethe, Schiller, Herder, and Uhland. The second of these literary grandees is Reimer, of Berlin, who owns the copyright of all the works of Jean Paul, Tieck, Kleist, Johannes Von Müller, Novalis, and Schlegel. The third is Brockhaus, of Leipzig, proprietor of the "Conversations Lexicon," which alone occupies more than 100 literary men. Brockhaus is likewise the publisher of a most colossal encyclopedia, which, when finished, will consist of at least 200 volumes; and he is now on the point of undertaking the publication of a new daily paper.—*German Journals*.

*Weather Wisdom*.—The predictions for the past week have not been very successful: we try again. "This month opens with a number of aspects, which shew there will be much heavy rain, with storms of wind, hail, and thunder. About the 3d and 4th, we may expect flooding rains. The 5th and 6th stormy."

*Professor Müller*.—We understand that this distinguished physiologist of Berlin, is at present in London, on a visit of scientific research; and that a portrait of him will shortly appear from the pencil of the artist to whom the public are indebted for the spirited and faithful likeness of Tiedemann.

*Egyptian Antiquities*.—Col. Vyse, who has been for some time employed in exploring the antiquities of Egypt, at the pyramids, and the surrounding country, is stated to be on his return home, with an accumulation of very novel and valuable acquisitions.

## LITERARY NOVELTIES.

A French Translation of Mrs. Somerville's admirable work "On the Connexion of the Physical Sciences," has just appeared in Paris, by a Madame Mullen, a Parisian lady devoted to the same pursuits as the accomplished authoress. That the task of translating what Madame Mullen justly calls, in her preface, "la belle et noble production d'une femme que ses talens placent d'une manière si remarquable au-dessus de son sexe, et dont la juste célébrité honore l'Angleterre," has been ably executed, the name of M. Arago, under whose auspices is the work appears, and by whom the whole was revised, is a sufficient guarantee: while this latter circumstance shews the high estimation in which the original is held by the French philosopher.

A new weekly publication is about to make its appearance in London, entitled, "La Mosaïque Française; Recueil Hebdomadaire de Littérature, Sciences, Beaux Arts, &c." We wish it the success which, if the expectations held out in the prospectus be fulfilled, it will no doubt experience.

## In the Press.

An Analytical View of all Religions, by Josiah Conder, Esq.—Holy Scripture Verified; or the Divine Authority of the Bible confirmed by an Appeal to Facts of Science, History, and Human Consciousness. By the Rev. G. Redford, LL.D. (being the Fifth Series of the Congressional Lecture).

A Treatise on Operative Surgery, by W. P. Cocks, Esq. 14s., with 12 Plates.—Dr. W. Kramer on the Nature and Treatment of Diseases of the Ear, translated by J. R. Bennet, M.D., 8vo. 10s. 6d.—Goethe's Correspondence with a Child, 2 vols. post 8vo. 30s.—Journal of a Residence in Norway during the Years 1834, 1835, and 1836, by S. Laing, Esq., 2d edition, 8vo. 14s.—History of England, continued from Sir Jas. Mackintosh's, vol. VII. (forming vol. XCV. of Dr. Lardner's Cabinet Cyclopædia), f. cap 8vo. 6s.—Ernest Maltravers, by the Author of "Pelham," &c., 3 vols. post 8vo. 11. 11s. 6d.—F. W. Krummacher's Glance into the Kingdom of Greece, 18mo. 2s. 6d.—H. Stalman's Treatise on the Law of Copyhold Property, 8vo. 8s.—W. Herbert's History of the Twelve Livery Companies, vol. II. 8vo. 11. 8s.; ditto, large paper, 21. 2s.—Pastoral Recollections, by a Presbyter, 18mo. 2s.—Jairus; or the Home Missionary, by the Rev. J. Young, 18mo. 3s. 6d.—A Winter at De Courcy Lodge, by Mrs. Bourne, 18mo. 3s. 6d.—The Philosophy of Health, by Southwood Smith, M.D., vol. II., 12mo. 7s.—The Works of Jacob Abbott, Complete, in 1 vol. 8vo. 12s.—H. Clutterbuck on Pyrexia, or Symptomatic Fever, 8vo. 5s.—R. D. Grabner on the Structure and Functions of the Spinal Cord, 8vo. 7s.—Letters to Brother John on Life, Health, and Disease, by Edward Johnson, 8vo. 7s.—Lodge's Genealogy of the Peerage, 6th edition, 8vo. 14. 1s.—Lockhart's Life of Sir W. Scott, vol. V., post 8vo. 11s. 6d.—The Earlom Restored, by E. Lakeley, Gent., 2 vols. 12mo. 15s.—A Church of England Psalter, compiled by the Rev. H. Parish, 32mo. 2s. 6d.—An Exact Reprint of the Roman Index Expurgatorius, edited, with a Preface, by R. Gibbins, 18mo. 12s. 6d.—Rev. John Keble's Visitation Sermon, on Tradition, 3d edition, with additions, 8vo. 6s.—The Chemical Decompositions of the London Pharmacopæia, by J. Steggall, M.D. 12mo. 3s.—Celsi de Medicina Opera, edente et curante J. Steggall, M.D. 12mo. 7s.—Peter Parley's Short Stories for Long Nights, square 16mo. 3s.—Affection's Keepsake, 1838, 32mo. 2s. 6d.—Ethel Churchill; or, the Two Brides, by Miss Landon, 3 vols. post 8vo. 14. 11s. 6d.—Roscoe's South Wales, royal 8vo. 48 Plates, 11. 8s. 6d.; Morocco, 11. 15s.—Stories of Spanish Life, from the German of Huber, edited by Lieut.-Col. Craufurd, 2 vols. post 8vo. 11. 1s.—The Life of Sir Edward Coke, by C. W. Johnson, 2 vols. 8vo. 17. 8s.—Proceedings of the Zoological Society, part IV., 1836, 8vo. 6s.

## METEOROLOGICAL JOURNAL, 1837.

September.	Thermometer.	Barometer.
Thursday .. 21	From 39 to 68	29.94 to 29.96
Friday .. 22	.... 39 .. 67	29.97 .. 29.99
Saturday .. 23	.... 41 .. 61	30.02 .. 30.07
Sunday .. 24	.... 35 .. 60	30.12 .. 30.19
Monday .. 25	.... 31 .. 60	30.21 .. 30.24
Tuesday .. 26	.... 30 .. 60	30.20 .. 30.12
Wednesday 27	.... 29 .. 60	30.06 .. 30.01

Wind, N.E.  
 Except the 27th, generally clear; a little rain on the 26th.  
 Rain fallen, .0125 of an inch.  
 Edmonton. CHARLES HENRY ADAMS.  
 Latitude... 51° 37' 39" N.  
 Longitude.. 3 51, W. of Greenwich.

Extracts from a Meteorological Register kept at High Wycombe, Bucks, by a Member of the Meteorological Society, August 1837.

Thermometer—Highest .....	82.00 .. the 17th.
Lowest .....	37.50 .. 29th.
Mean .....	57.20/61
Barometer—Highest .....	30.13 .. 8th.
Lowest .....	29.14 .. 30th and 31st.
Mean .....	29.7203

Number of days of rain, 11.  
 Quantity of rain, in inches and decimals, 3.15.  
 Winds.—4 North-East—3 East—3 South-East—4 South—6 South-West—4 West—3 North-West—4 North.

*General Observations*.—A greater quantity of rain fell during the month than in any August in the preceding seven years, and it all fell in eleven days; the quantities on the 26th and 29th were unusually great. The mean of the barometer was lower than in the same months in 1835 and 1836; but the maximum was higher than any in the last four years, and the range was small. The thermometer was higher than last year, as to the maximum and mean, although it did not reach the elevation of the corresponding months in 1834 and 1835. Lightning was seen on the 19th, and thunder heard on the 30th. On the 26th there was a heavy storm of thunder and lightning, from 11 A.M. until noon; one flash at half-past eleven was extremely vivid, and was followed by a tremendous clap of thunder; after which the storm abated.

## TO CORRESPONDENTS.

G. is not sufficiently finished.  
 Mr. Fennell's paper is under consideration.  
 We will make use of R. E. J. hereafter.  
 Agnes is right.

ERRATUM.—In our last No. page 613, col. 3, l. 62, *for* imparted, read imprinted.

**MR. BULWER'S NEW NOVEL.**

Now ready, in 3 vols. post 8vo.

**ERNEST MALTRAVERS.**

By the Author of "Pelham," "Rienzi," &amp;c.

### REVIEW OF NEW BOOKS.

*Ethel Churchill; or, the Two Brides.* By the Authoress of "The Improvisatrice," "Francesca Carrara," "Traits and Trials of Early Life," &c. &c. 3 vols. 12mo. London, 1837. Colburn.

QUALITY is every thing in novel-writing. Unless there be acute perception, fine feeling, sound judgment, powers of illustration, and originality, we may have a tale, it is true, like *Salisbury Plain*, not unpleasant, though wonderfully long, flat, wide, and undiversified; but at the end of our travel, we shall not be able to remember one distinct feature, nor recall one grateful emotion. Not so when superior talent conceives and embodies human character; peoples the scene with beings so natural and so remarkable that they must live for ever; paints the landscape with all a poet's truth and beauty; and enchains the mind by transitions of fortune, or involutions of circumstances, which are fate, whilst they seem to be only unimportant accidents in the grand petty drama of mortal life. If history be philosophy teaching by example, the skilfully constructed fiction is not less so; nay, being more familiar and domestic, its lessons come more nearly home to the heart; and those who cannot entertain a sympathy with monarchs, heroes, and legislators, readily participate in all the woes and triumphs of individuals moving in their own sphere, and subject to the same casualties which they have themselves experienced. No wonder, then, that this species of literature is so popular; and, we are much mistaken if the present work be not destined to prove one of the most popular of its class, and also to take a rank far higher than mere popularity. The progress of Miss Landon's mind is more distinctly marked in her prose than in her poetical writings. Poetry always appears with her an impulse and an inspiration, luxuriant in imagery, impassioned, and carried away by her subjects: the character of her lyrical writings is singularly distinct from her prose fictions. Her novels are marked by analysis and by purpose. In "*Francesca Carrara*," the end was kept in view from the first; it was obvious that the writer had certain opinions and certain principles to be worked out. The picture was the result of moral investigation. This is even more the case with *Ethel Churchill*; and the narrative is linked with great skill. Every act has its consequence, and that consequence is the moral. The historic picture is carefully drawn; the character of the age colours the character of the individual, while each individual reflects the true abstract of a class. We are at a loss to point to a more finished portraiture than that of Sir Robert Walpole. In Lord Northbourne, we see the worldly, acute, and hardened statesman; yet still, with the strong undercurrent of affections swaying him beneath a smooth and unruffled surface. There is, too, the light, lively, yet sarcastic wit, so exactly that of its time. Nor has Miss Landon, while portraying with exquisite touches the peculiar features of the noble, the learned, and the wealthy, forgotten to call up, in all their vivid reality, the wants and the sufferings of the

poor. These appeals are conveyed with all the force of contrast. We select the highly dramatic scene at Pope's villa.

"It was a very bit of Arcadia, the scene that the lawn presented. A few late flowers lingered among the shrubs, and the rich colouring on the autumnal foliage supplied the place of bloom. The garden was laid out with exquisite taste, and the groups scattered around seemed animated with the spirit of the place; for they placed themselves in little knots, just where they were calculated to produce the best effect. There was an elegant collation ready; and, while Pope talked of

'His humble roof, and poet's fare,'

he had neglected nothing that could please his assembled guests. To Lady Marchmont he was the most interesting object of all, though all his *petite soins* were addressed to Lady Mary Wortley Montague, who received them with that encouraging coquetry born of flattered vanity. Flattery is like champagne, it soon gets into the head; but in Pope's flattery there was too much of the heart. Long after hours of neglect and mortification dearly atoned for that morning's pleasant delusion. There is something in genius for which Fate demands severe atonement. In some things Pope's was an exception to the general lot. He dwelt in that 'lettered ease,' to which his own taste gave refinement; his talents pined in no long obscurity, but early reached their just appreciation; his friends were those whose friendship is honour; and he lived in a very court of personal homage and flattery. But fortune only neglected to do what nature had already done. Dwarfed from his birth, that slender frame was tenanted by acute physical ills; which, acting upon a mind even more sensitive than his body, made life one long scene of irritation and suffering. The fingers were contracted by pain that yet gave the sweetest music to their page: satire was at once his power (and the sense of power is sweet to us all) and his refuge. The passion and melancholy of one or two poems just suffice to shew what a world of affection and sentiment was checked and subdued, because their indulgence had been only too painful; but to-day was to be as flowing as his own verses: he was at her side on whom he lavished so much passionate and graceful flattery; and Lady Mary paid him back,—not in kind, for his heart went with his words, but hers was 'only sweet lip-service.' There is a cruelty in feminine coquetry, which is one of nature's contradictions. Formed of the softest materials—of the gentle smile and the soothing word, yet nothing can exceed its utter hardness. Its element is vanity, of the coldest, harshest, and most selfish order: it sacrifices all sense of right, all kindly feelings, all pity, for the sake of a transient triumph. Lady Mary knew—for when has woman not known?—her power. She knew that she was wholly beloved by a heart, proud, sensitive, and desponding. She herself had warmed fear into hope—had made passion seem possible to one who felt, keenly felt, how much nature had set him apart. If genius for one moment believed that it could create love, as it could

create all else, hers was the fault; she nursed the delusion: it was a worthy tribute to her self-love. 'Truly, her ladyship,' said the Duke of Wharton, 'parades Parnassus a little too much. Does she suppose nobody is to be flattered but herself? Come, Harvey, let us try a little wholesome neglect.' Forthwith they devoted themselves exclusively to Lady Marchmont. Lady Mary's smiles were unmarked, and her witticisms fell dead-weights so far as they were concerned. This was too much for a wit and a beauty to endure. Of what avail was flattery that she only heard herself? She grew impatient till the collation was over, and was the first to step out upon the lawn. Pope did the honours of his garden, which was a poem in itself. He shewed them his favourite willow—fittest tree for such a soil—so pale and tender in its green, so delicate a lining within the leaves; so fragile and so drooping, with so mournful a murmur when the wind stirs its slender branches. The whole scene was marked by that air of refined and tranquil beauty which is the charm of an English landscape. The fields had that glossy green, both refreshing and cheerful; the slight ascents were clothed with trees—some retaining their verdure, others wearing those warm and passionate colours that, like all things coloured by passion, so soon exhaust themselves. Yet what a gorgeous splendour is on an autumnal landscape! The horse-chestnut, with its rich mixture of orange and brown—the sycamore, with its warrior scarlet—the coral red of the small leaves of the hawthorn, mixed together with an oriental pomp; as if the year died, like the Assyrian monarch, on a pyre of all precious things. Winding its way in broken silver, the sunshine dancing on every ripple, the Thames lay at the edge of the grassy sweep. The blue sky, with the light clouds floating on its surface, was mirrored in the depths of the river; but, as if it lost somewhat of its high tranquillity under the influence of our sphere, the reflection was agitated and tremulous, while the reality was calm and still. It is but the type of our restless world, and the serene one to which we aspire: we look up, and the heavens are above, holy and tranquil; we look down on their mirror below, and they are varying and troubled. But few flowers, and those pale and faint, lingered in the garden: these Pope gathered and offered to his fair guests. Lady Marchmont placed hers carefully in her girle. 'I shall keep even the withered leaves as a relic,' said she, with a smile even more flattering than her words. It was well that she engrossed the attention of her host from the dialogue going on between Lord Hervey and Lady Mary. 'You learned the language of flowers in the East,' said he; 'but I thought dwarfs were only the messengers.' 'And such they are now,' replied his listener: 'here is one flower for you,

'The rest the gods dispensed on empty air,' and she flung the blossoms carelessly from her. Pope did not see the action, for he was pointing out a beautiful break in the view. 'I have,' said he, 'long had a favourite project—that of planting an old Gothic cathedral in trees. Tall

poplars, with their white stems, the lower branches cut away, would serve for the pillars; while different heights would form the aisles. The thick green boughs would shed 'a dim religious light,' and some stately old tree would have a fine effect as the tower.' 'A charming idea!' cried Wharton; 'and we all know

'That sweet saint whose name the shrine would bear.' But, while we are waiting for the temple, can you not shew us the altar?—we want to see your grotto.' Pope desired nothing better than to shew his new toy, and led the way to the pretty and fanciful cave, which was but just finished. It was duly admired; but, while looking around, Wharton observed some verses lying on the seat. 'A treasure for the public good,' exclaimed he; 'I volunteer reading them aloud.' 'Nay, nay, that is very unfair,' cried Pope, 'who, nevertheless, did not secretly dislike the proposal.' 'Oh,' replied the duke, 'we will allow for your modesty's sweet, reluctant, amorous delay;' but read them I must and shall.' Then, turning towards Lady Mary, he read the following lines:—

'Ah, friend, 'tis true—this truth you lovers know,  
In vain my structures rise, my gardens grow;  
In vain fair Thames reflects the double scene  
Of hanging woodlands, and of sloping green:  
Joy lives not here: to happier seats it flies,  
And only lives where Worley casts her eyes.'

'Pray, fair inspirer of the tender strains,' let me lay the offering at your feet.' 'Under them, if you please,' said she, her fine features expressing the most utter contempt; and, trampling the luckless compliment in the dust, she took Lord Hervey's hand, and, exclaiming, 'The atmosphere of this place is too oppressive for me,' left the grotto: but part of her whisper to her companion was meant to be audible,—

'A sign-post likeness of the human race,  
That is at once resemblance and disgrace.'

Lady Marchmont was left alone in the grotto with its ill-fated master, and every kindly feeling in her nature was in arms. Affecting not to have noticed what passed, she approached where Pope stood,—speechless, pale with anger, and a yet deeper emotion: she said, in a voice whose usual sweetness was sweeter than ever, with its soothing and conciliating tone,— 'There is one part of your garden, Mr. Pope, which I must entreat you to shew me. I have a dear, kind old uncle at home, who owes you many a delightful evening. He will never forgive me unless I write him word that I have seen

'The grapes long lingering on the sunny wall.'

Pope took her hand mechanically, and led her forth; but the effort at self-control was too much for his weak frame. The drops stood on that pale high brow which was the poetry of his face, and he leant against the railing. 'No!' exclaimed he, passionately, after a few minutes' silence, 'your courtesy, lady, cannot disguise from me that you, too, heard the insult of that heartless woman. Let me speak—I know I may trust your kindness; and, even if you turned into after ridicule the bitter outpouring of this moment's misery, you would but do as others, in whom I trusted, have done. My God! how madly I have loved her—madly indeed, since it made me forget the gulf that nature has set between us—she so beautiful, and I, as she has just said, who only resemble my kind to disgrace it! Yet she sought me first, she led me on, she taught me to think that the utter prostration of the heart was something in her eyes—that a mind like hers could appreciate mind. Fool, fool, that I have been! What have I done, that I should be thus

set apart from my kind,—disfigured, disgraced, immeasurably wretched? Oh! that I might lay my weary head on my mother earth, and die!' 'We could not spare you,' exclaimed Lady Marchmont, taking his hand affectionately,—the tears starting in her eyes; 'but not for this moment's mortification must you forget your other friends—how much even strangers love and admire you. Think of your own glorious genius, and on the happiness which it bestows. I have but one relative in the world: he is an old solitary man; and I think of him with cheerfulness, whenever I send him a new page of yours. I speak but as one of many who never name you but with admiration and with gratitude.' Pope pressed the hand that yet remained in his own. 'God bless you, my dear, kind child! I thank you for calling my power to my mind. She shall learn that the worm on which she trod has a sting.' They loitered a little while, till the irritated host was equal to joining his guests. The boat was ready; and the whole party joined in laughing at Lady Marchmont for her long *tête-à-tête* with Pope. 'I am not jealous,' cried Lady Mary:

'Ye meander beauties, I permit ye shine—  
Go triumph in a heart that once was mine!'

'I think,' said Lady Marchmont, pointedly, 'there has been a little heart in the matter as possible; but you shall none of you laugh me out of my cordial admiration of a man of first-rate genius, and whose personal infirmities call upon us for the kindest sympathy.' 'By Jove! you are right,' cried the Duke of Wharton: 'how much vanity may be pardoned in one who has such cause for just pride! He is building up a noble monument in his language, which will last when we, with our small hopes and influences, are as much forgotten as if we had never been.' 'I see no great good in being remembered,' retorted Lady Mary: 'I would fain concentrate existence in the present. I would forget in order to enjoy. As to memory, it only reminds me that I am growing older every day; and, as to hope, it only puts one out of conceit with possession.' 'All this is very true of our commonplace existences,' replied Lady Marchmont; 'but the gifted mind has a diviner element.'

'How charming is divine philosophy!  
Not harsh, and crabbed, as dull fools suppose.'

exclaimed Lord Hervey with a sneer. 'With the single exception of Lady Marchmont,' said Wharton, 'we have all behaved shamefully to-day. How I will admire the next thing that Pope writes! and, what is more, I will ride over to Twickenham to tell him so; and, having made this compromise with his conscience, the conversation dropped. From that day, however, all friendship was at an end between Lady Mary and Pope. How he revenged himself is well known. His lines yet remain, stamped with all the bitterness of wounded vanity and mortified affection. Strange the process by which love turns into hate. I pity it even more than I blame it. What unutterable wretchedness must the heart have undergone! what scorn and what sorrow must have been endured before revenge could become a refuge and a resource!'

*Sketch of Sir Robert Walpole and his Time.*—'It was a small, but luxurious room, the open windows of which looked to a garden sloping down to the river, clear and sunny, as if the metropolis had been a hundred miles away. Pots, crowded with rare and fragrant exotics, were on the terrace, and filled the apartment with their odours, and the walls around were hung with some of the choicest productions of the Italian school of art: the eye could not be

raised but it must look on a flower or a picture. In the midst stood a table, covered with papers tied up with red tape, books of accounts, and open letters. At one end, that facing the window, sat England's all-powerful minister, wrapped in a loose morning-gown of purple cloth. He was a man of large size, in an indolent attitude, and with that flushed complexion which usually accompanies excess. At the first glance, you only saw one who appeared the idle and good-humoured voluptuary, whose chief attention was given to decide on the merit of rival claret, and whose chief care was to ward off an attack of gout. Not such was the impression produced by a second and more scrutinising look, or when the face before you was lighted by expression. There was decision on the firmly compressed lip, whose subtle smile spoke a world of sarcasm; there was thought on the bold, high forehead; and the mind kindled the depths of those piercing gray eyes. Sir Robert Walpole was essentially the man of his time: no other minister could have maintained the House of Hanover on its then tottering throne. It was opposed to the principles of the many, and entwined with the picturesque prejudices of none. The two first Georges were not men either to dazzle or to interest a people. They were narrow-minded foreign soldiers, fettered by the small etiquettes of small courts; and looked on their accession to the British throne rather as coming to a large property, than as entering on a high and responsible office. Sir Robert Walpole saw at once that loyalty and enthusiasm must be put out of the question; the appeal must be made to common sense, and to self-interest. A man with less worldly shrewdness would never have seen how things really stood; a man with less pliability could never have adapted himself to them. It must always be remembered, that his whole administration was one long struggle: he had to maintain his master on the throne, and himself in the ministry; and this was done by sheer force of talent. He had no alliance among the great nobility on the one hand; and, at all events at first, was no personal favourite with the sovereign on the other; yet he kept his high post through one of the longest and most prosperous administrations that England has ever known. His faults were those of his day, a day singularly deficient in all high moral attributes. Disbelief in excellence is the worst soil in which the mind can work; we must believe, before we can hope. The political creed, of which expediency is the alpha and the omega, can never know the generous purpose or the high result. It sees events through a microscope: the detail is accurate, but the magnificent combination, and the glorious distance, are wholly lost. His age looked not beyond to-day; it forgot what it had received from the past, and what it owed to the future. Rochefoucauld says, and most truly, that hypocrisy is the homage that vice pays to virtue; now, in Walpole's time, it was not worth vice's while to pay even the poor homage of hypocrisy. Political virtue was laughed at; or, at best, considered a sort of Utopian dream that no one was bound to realise. Human interest will always mingle with human motive. To this hour, the great science and duty of politics is lowered by the petty leaven of small and personal advantage: still, no one can deny the vast advance that has been made. Our views are loftier, because more general; and individual selfishness is corrected by the knowledge that good is only to be worked out on a large scale. The many have taken the place of the

few; and a great principle gives something of its own strength to the mind that entertains it. The union of philanthropy and of political science belongs to our own age: every hour the conviction is gaining ground, that happiness should be the object of legislation; and that power is given for responsibility, not for enjoyment. Power is a debt to the people: but as yet we walk with the leading-strings of prejudice, strong to confine the steps, which they never should attempt to guide. Let the child and the nation alike feel their own way; the very stumbles will teach not only caution, but their own strength to recover from them. There is a long path yet before us; but the goal, though distant, is glorious. The time may come, when that intelligence, which is the sunshine of the moral world, will, like the sunshine of the physical world, kindle for all. There will be no tax on the window-lights of the mind. Ignorance, far more than idleness, is the mother of all the vices; and how recent has been the admission, that knowledge should be the portion of all? The destinies of the future lie in judicious education; an education that must be universal to be beneficial. The state of the poor in our country is frightful; and ask any one in the habit of coming in contact with the lower classes, to what is this distress mainly attributable? The answer will always be the same—the improvidence of the poor. But, in what has this improvidence originated?—in the neglect of their superiors. The poor have been left in that state of wretched ignorance, which neither looks forward nor back; to them, as to the savages, the actual moment is every thing: they have never been humanised by enjoyment, nor subdued by culture. The habits of age are hopeless, but how much may be done with the children? Labour, and severe labour, is, in some shape or other, the inevitable portion of mankind; but there is no grade that has not its moments of mental relaxation, if it but know how to use them. Give the children of the poor that portion of education which will enable them to know their own resources; which will cultivate in them an onward-looking hope, and give them rational amusement in their leisure hours: this, and this only, will work out that moral revolution which is the legislator's noblest purpose. One great evil of highly civilised society is, the immense distance between the rich and the poor; it leads, on either side, to a hardened selfishness. Where we know little, we care little; but the fact once admitted, that there can be neither politically nor morally a good which is not universal, that we cannot reform for a time, or for a class, but for all and for the whole, and our very interests will draw us together in one wide bond of sympathy. A mighty change, and, I believe, improvement, is at this moment going on in the world; but the revolution, to work out its great and best end, must be even more moral than political, though the one inevitably leads to the other. Nothing can be permitted to the few; rights and advantages were sent for all: but the few were at the fountain-head in Sir Robert Walpole's time. It is but justice to him to note how much he was in its advance. Nothing could be more enlightened than the encouragement he gave to our manufactories and colonies. Look, also, at his steady preservation of peace; what rest and what prosperity he gave to England. The great want of his administration was, as we have said before, the want of high principle: it was the ideal of common sense, but it was nothing more. Now, mere common sense never does any thing great: the noblest

works of our nature, its exertions, its sacrifices, need some diviner prompting: the best efforts of humanity belong to enthusiasm; but Sir Robert's was not the age of enthusiasm. The revolution, and the exile of the Stuarts, seemed to have exhausted that ardour, and that poetry, which are essentially the characteristics of English history: the chivalric, the picturesque, and the romantic, were put aside for a time to awaken into the higher hope, and more general enthusiasm, of the present. The best proof of their exalting presence among us is, that we believe and hope, where our grandfathers ridiculed and doubted."

"*The Author and the Actress.*—'How beautiful she looked! but how pale!' exclaimed Walter Maynard, who had seen Miss Churchill, the night before, at the theatre; 'and she is not married yet! Is it possible that she can know what it is to have the heart feed upon itself?—to dream, but not to hope? Has she found out the bitter mockery of this weary life, whose craving for happiness is only given that it may end in disappointment? But what is that to me? I must be gay—be witty: the points are not yet thrown into the dialogue in the second act. I wish I could remember some of the things I said last night; but, alas! the epigrams uttered over champagne are like the wreaths the Egyptians flung on the Nile,—they float away, the gods alone know whither. Nevertheless, I must be very brilliant this morning—brilliant! with this pain in my head, and this weight at my heart,' and he drew a sheet of paper towards him. At first, he wrote slowly and languidly; but what had been a passion was now a power, and he soon obtained mastery over his subject. The light flashed in his eyes, the crimson deepened in his cheek; and, tearing the first page, he now began to write rapidly and earnestly. Strange the contrast between the writer's actual situation, and that which he creates! I have been writing all my life, and even now I do not understand the faculty of composition; but this I do know, that the history of the circumstances under which most books are written would be a frightful picture of human suffering. How often is the pen taken up when the hand is unsteady with recent sickness, and bodily pain is struggled against, and sometimes in vain! How often is the page written hurriedly and anxiously,—the mind fevered the while by the consciousness that it is not doing justice to its powers! and yet a certain quantity of work must be completed, to meet the exigencies of that poverty which has no other resource. But there is an evil beyond all this. When the iron of some settled sorrow has entered into the soul,—when some actual image is predominant even in the world of imagination, and the thoughts, do what you will, run in one only channel,—composition is then a perpetual struggle, broken by the one recurring cry, 'Hast thou found me, oh! mine enemy?' Something or other is for ever bringing up the one idea: it colours every day more and more the creations which were conjured up in the vain hope to escape from it. 'I cannot write to-day,' becomes more and more the frequent exclamation. It is, I believe, one of those shadows which deepen on the mind as it approaches to its close. It is a new and a dreadful sensation to the poet when he first finds that 'his spirits do not come when he does call to them' or that they will only come in one which makes him cry, 'take any shape but that.' It is a new sensation to be glad of any little return of power, and a most painful one. Walter now rejoiced whenever he did a morn-

ing's work. Alas! the real was struggling with the ideal. After writing a few pages, he suddenly paused; and, pushing the papers aside, exclaimed, 'What a mockery this is! I do not know myself what I write for. Money!—why should I make more than will hold this miserable alliance firm—just keep body and soul together? and sometimes I ask, is it worth even doing that? Fame!—alas! what would I now give to hope, to believe in it, as I used to do! but it is far off, and cold: it lies beyond the grave. And love—it is a bitter thing to love in vain!—to feel that none will ever know the deep tenderness, the desire for sympathy, the sweet wealth of thought that is garnered in your heart. How passionately I wish to be beloved again! to pour out my whole soul, were it but for a day, and then die!' The emotion exhausted him; for Walter had tried a frame, naturally delicate, too severely. The vigil and the revel, the hour of social excitement, and that of solitary suffering, were alike doing their work. Bodily weakness mastered for a time the mind. The tears filled his eyes, and he closed them; a few moments more, and he was asleep. He had slept for about half an hour when there came a low rap at the door; this did not disturb him: and the applicant, who had a key that fitted the lock, opened, and came in without further ceremony. It was Lavinia Fenton, gaily but richly dressed; the world had gone well with her. She took off her mask and laid it on the table, together with a small basket; and, looking around, saw Walter asleep on the sofa. She bent over him for a few minutes with an expression of anxiety and tenderness, which, for the time, quite subdued the expression of her bold, though fine features. Sleep shewed the change that a few minutes had wrought. The soft brown hair was damp, and the dew stood on the white forehead, where the blue veins were azure as a woman's. You saw the pulses beat in the clear temples, and the chest heaved with the quick throbbing of the heart. The cheek was flushed with rich unnatural crimson; but both around the mouth and eyes hung a faint dark shadow, the surest herald of disease. The hand, too, how white and emaciated it was! yet with a feverish pink inside. The girl leaned over him—vain, coquettish, selfish; the degradation inevitable from her position lowering even more a nature not originally of fine material; yet one spot in her heart was generous, and even pure. She loved him. Had she been beloved again, her whole being would have changed; for his sake she would have done any thing, and could have become any thing. Lavinia was clever—a coarse, shrewd kind of cleverness, quick to perceive its own interest, and unscrupulous in pursuing it. She had no delicacy, no keen feelings that got in her way. She had made great progress on the stage, was a favourite with the public, and, if not happy, was, at all events, often very well amused. Still her heart clung to Walter: she knew that he loved another, that the connexion between themselves was rather endured than solicited on his part; still she had for him a careful and disinterested tenderness, that half redeemed her faults—at least, it shewed that all of good and feminine kindness was not quite extinct within her. She leaned over him, while her eyes filled with tears. 'He is dying,' muttered she, in a low whisper; 'he has too little of this world in him to last long in it,' and she buried her face in her hand. But it was no part of Lavinia's system to fret long over any thing: she was too selfish, perhaps we should say, too thoughtless, for prolonged sorrow. Life

appeared to her too short to be wasted in unavailing regret. It is the creed of many beside our young actress. She rose softly from her knees, flung back the hair that had fallen over her face, dashed aside the tears, and muttered, 'It is that he has not been in bed all night.' She then began to make preparations for breakfast, took the fruit and cream from her basket; and it was the fragrant smoke of the coffee that roused Walter from his sleep. It was curious to note the difference between the two whom circumstances had so thrown together; those circumstances, all that was in common to them. Lavinia—shrewd, careless, clever; ready to meet any difficulty, however humiliating, that might occur; utterly without principle; confident in that good fortune which she scrupled at no means of attaining—was the very type of the real. Walter was the ideal—generous, high-minded, clear in perception; but sensitive, even weak, in action: or, rather, too apt to imagine a world full of lofty aims and noble impulses, and then fancying that was the world in which he had to live."

We had marked many other passages for quotation, but we have already exceeded our limits. The above, however, are specimens of the various talent displayed in these pages. The most finished character is that of Walter Maynard, in whose career is traced the usual fate of genius; poor, depressed, but supported to the last by the glorious consciousness within. There is also some beautiful description of London, though we must remind our author that Northumberland House is not of Gothic architecture. We must conclude by saying, that whether for dramatic interest of story, knowledge of character, wit, or thought, *Ethel Churchill* is far superior to any of Miss Landon's former works.

*Memoirs of the Life of Sir Walter Scott, Bart.*  
Vol. Fifth. Edinburgh, 1837, Cadell; London, Murray, and Whittaker.

THIS is one of the most interesting volumes; for though, as the editor says, "the muffled drum" will soon be heard, it has not been heard—and these pages present a delightful picture of Scott's daily and domestic life. The part we like best is Captain Hall's journal. We do not at all agree with the extreme eulogium passed by the editor, that "Sir Walter Scott was never subjected to sharper observation." For all the mental analysis contained in this journal, Sir Walter, if never exposed to more, had not much to be "subjected" to in the way of "observation." We must also add a doubt of the propriety, to say nothing of the delicacy, of keeping such record of any private society in which you may happen to be introduced. But Captain Hall obviously considers that God created the world to have an account published of it afterwards; and go where he will, do what he will, the result is a book. But a work like the present calls chiefly for extract; and we shall make forthwith our miscellaneous selection.

*Scott and Davy together.*—"His host and he delighted in each other; and the modesty of their mutual admiration was a memorable spectacle. Davy was by nature a poet; and Scott, though any thing but a philosopher in the modern sense of that term, might, I think it very likely, have pursued the study of physical science with zeal and success, had he happened to fall in with such an instructor as Sir Humphry would have been to him, in his early life. Each strove to make the other talk; and they did so, in turn, more charmingly than I ever heard either on any other occasion whatsoever. Scott,

in his romantic narratives, touched a deeper chord of feeling than usual, when he had such a listener as Davy; and Davy, when induced to open his views upon any question of scientific interest in Scott's presence, did so with a degree of clear energetic eloquence, and with a flow of imagery and illustration, of which neither his habitual tone of table-talk (least of all in London), nor any of his prose writings (except, indeed, the posthumous 'Consolations of Travel'), could suggest an adequate notion. I say his prose writings; for who that has read his sublime quatrains on the doctrine of Spinoza can doubt that he might have united, if he had pleased, in some great didactic poem, the vigorous ratiocination of Dryden and the moral majesty of Wordsworth? I remember William Laidlaw whispering to me, one night, when their 'rapt talk' had kept the circle round the fire until long after the usual bedtime of Abbotsford, 'Gude preserve us! this is a very superior occasion! Eh, sirs!' he added, cocking his eye like a bird, 'I wonder if Shakespeare and Bacon ever met to screw ilk other up?'"

*The Abbotsford Hunt.*—"The other 'superior occasion' came later in the season; the 28th of October, the birthday of Sir Walter's eldest son, was, I think, that usually selected for the Abbotsford Hunt. This was a coursing-field on a large scale, including, with as many of the young gentry as pleased to attend, all Scott's personal favourites among the yeomen and farmers of the surrounding country. The sheriff always took the field, but latterly devolved the command upon his good friend, Mr. John Usher, the ex-laird of Toffield; and he could not have had a more skilful or a better-humoured lieutenant. The hunt took place either on the moors above the Cauld-Shiels Loch, or over some of the hills on the estate of Gala; and we had commonly, ere we returned, hares enough to supply the wife of every farmer that attended with soup for a week following. The whole then dined at Abbotsford, the sheriff in the chair, Adam Ferguson croupier, and Dominie Thomson, of course, chaplain. George, by the way, was himself an eager partaker in the preliminary sport; and now he would favour us with a grace, in Burns's phrase, 'as long as my arm,' beginning with thanks to the Almighty, who had given man dominion over the fowls of the air and the beasts of the field, and expatiating on this text with so luculent a commentary, that Scott, who had been fumbling with his spoon long before he reached his Amen, could not help exclaiming as he sat down, 'Well done, Mr. George! I think we've had every thing but the view holla!' The company, whose onset had been thus deferred, were seldom, I think, under thirty in number; and sometimes they exceeded forty. The feast was such as suited the occasion—a baron of beef, roasted, at the foot of the table; a salted round at the head; while tureens of hare-soup, hotch-potch, and cockeyeekie, extended down the centre; and such light articles as geese, turkeys, entire sucking pigs, a singed sheep's head, and the unfailing haggis, were set forth by way of side-dishes. Blackcock and moor-fowl, bushels of snipe, black puddings, white puddings, and pyramids of pancakes, formed the second course. Ale was the favourite beverage during dinner, but there was plenty of port and sherry for those whose stomachs they suited. The quaghs of Glenlivet were filled brimful, and tossed off as if they held water. The wine decanters made a few rounds of the table, but the hints for hot punch and toddy

soon became clamorous. Two or three bowls were introduced, and placed under the supervision of experienced manufacturers (one of these being usually the Ettrick Shepherd), and then the business of the evening commenced in good earnest. The faces shone and glowed like those at Camacho's wedding: the chairman told his richest stories of old rural life, Lowland or Highland; Ferguson and humbler heroes fought their peninsular battles o'er again; the stalwart Dandie Dinmonts lugged out their last winter's snow-storm, the parish scandal, perhaps, or the dexterous bargain of the Northumberland *tryste*; and every man was knocked down for the song that he sung best, or took most pleasure in singing. Sheriff-substitute Shortreed—(a cheerful, hearty, little man, with a sparkling eye and a most infectious laugh)—gave us 'Dick o' the Cow,' or, 'Now Liddesdale has ridden a raid'; a weather-beaten, stiff-bearded veteran, Captain Ormiston, as he was called (though I doubt if his rank was recognised at the Horse Guards), had the primitive pastoral of 'Cowdenknowes' in sweet perfection; Hogg produced 'The Women folk,' or, 'The Kye comes hame,' and, in spite of many grinding notes, contrived to make every body delighted, whether with the fun or the pathos of his ballad; the Melrose doctor sang, in spirited style, some of Moore's masterpieces; a couple of retired sailors joined in 'Bould Admiral Duncan upon the high sea'; and the gallant croupier crowned the last bowl with 'Ale, good ale, thou art my darling!' Imagine some smart Parisian *savant*—some dreamy pedant of Halle or Heidelberg—a brace of stray young lords from Oxford or Cambridge, or, perhaps, their prim college tutors, planted here and there amidst these rustic wassailers—this being their first vision of the author of 'Marmion' and 'Ivanhoe,' and he appearing as heartily at home in the scene as if he had been a veritable Dandie himself—his face radiant, his laugh gay as childhood, his chorus always ready. And so it proceeded until some worthy, who had fifteen or twenty miles to ride home, began to insinuate that his wife and bairns would be getting sorely anxious about the fords, and the Dumbles and Hoddins were at last heard neighing at the gate, and it was voted that the hour had come for *doch an dorraeh*—the stirrup-cup—to wit, a bumper all round of the unmitigated mountain dew. How they all contrived to get home in safety, Heaven only knows! but I never heard of any serious accident, except upon one occasion, when James Hogg made a bet at starting that he would leap over his wall-eyed pony as the stood, and broke his nose in this experiment of 'o'ervauling ambition.' One comely good-wife, far off among the hills, amused Sir Walter by telling him, the next time he passed her homestead after one of these jolly doings, what her husband's first words were when he alighted at his own door—'Aillie, my woman, I'm ready for my bed! And oh, lass (he gallantly added), I wish I could sleep for a tow-mont; for there's only ae thing in this world worth living for, and that's the Abbotsford hunt!'"

*Business, and Messrs. Constable.*—"Sir Walter concluded, before he went to town in November, another negotiation of importance with this house. They agreed to give for the remaining copyright of the four novels published between December 1819 and January 1821—to wit, 'Ivanhoe,' the 'Monastery,' the 'Abbot,' and 'Kenilworth'—the sum of five thousand guineas. The stipulation about not revealing the author's name, under a penalty of

2000*l.* was repeated. By these four novels, the fruits of scarcely more than twelve months' labour, he had already cleared at least 10,000*l.* before this bargain was completed. They, like their predecessors, were now issued in a collective shape, under the title of 'Historical Romances, by the Author of Waverley.' I cannot pretend to guess what the actual state of Scott's pecuniary affairs was at the time when John Ballantyne's death relieved them from one great source of complication and difficulty. But I have said enough to satisfy every reader, that, when he began the second, and far the larger, division of his building at Abbotsford, he must have contemplated the utmost sum it could cost him as a mere trifle in relation to the resources at his command. He must have reckoned on clearing 30,000*l.*, at least, in the course of a couple of years, by the novels written within such a period. The publisher of his Tales, who best knew how they were produced, and what they brought of gross profit, and who must have had the strongest interest in keeping the author's name untarnished by any risk or reputation of failure, would willingly, as we have seen, have given him 6000*l.* more, within a space of two years, for works of a less serious sort, likely to be despatched at leisure hours, without at all interfering with the main manufacture. But, alas! even this was not all. Messrs. Constable had such faith in the prospective fertility of his imagination, that they were by this time quite ready to sign bargains and grant bills for novels and romances to be produced hereafter, but of which the subjects and the names were alike unknown to them and to the man from whose pen they were to proceed. A forgotten satirist well says,

'The active principle within  
Works on some brains the effect of gin';

but in his case, every external influence combined to stir the flame, and swell the intoxication of restless exuberant energy. His allies knew, indeed, what he did not, that the sale of his novels was rather less than it had been in the days of 'Ivanhoe'; and hints had sometimes been dropped to him, that it might be well to try the effects of a pause. But he always thought—and James Ballantyne had decidedly the same opinion—that his best things were those which he threw off the most easily and swiftly; and it was no wonder that his booksellers, seeing how immeasurably even his worst excelled in popularity, as in merit, any other person's best, should have shrunk from the experiment of a decisive damper. On the contrary, they might be excused for from time to time flattering themselves that if the books sold at a less rate, this might be counterpoised by still greater rapidity of production. They could not make up their minds to cast the peerless vessel adrift; and, in short, after every little whisper of prudential misgiving, echoed the unflinching burden of Ballantyne's song—to push on, hoisting more and more sail as the wind lulled. He was as eager to do as they could be to suggest—and this I well knew at the time. I had, however, no notion, until all his correspondence lay before me, of the extent to which he had permitted himself thus early to build on the chances of life, health, and continued popularity. Before the 'Fortunes of Nigel' issued from the press, Scott had exchanged instruments, and received his booksellers' bills, for no less than 'four works of fiction'—not one of them otherwise described in the deeds of agreement—to be produced in unbroken succession, each of them to fill at least three volumes, but with proper saving

clauses as to increase of copy-money, in case any of them should run to four. And within two years all this anticipation had been wiped off by 'Peveril of the Peak,' 'Quentin Durward,' 'St. Ronan's Well,' and 'Redgauntlet'; and the new castle was by that time complete, and overflowing with all its splendour; but by that time the end also was approaching!"

*The Use of Gas.*—"The effect of the new apparatus in the dining-room at Abbotsford was at first superb. In sitting down to table, in autumn, no one observed that in each of three chandeliers (one of them being of very great dimensions) there lurked a little tiny bead of red light. Dinner passed off, and the sun went down; and suddenly, at the turning of a screw, the room was filled with a gush of splendour worthy of the palace of Aladdin; but, as in the case of Aladdin, the old lamp would have been better in the upshot. Jewellery sparkled, but cheeks and lips looked cold and wan in this fierce illumination; and the eye was wearied, and the brow ached, if the sitting was at all protracted. I confess, however, that my chief enmity to the whole affair arises from my conviction that Sir Walter's own health was damaged, in his latter years, in consequence of his habitually working at night under the intense and burning glare of a broad star of gas, which hung, as it were, in the air, immediately over his writing-table."

*The Pleasures of Planting.*—"You can have no idea of the exquisite delight of a planter; he is like a painter laying on his colours,—at every moment he sees his effects coming out. There is no art or occupation comparable to this; it is full of past, present, and future enjoyment. I look back to the time when there was not a tree here, only bare heath: I look round and see thousands of trees growing up, all of which, I may say almost each of which, have received my personal attention. I remember five years ago looking forward, with the most delighted expectation, to this very hour, and as each year has passed the expectation has gone on increasing. I do the same now; I anticipate what this plantation and that one will presently be, if only taken care of, and there is not a spot of which I do not watch the progress. Unlike building, or even painting, or indeed any other kind of pursuit, this has no end, and is never interrupted, but goes on from day to day, and from year to year, with a perpetually augmenting interest. Farming I hate. What have I to do with fattening and killing beasts, or raising corn only to cut it down, and to wrangle with farmers about prices, and to be constantly at the mercy of the seasons? There can be no such disappointments or annoyances in planting trees."

What a subject for one of Scott's own ballads in the following legend!

"There was," said he, "a very merry party collected in a town in France, and amongst all the gay lords and ladies there assembled, there was none who caused so great a sensation as a beautiful young lady, who danced, played, and sang in the most exquisite style. There were only two unaccountable circumstances belonging to her: one was that she never went to church nor attended family prayers; the other, that she always wore a slender black velvet band or girdle round her waist. She was often asked about these peculiarities, but she always evaded the interrogatories, and still by her amiable manners and beauty won all hearts. One evening, in a dance, her partner saw an opportunity of pulling the loop of her little black girdle behind. It fell to the ground, and immediately the lady became pale as a sheet—then gradual-

ly shrunk and shrunk—till at length nothing was to be seen in her place but a small heap of gray ashes!"

Gratitude for an unexpected benefit, or a marriage under very peculiar circumstances:

"My cousin, Watty Scott," said he, "was a midshipman some forty years ago in a ship at Portsmouth; he and two other companions had gone on shore, and had overstaid their leave, spent all their money, and run up an immense bill at a tavern on the Point. The ship made the signal for sailing; but their landlady said, 'No, gentlemen, you shall not escape without paying your reckoning:' and she accompanied her words by appropriate actions, and placed them under the tender keeping of a sufficient party of bailiffs. They felt that they were in a scrape, and petitioned very hard to be released. 'No, no,' said Mrs. Quickly, 'I must be satisfied one way or t'other: you must be well aware, gentlemen, that you will be totally ruined if you don't get on board in time.' They made long faces, and confessed that it was but too true. 'Well,' said she, 'I'll give you one chance. I am so circumstanced here that I cannot carry on my business as a single woman, and I must contrive somehow to have a husband—or, at all events, I must be able to produce a marriage certificate; and, therefore, the only terms on which you shall all three have leave to go on board to-morrow morning is, that one of you consent to marry me. I don't care a d—n which it is; but, by all that's holy, one of you I will have, or else you all three go to jail, and your ship sails without you!' The virago was not to be pacified; and the poor youths, left to themselves, agreed after a time to draw lots, and it happened to fall on my cousin. No time was lost, and off they marched to church, and my poor relative was forthwith spliced. The bride, on returning, gave them a good substantial dinner and several bottles of wine a-piece, and, having tumbled them into a wherry, sent them off. The ship sailed, and the young men religiously adhered to the oath of secrecy they had taken previous to drawing lots. The bride, I should have said, merely wanted to be married, and was the first to propose an eternal separation. Some months after, at Jamaica, a file of papers reached the midshipmen's berth; and Watty, who was observed to be looking over them carelessly, reading an account of a robbery and murder at Portsmouth, suddenly jumped up, in his ecstasy forgot his obligation of secrecy, and cried out, 'Thanks be to God, my wife is hanged!'

*Romantic Story of a projected Robbery at Birmingham.*—"I like Bolton," continued Sir Walter; 'he is a brave man; and who can dislike the brave? He shewed this on a remarkable occasion. He had engaged to coin, for some foreign prince, a large quantity of gold. This was found out by some desperadoes, who resolved to rob the premises; and, as a preliminary step, tried to bribe the porter. The porter was an honest fellow: he told Bolton that he was offered a hundred pounds to be blind and deaf next night. 'Take the money, was the answer, and I shall protect the place. Midnight came: the gates opened as if by magic; the interior doors, secured with patent locks, opened as of their own accord; and three men, with dark lanterns, entered, and went straight to the gold. Bolton had prepared some flax steeped in turpentine: he dropped fire upon it; a sudden light filled all the place, and, with his assistants, he rushed forward on the robbers. The leader saw in a moment he was betrayed, turned on the porter, and, shooting him dead, burst through all

obstruction; and, with an ingot of gold in his hand, scaled the wall and escaped.' ”

### ORIGINAL CORRESPONDENCE.

#### EUPHRATES EXPEDITION.

Copy of Instructions to Colonel Chesney, together with Abstract of Correspondence, and Accounts of Expenditure relative to that Enterprise. Ordered by the House of Commons to be printed, 17th July, 1837.

THE present Report contains much valuable and authentic matter concerning an expedition in which we have always taken the greatest interest, and of which we gladly avail ourselves, to ascertain the causes of the breaking up of the enterprise, and of the general feeling that has gone abroad of its failure in accomplishing its proposed object.

The letter of instructions from the Duke of Wellington to Colonel Chesney, is of a general nature; that from Lord Ellenborough appears only to notice a *descent* of the river Euphrates, in the event of which, and the season being favourable, the steam-boats were to proceed to Bombay. The original grant for the expedition amounted to 20,000*l.* and this subsequently was, by the purchase made of the two iron steam-boats by the East India Company, increased by 5000*l.* The difficulties which were met with by the expedition at the outset—from the opposition of the government in Syria, by which a hastened transit of the vessels, engines, and their *matériel*, across the land from the Mediterranean to the Euphrates at Bir, was converted into a laborious and expensive undertaking—which occupied nearly one year's incessant exertion, is well known to the readers of the *Literary Gazette*. Sympathising with these trials, and more especially with the serious illness of Colonel Chesney, and of many of his officers and men, a further grant of 5000*l.* was made by his majesty's government early in the ensuing year. The expedition had not, however, yet taken its departure; and, wearied with such long procrastination, an accumulation of expense, and an erroneous report that the descent would not commence till May; ministers, whose patience had been so long tried, withdrew from the responsibility, and such measures were directed to be taken as might be practicable to terminate the expedition by the 31st of July, 1836.

At this anxious moment fortune favoured the expedition; the steam-vessels were floating down the river by the 17th of March, the commander's letters once more breathed hope and confidence, and Sir John Hobhouse, in a letter full of feeling (1st June, 1836), authorised the objects of the mission to be pursued until the end of January, 1837. The ascent of the Euphrates was now also contemplated by his majesty's ministers, and despatches were to be sent out by the Tartarus steam-vessel, by the period calculated for the return of the steamers.

It was under these auspicious circumstances that Providence visited the expedition with the melancholy loss of the Tigris steam-boat, and of so many valuable lives. By this event the enterprise was deprived of the only vessel upon which it could rely for a reascent of the Euphrates river during the low season, should the time already elapsed drive it to that period before the Indian mail should be received. The condolences of his late majesty upon the sad bereavement, as recorded in the report before us, do honour to his head and heart.

The Euphrates steamer reached Basra on the 19th of June, without any further accident, passing through the redoubtable Lemloom marshes, where the channel was, by many, sup-

posed to be lost, every where (with one or more trifling exceptions) meeting with kindness and good feeling on the part of the natives, having received tokens of submission from intelligent agricultural tribes, made peaceful alliances with the restless Bedouins, and bartered goods with the residents in communities. The prospects of the navigation of the river Euphrates stood, indeed, in a very different light to what they had been a year ago!

We gather from a letter of Colonel Chesney's, dated so far back as March the 18th, that he proposed to commence the ascent of the river with an Indian mail by the 9th of July, and we find this intention reiterated in his letter of May 20th, on the occasion of the loss of the Tigris, and again on his arrival at Basra, on the 19th of June.

The anticipated absence at Basra of all facilities for ship construction, so strongly urged by the commander against those who advocated the putting together the steamers at that end of the river, had too plainly manifested itself where repairs, we believe, had become actually necessary; and under these circumstances, although the Euphrates was not, by her construction, adapted for the sea, as the weather was yet fine, Colonel Chesney determined upon crossing the head of the Persian Gulf to Bushire, and there obtain his refitting, and a supply of provisions, now exhausted. We mention this, because, in a letter, dated 30th November, 1836, Sir John Hobhouse expresses, in the most candid manner, how much he will be disappointed if, by waiting for the despatches, the opportunity should be lost of performing “that which is generally, although, perhaps, unjustly, considered as being the most important, and the most difficult part of the enterprise,” viz. the reascent of the river.

The mail from India did not make its appearance in Bushire at the time that was expected by Colonel Chesney, which was somewhere about the 11th of July. The water, as we learn from his letter of June 19th, had been falling ever since the expedition left Beles, and fearful lest the continued delay of the mail from Bombay might prevent the ascent until the water should be too low for the vessel (letter of July 24th), the commander proceeded across the Gulf to Graine, in order to provide means to bring down the London mail for India from Aleppo.

At length the Sir Henry Compton, having made the passage during the south-west monsoon in twenty-four days, arrived, bringing the intelligence that the Shannon schooner had left Bombay with despatches on the 5th of July, eleven days before the transport. Colonel Chesney lost no time in finishing the preparations of the steamer, and she was ultimately taken in tow by the Hon. East India Company's sloop of war, *Elphinstone*, as far as to the mouth of the river, where, the steam being put on, she sailed up to Mohammera, at the mouth of the Karoon.

Never idle when an opportunity afforded itself of completing the various objects connected with the expedition, and which included the survey of the rivers connected with the Euphrates, and the countries adjacent thereto, Colonel Chesney turned the period of waiting for the Shannon to account by attempting an ascent of the Karoon, which was effected to a considerable distance, and, subsequently, an exploration of the Bahamsheer was made.

On Thursday, September 13th, the Shannon anchored off the mouth of the Mohammera channel, having a home mail, with despatches

for the expedition and for the Baghdad Residency, and which brought word that a further mail might be expected by the end of the month. Under these circumstances, the Shannon was despatched to Graine, to take up the London mail, for which arrangements had been made to be conveyed to that spot, but which were unfortunately thwarted with regard to time, by the dromedary falling sick; while Col. Chesney, buoyed up with the hope of conveying the letters to be brought by the Hugh Lyndsay up the line of the Euphrates,—“an important matter,” he observes, in his letter of the 15th August, 1836, on which “I feel some doubt with reference to the decrease of water,”—and guided by private intelligence received of the state of the upper countries, having no reference to the Arabs (see “General Statement of the Labours and Proceedings,” &c.), resolved upon attempting the ascent of the yet unexplored Tigris to Baghdad, with the Shannon mail, which was to be transmitted from that city, and the descent in time for the mail expected by the Hugh Lyndsay. This was accomplished; but, unfortunately, the death of the engineer, and the Arabs sent from Baghdad to cut wood having failed, the time was prolonged. On the return, the coal-boats having got into disputes with the Arabs, were forced to retrace their steps to Korna; and, by these untoward events, which could only happen in a first and experimental navigation, the Euphrates only arrived at Korna by the 16th of October, the Hugh Lyndsay having preceded her by twelve days.

The river was now at her very lowest. Nothing daunted, however, Col. Chesney took on board two passengers, cleaned the engine, shipped his coals, and started up the river Euphrates the ensuing day. Owing to an unfortunate misunderstanding which had taken place between the Arabs and the Hugh Lyndsay, on account of her having brought up with her, as passenger, a person well known in these districts for his religious ardour, and upon which subject we observe some judicious observations in the letter of Major Estcourt to Colonel Chesney, p. 48, a visit to the Sheikh of Montefide was necessitated; but it did not delay the steamer long. By the letter dated 28th Oct., we find the vessel engaged in the Lemloom marshes, where her paddles were obliged to be unhipped, and herself warped through the narrow channel, until the 30th, when a serious crack in the cross-head of the larboard air-pump took place, occasioned by some gravel, which, having been sucked in at the bottom of the air-pump, had obstructed its free working.

Under these circumstances, it was necessary to abandon the attempt at an ascent at so late and unfavourable a season of the year. Mr. Fitzjames was sent on with the mail in a native boat, and the two passengers took the same opportunity of proceeding onwards on their journey. The party was subjected, however, to a “systematic pillage” by the Arabs of Lemloom (letter of Mr. Fitzjames, to Sir John Hobhouse, 14th January, 1837), and a loss of money, jewels, and curiosities from India, estimated at about 400*l.*, was sustained. The mails were not opened, and ultimately Mr. Fitzjames arrived in safety with them at Malta, from whence they were forwarded to England.

The Euphrates returned along side the Hugh Lyndsay to get her repairs made; and still apparently anxious that time and opportunity might be given for an ascent of the river during the approaching high season, Colonel Chesney resolved upon proceeding to Bombay, leaving the steamer under the command of Major

Estcourt, with instructions, by following which important services might be rendered to geography, to history, and to the general objects of the expedition, previous to the time which would be most appropriate for an ascent of the river Euphrates.

On the 14th of November, Colonel Chesney left the Euphrates steamer to go on board the *Hugh Lyndsay*, and the former sailed for Mohammera. Here she was detained five days waiting for coal from Basra, when she commenced the ascent of the Karoon, while another party proceeded by the Dorack canal to Felahia, the seat of the Sheik of Dorack, and from thence by land across to Hawaz, which they reached on the 23d November, and found the steamer already anchored beneath several formidable ledges of rock, which cross the river at this place, and form an almost insuperable bar to steam navigation.

The party prepared then to proceed up the river in a native boat, which they did by Weiss to Bendekill, at the junction of the Des river and the Karoon, when, according to the letter of Major Estcourt to Sir John Hobhouse, of 20th December, 1836, tribute was demanded and refused; and, after a scuffle to bring the anchor on board, the boat was allowed to return without having accomplished the great object of the mission, which, according to the instructions, we find to be the very important determination of the true position of Sus, and the clearing up the many doubts which hang upon the different rivers of Susiana. Many points of great interest to historical and to descriptive geography were, however, obtained by this interrupted expedition.

On the 3d of December, the steamer left Hawaz, arrived at Mohammera the 5th, explored the Bahamaheer the 6th and 7th, and sailed up to Basra the 9th. It appears from Major Estcourt's letters, that the steamer left Korna on the 13th of the same month for the Tigris, and on the first day's journey overtook a coal-boat, which had been stopped by the Arabs, and an hour afterwards a second boat in the same predicament. Both boats were taken in tow, a scene which excited the wonder of the Arabs beyond all description, and the steamer arrived in safety at Baghdad the 26th December.

Little intelligence has yet been communicated to the public regarding the latest proceedings of the expedition, and what occurred subsequently to its breaking up. As we have much interesting matter upon these subjects, we shall defer their further notice until next week, when we shall, also, take up some practical points, as the consumption of coals, the formation of dépôts, and their security, and the opinions formed upon the practicability of the navigation of the Euphrates by the different officers, compared with other routes.

#### ARTS AND SCIENCES.

##### THE BRITISH ASSOCIATION.

##### SEVENTH MEETING: LIVERPOOL.

(Fourth notice.)

On Thursday, all the Sections continued their labours with unremitting activity, not, perhaps, excepting the Natural History body, which went to Lord Derby's, and, in spite of a wet day, not only enjoyed the sight of his lordship's fine collection, but, also, of his fine collation.

#### SECTION A.

Mr. Lubbock read a report of the committee appointed at the last annual meeting, for the purpose of preparing empirical tables of the moon. The report complained of the very few

observations of the moon which had been reduced and were available for the purpose of forming the required tables, and suggested the expediency of encouraging such observations for the future. Sir W. Hamilton thought the object contemplated by the committee was one which might very properly be urged on the attention of government.

Professor Henry then read an interesting paper 'On the Lateral Discharge in Common Electricity.' He observed, that when a discharge took place from the Leyden jar by a perfect conductor, there was at the same time a slight lateral discharge from the jar itself; and entered into a variety of details to shew the different phenomena to which this lateral discharge gave rise.

Professor Stevaley remarked that this subject was of the greatest importance, as affording a clue to the connexion of certain phenomena in galvanic electricity, with others pertaining to common electricity.

The learned Professor then read a paper by Sir D. Brewster, 'On the Crystalline Lens.'

Dr. Reade read a paper 'On the Production of a Permanent Soap-bubble, for shewing Newton's Rings.' Dr. Reade's plan was, to take a small phial with about two ounces of a solution of Castilian soap, in distilled water, and, after inserting the phial in boiling water, until a vapour was generated which filled the bottle, he then closed the mouth of the bottle, and immediately condensed the vapour, which left a perfect vacuum in the upper part. Then, by a certain manipulation, bubbles might be created in the bottle, which would remain sufficiently long for the purpose of being submitted to investigation.

Professor Christie read a paper 'On the Aurora Borealis, in Summer.' It was a singular phenomenon that the aurora borealis should have made its appearance in summer, as it did last year; respecting which, he related a variety of curious particulars. It was remarkable that there had not been a single month during the year which had not afforded an aurora. One very extraordinary circumstance took place on one of these occasions, when certain dark arches seemed to break through, and cause the disruption of the luminous arches. Allusion was also made to the disturbance of the magnetic influence, which took place simultaneously with the appearance of the aurora, and which had been observed, in one case, both by Professor Christie in England, and Professor Henry in Albany, America, at the very same time. It was suggested, as an object worthy of investigation, by the members of the association, that observations should be made on the appearance of the dark and luminous arches in the aurora borealis, with a view to determine the connexion of the phenomena with those of magnetism.

Mr. Snow Harris read a report on the subject of meteorological observations made by him at Greenwich, during the last five years. Dr. Lloyd announced that similar observations would be shortly undertaken in Ireland, under the superintendence of the officers of the survey.

Mr. Southwood read a report of the observations made by him at Plymouth, on Mr. Whewell's anemometer; in the course of which, he suggested a variety of improvements in the construction of the machine.

Sir D. Brewster read a paper 'On a New Property in Light discovered by him.'

Professor Lloyd produced a report on simultaneous observations on the horizontal needle.

Captain Denham, R.N., then proceeded to exhibit his improved mode of producing a red

light in light-houses. This gave rise to considerable discussion, in which Professor Faraday and Sir David Brewster took part. They could not question the fact of a brighter light being produced, but they seemed to doubt the optical principles upon which it was endeavoured to be accounted for.

#### SECTION B.

Mr. Faraday, in the chair, directed the attention to the importance of the paper about to be read; viz., the 'Report by Dr. T. Thomson, of Glasgow, on the comparative Analysis of Iron as manufactured by the hot and by the cold blast.' Our readers will observe that this subject, of so much interest to iron-masters, as well as to every manufacturer who uses machinery, was also discussed at great length in the Section of Mechanics, where it was ably brought forward by Mr. Fairbairn. The details, in both cases, are minute and complicated; and, though, after all the experiments being made, on iron of different kinds, and of different component parts, it was obvious that no certain determination could be come to on the subject, still the approximation towards practical results, and the accumulation of data for future experiments, are among the valuable contributions to useful science made at this meeting; and the further grant of a sum of money for the continuance of the inquiry shews, at once, that it still needs to be prosecuted, and has not arrived at a more satisfactory conclusion than this, that much depends upon the quality of the iron. One sort does better under the hot blast, and another under the cold. Mr. Fairbairn's experiments were tried on Welsh iron; Dr. Thomson's, on Scotch.

Dr. Thomson said this analysis had been undertaken in consequence of the difference of opinion which had prevailed at Bristol, at the last meeting of the Association, upon the comparative advantages of these blasts. He did not know what had been done by Drs. Dalton and Henry (named on the committee with him), for, living at a great distance from these gentlemen, he took it for granted that it was intended that each individual should make separate experiments. A great quantity of cast iron was made near Glasgow, amounting annually to 200,000 tons. Glasgow was surrounded by one of the richest coal fields, and the iron ore near was of chloride quality. Of this ore he had analysed more than 30 different specimens, selected with great care. In general, some notion might be formed of the goodness of ore by its specific gravity,—the higher the gravity the better the ore; but this rule was not without exceptions, as the heaviest ore he met with was alloyed with a mixture of coal, by which its value was depreciated. The heaviest iron-stone he had met with in the neighbourhood of Glasgow, had a specific gravity of 3.880; but the richest ore in that neighbourhood was 3.056. It contained the following substances:—

Carbonate of Iron .....	85.44
Lime .....	5.54
Coal .....	3.03
Ferrous oxide of iron .....	0.22
Carbonated Magnesia .....	3.71
Silicium .....	1.40
Aluminium .....	0.63

or nearly 85½ per cent of iron. The quantity of silicium and aluminium was peculiarly small, amounting only to two per cent, although, in some specimens of iron-stone, it existed to the extent of 45 per cent. In a bed of iron-stone found near Johnstone, there was 85 per cent of iron, and 12½ per cent of aluminium and silicium. The lightest specimen of iron-stone he had met with, was 2.285, and contained no more than 39 per cent of iron. Before the ore is put into

the furnace, it is always roasted to drive off the carbonic acid, which reduced it 35 per cent. Lime is then introduced with it in the furnace as a fluid. The purest limestone used contained 24½ per cent of calcium. The coal used for fuel gave 10 per cent of ashes. Coal was seldom quite free from pyrites, which accounted for the quantities of sulphur formed in cast iron. When iron was smelted in former times, 10 tons of coal were required for the reduction of one ton of iron. In 1823, when the mode of heating the air was brought into operation, and blasts sufficiently hot to melt lead were introduced into the furnace, 2 tons 19 cwt. were only required for the same purpose, 19 cwt. of which were consumed in heating the air, and in heating the boilers of the steam-engine used. He considered that coals were used with more economy in the hot than in the cold blast, because by the cold blast the heat was carried up the chimney and dispersed, whilst in the hot the heat was instantaneously communicated to the iron-stone. This greater concentration of combustion must melt the iron in a greater degree; this accounts for the smaller quantity of lime required for fusing the clay, and thence the greater quantity of cast iron obtained from a furnace in a given time. The Carron iron-works supplied him with specimens of No. 1 iron, made from hot and cold furnaces. The Carron Company had the reputation of making cast iron of very good quality. The specific gravity of cast iron, smelted by cold blasts, is less than that smelted by hot blasts. The following was the gravity of a number of specimens of No. 1 cast iron, smelted by the cold blast, obtained from different furnaces: 5 from Muirkirk, of the following specific gravity: 6·410—6·435—6·493—6·579—6·775. Pyrites, 6·9944. From the Carron foundry, 6·9888. Clyde works, 7·008. In all these specimens of cast iron, other ingredients were found besides iron. Manganese was pretty generally present, in minute quantities. In one specimen it, however, amounted to 7 per cent, but the average was 2 per cent. Silicon was never wanting, its average being 1½ per cent, though some iron contained as much as 3½, whilst others contained only ½ per cent. Aluminium averaged 2 per cent, sometimes, however, reaching 4½ per cent, whilst in other cases it only amounted to 1000th part. Calcium and magnesium likewise were found in minute quantities; they were not quite free from common pyrites. The following table will shew the proportions in which those substances existed in the different specimens analysed:—

	Muirk.	Do.	Pyrit.	Carr.	Clyde	Mean.
Iron .....	90·98	90·2	91·38	89·4	94·01	90·82
Copper .....	..	..	..	0·28	..	..
Manganese ..	..	7·14	2·00	..	0·635	2·46
Sulphur .....	..	..	..	..	0·04	..
Carbon .....	7·40	1·71	4·88	3·6	3·1	3·855
Silicium .....	0·46	0·8	1·1	3·2	1·0	0·45
Aluminium ..	0·48	0·16	..	3·77	1·03	4·6
Calcium .....	..	0·01	0·2	..	..	..
Magnesium ..	..	..	..	..	0·34	..

Nothing was more astonishing than the differences in the quantity of carbon, which existed in various proportions even when smelted at the same place. He had examined some hot iron said to have been Swedish, the specific gravity of which was 7·663, but which, owing to the presence of sulphur, which did not occur in Swedish, he did not believe to be such. Mr. Tennent had examined a specimen of cold-blast iron, No. 2, which contained 90½ per cent of iron. He had analysed five specimens of hot-blast iron, two of which were the Carron, and three from the Clyde iron-works, where the hot blast was first used, the specific gravity of which were, 7·0028—7·0721—1·1022—1·622—

while 7·0623 was the mean. The following table shews their constitution:—

	Clyde.	Carr.	Carr.	Clyde.	Clyde.
Iron .....	97·09	90·42	96·09	94·96	94·340
Manganese ..	0·332	0·336	0·41	0·16	3·12
Carbon .....	2·46	2·4	2·48	1·56	1·416
Silicium .....	0·28	1·82	1·42	1·32	0·52
Aluminium ..	0·38	0·48	0·26	1·37	0·599
Magnesium ..	..	..	..	0·79	..

This shews an average mean of 95½ per cent of iron. Hot-blast iron is thus obviously purer than cold-blast iron. The manufacture of the iron from the hot blast was not so tough as from the cold blast; but he did not know what they meant, as the two descriptions of iron took the same force to break them. The best steel produced at Glasgow, was made by Mr. Tennent, and found to be constituted as follows:—iron, 99·88; manganese, 0·190; carbon, 0·388. They never could get the exact 100 parts by analysis, and wherever they found them they might be certain it was an analysis made on paper. He considered that the goodness of the steel was owing to the absence of foreign substances. If they used the same quantities of coal with a hot blast as with a cold blast, they would not get iron at all; they must only use half the quantity of coal to the hot blast. Professor Thomson then exhibited specimens of iron No. 1, smelted by the hot and cold blast, from the same ore. The force required to break them was the same, being 2040 lbs., the iron being 9·8 thick. He also exhibited a chain forged of malleable round iron, ½th thick, which had stood the test of 22 tons 7 cwt. or more than twelve tons above the Liverpool chain cable test. This iron had been forged from hot-blast iron.

A member asked whether half of the coal was saved by using the hot blast. Dr. Thomson said that two-thirds were saved. Mr. Guest asked whether any phosphorus had been found in the iron analysed by Dr. Thomson. Dr. Thomson said it was carefully looked for, but not found. Mr. Guest wished to know whether the wrought iron had been manufactured. Dr. Thomson said it was not, but prepared in the usual way. Mr. Tennent said that one bar was made by the single process, and the other by the double process. Mr. Guest said, that the specimens being iron of different qualities, it was rather deceiving them by comparing them together. Mr. Tennent said that the specimens were both hot-blast irons. Mr. Guest inquired whether the iron of which those specimens was prepared was refined. Mr. Tennent said it had merely been through the puddling furnace. Mr. Mushett inquired how Dr. Thomson accounted for the low specific gravity of the Muirkirk iron. Dr. Thomson replied that he did not account for it at all; he had only stated the fact. Mr. Mushett had no doubt that the quantity of carbon introduced into the crucible made iron rich. It was seen that the best iron contained four per cent of carbon. Mr. Guest wished to call the attention of Dr. Thomson to the hot short and cold short Staffordshire iron. When cold it was very tough, but would not bend when hot. Dr. Thomson begged to remind Mr. Guest that it was Mr. Tennent who had analysed the malleable iron, and not himself. Mr. Tennent had tried the iron produced, both hot and cold, and it was perfectly tough at all temperatures. Mr. Guest inquired whether he had tried it at a blood-red heat. Mr. Tennent said, that, as it was tried in every possible way, it would be singular if it had not been tried at that temperature. Mr. Faraday inquired whether the tests were made at different times with the same specimens, or different specimens of iron from the same mines used. Mr. Tennent replied, with different spe-

cimens. Mr. Guest wished to know whether any experiments had been made upon the loss in converting the hot-blast pig iron into malleable. A general impression prevailed that a much larger portion of hot-blast iron was lost in converting it into bars than of cold-blast pig iron: was any attention paid to this circumstance so as to ascertain the fact? Mr. Tennent said that no attention had been paid to the loss of weight; all that they had endeavoured to ascertain was the strength of the iron. Dr. Clarke spoke warmly against the cold blast, which led to some debate. Mr. Guest was in the habit of smelting 300 tons a-week of hot-blast iron; he had nine furnaces at work with cold blasts; and, from his experience, had found that a much larger portion of hot-blast iron is lost in converting it into malleable iron than of the cold blast. The impression on his mind was, that the character of the iron was not so good. He thought that the increased temperature of the first mode gave more silver and aluminium, which was prejudicial to the iron. Dr. Thomson said, that in Scotland all the iron was made from the ore, but in England it was the custom, besides the ore, to add a quantity of cinders. It was not fair to compare iron made with a mixture of iron and cinders with pure ore. Mr. Guest stated, that the two sorts of iron compared were similar in every respect. The hot-blast iron was made under the circumstances out of ore. It was well known that in converting pig iron into bar iron, a great quantity of oxide of iron was produced, and, if the progress were carried on long enough, all the iron would be converted into oxide of iron. If they made iron from cinders, a larger portion of the iron oxidated in the furnace than of the common iron. He wished to know how that arose? Mr. Mushett said, that specimens had been exhibited at the adjoining Section made from hot and cold; both of which had been smelted on a larger scale than in their experiments, and there could be no doubt that hot-blast iron made as good iron as cold-blast iron. If the iron be put through the refinery, there would be a greater loss, but not if boiled. The loss in puddling runs 2½ cwt. to the ton. Professor Johnson said, that in the report read by Dr. Thomson, something had been established. From a comparison of the tables it would be seen that the quantity of iron in the case of hot blasts runs five per cent more than the cold blasts. Then another extraordinary fact was established, that in no case was there a trace of phosphoric acid. This was the more extraordinary, as in certain districts, more particularly at Newcastle, iron ores contain a great quantity of it; and the fact was likewise established,—there were two bars prepared in precisely the same way, one of the cold and the other hot, 9·8 thick; and both of them had broken with 2040 lbs. They had broken with precisely the same weight. Therefore it appeared that iron might be prepared from the same ores of precisely the same strength. There was one other point of great interest, if the white or black iron be analysed, you get the same quantities of carbon. Mr. Faraday said the time for cooling iron made no difference in its chemical properties. The white and black iron, although differing in toughness, were not different in chemical analysis. Mr. Guest had tried the experiment some time ago. He had cooled iron quickly, and produced white iron, and cemented it afterwards, and the Jersey iron was afterwards produced of as good quality as possible. Professor Johnson inquired whether it was not proved that white iron did not make good malleable iron. Mr. Guest said,

that that iron which shewed a few gray specks of carbon, but not too much, made the best malleable iron. He suggested to Dr. Thomson, that if he should continue his inquiries, it was very important that he should analyse the oxides produced from either of these processes. He should be very happy to furnish him with bars, both of hot and cold, as well as with the oxides of each. Dr. Thomson said, that what Mr. Guest called oxide was a combination of oxide and silicium. There were three or four different cinders, all of different compositions. Notwithstanding that Professor Johnson had said that the mechanical department of smelting was superior to the chemical, he knew that if phosphorus was put into iron it deteriorates it. The reason why the Swedish iron was better than ours, was because it was purer. We could not expect iron equal to the Swedish from our ore, seeing that it contained so much impurity. The iron about Newcastle, to which Professor Johnson had alluded, was an exception to the general rule; as the iron ore of England did not contain much phosphorus. Mr. Faraday, in conclusion, said it was very evident that hot-blast iron was cheaper for some purposes than the cold blast. He should, therefore, propose a vote of thanks to Dr. Thomson, for the care he had taken in preparing his report. Any one aware of the great extent of knowledge and care required to enable Dr. Thomson and Mr. Tennent to come before this meeting, would fully appreciate the worth of the report.

Dr. Traill then read a paper 'Upon a New Compound of Antimony as a Pigment,' which he had discovered last winter, when adding a solution of ferropussiate of potash to muriate antimony, by which he had produced very beautiful blue prussiate, somewhat resembling ultramarine.

Dr. Arnott read a paper 'On a New Safety Lamp for Mines.' His idea was to supply lamps at fixed stations in the mines, with air from the surface, by means of cheap wooden pitched pipes, into which the air should be injected by a steam-engine. Hose might be attached to these pipes where it might be requisite to move the light.

Mr. Pearsall, of Hull, read a paper 'Upon the Action of Rain Water upon Lead.' He instanced a number of cases in which persons had been poisoned by lead contained in water, and gave as his opinion, that the water contained lead in solution as well as in precipitation.

Professor Davy introduced a new gaseous carbo-hydrogen, which he had prepared by repeatedly passing the electric spark through bicarburetted hydrogen. He was pursuing further experiments, which he would lay before the Association next year. It appeared that the gas was deprived of one atom of carbon by the electric current, which formed a black crust on the endiometer.

Professor Johnstone likewise laid before the meeting a paper 'Upon the Composition and Properties of a description of Hatcheline,' a substance composed of carbon and hydrogen found in the coal measure.

Professor Miller read a paper 'On the Expansions of Crystals in different directions,' by which it appeared that if sulphate of lime, and various other crystalline substances were heated, they would expand in different proportions in different directions.

#### SECTION C.

Mr. Hutton read a letter from Dr. Jeffreys, of Liverpool, describing a quantity of fossil bones found on the estate of Mr. Lloyd, on the banks of the river Mersey, three miles

from St. Asaph. It contained not only specimens of the smaller animals, such as rats, mice, and cats, but also many of the larger animals, amongst which were hyenas, tigers, and wolves. Dr. Jeffreys also stated, that the collection would be open for public inspection.

Sir David Brewster's letter on the diamond was read (See *Literary Gazette*, No. 1078).

Mr. J. P. Heywood next read an elaborate paper 'On the Great Coal Fields of South Lancashire.' He stated that the coal fields of South Lancashire covered a space of nearly 400 square miles, and that the largest bed was 250 square miles—that the Earl of Balcarras gave employment to 800 persons in the collieries about Vigan, and that Lord Francis Egerton gave employment to 1700 persons in the mines near Worsley. The coal used in Manchester in 1836, was valued at 500,000*l*. Mr. H. proceeded to refer to a geological map of South Lancashire, with the coal fields and their positions, as respects the great sand-stone formation, by which, in some places, they are intersected. He stated that he was not a coal-owner himself, but in the construction of his map had received every assistance from the proprietors. Every geologist present must be aware of the immense amount of labour taken to construct that map, and that no individual, were the term of his life quadrupled, could hope singly to accomplish it. He, therefore, called on them to take notice of all peculiarities that might exist in their immediate neighbourhoods, and to note their observations. It would be seen, that in the neighbourhood of Liverpool, the map had not so many marks of labour bestowed on it as appeared in other places; in fact, some portions of it were colourless. This arose from, he was sorry to say, the want of observers in this particular district. There was, therefore, a wide field yet open, and he should be most happy to add the results of any future observations to complete his map.

Professor Sedgwick, in moving for the thanks of the meeting to Mr. Heywood, remarked that proprietors of land could not be too thankful to such men as Mr. Heywood; for it was a proverbial fact, that thousands of pounds had been spent in mining speculations, which would never have been entered into had a geological map been in existence, similar to the one just exhibited. He would also say, that a man like Mr. Heywood, who was not an owner nor a dweller in one particular district, was best fitted to construct such maps, and to give the best information on the subject.

Mr. Williamson next read a long and extremely interesting paper 'On Sections of the same District.' He produced drawings of fossils discovered in a peculiar limestone; and, also, one of a fish he styled (from the nature of the scales) a salmon, which he had found in the coal fields. The circumstance of the fish being a salmon was refuted by Sir Philip Egerton, who stated that he had himself found a similar fish, which belonged to a separate family, the genus salmon never being found in coal strata.

Mr. Peace read a report on the dislocations and other phenomena of the coal-fields of Wigan; and Mr. Logan on the coal-beds of South Wales.

Mr. Smith, of Jordan Hill, near Glasgow, read an interesting paper 'On the Changes of the Levels of Sea and Land, bearing on the Statements made by Mr. Strickland, on Monday.' His observations had been carried on throughout the coasts of Ireland and Scotland; and the shells (which he liberally distributed among the members) were found, in many instances, forty feet above the level of the sea. The

specimens we examined were truly said to be "amongst the most interesting, because, being common, they become characteristic of the marine beds in which they occur; the Tellina resembles the Tenuis, but has a brown epidermis, of which the remains are readily observable. The Natica is supposed by Sowerby to be the *Natica glaucinoides* of the English crag; the Fusus was also supposed by him to be the *F. lamellorus* of the Straits of Magellan, but this is doubtful; the Turbo resembles the *Nerita littoralis*, but has a pointed spine. In these beds, which Mr. Lyall would call newer pliocene, Mr. Smith has found 166 species of shells; of these, fourteen differ from any which are known."

Captain Portlock read a paper 'On the Analogy between the Irish and English Red Sandstone, by the circumstance that shells, &c. of a similar cast had been found in each.'

#### SECTION E.

The proceedings of this Section, though of interest to medical science, were not of interest to general readers; and if they were so, we do not think them adapted to the columns of a journal with readers of both sexes and of tender age. What follows is *quant. suff*.

Mr. James Carson read 'A Report of a provisional Committee of the Medical Section appointed to investigate the Compositions of the various Animal Secretions, and the Organs that secrete them.' Another similar by Dr. Rees.

Dr. Holland then read 'An Inquiry into the Influence of the Mind on the Heart, and other Organs, in Health and Disease.'

Sir James Murray exhibited an ingenious contrivance, something like a slipper-bath, which had an air-pump for exhausting the air applied to it. The patient was placed in it, and it was then made air-tight, leaving him a breathing communication with the external atmosphere. The air was then exhausted from the interior, and atmospheric pressure removed from the pressure of the body. About a pound of atmosphere being exhausted, took off a ton of atmospheric pressure. The consequence was, where the body was before cold and collapsed, the vessels were immediately filled up and rendered turgid, while it did not at all interfere with the process of respiration. There were several other ingenious contrivances and applications of the same invention.

Some discussion followed this, in the course of which Dr. Macartney named a very valuable discovery to anatomists, viz. saturating the hands, and other parts exposed to the noxious influence of dissection, with a solution of alum, which completely prevented any ill effects.

Dr. Carlisle offered some remarks on two remarkable malformations of the cerebellum of the human subject.

#### SECTION F.

Mr. Henry Ashworth, of Molton, read a paper 'On the Statistical Results of the late Strike at Preston.' From this report it appeared, that in Preston and the vicinity there are forty-two cotton-mills, giving employment to 8500 hands, and requiring 1200 horse-power to work them. The estimated value of the buildings and machinery is 550,000*l*; the amount of capital required to work them, 250,000*l*. The beginning of the year 1836 was marked by great activity in the cotton trade; the master spinners were supposed to be making considerable profits, whilst the operative spinners, with some appearance of truth, supposed their wages were not commensurate with those profits. In October 1836, the average net earnings of the cotton-spinners of Preston, after paying piecers, &c., were 22*s*. 6*d*. per week, whilst at Bolton

and some of the neighbouring places spinners were receiving, on an average, 25s. per week. There was, however, this difference—the Preston masters had adopted a uniform rate of wages, varying little, if any, with the fluctuating state of trade; whilst at Bolton and other places, wages were raised when trade was favourable, and lowered in times of depression—a plan which, in consequence of the want of economy and foresight on the part of the operatives, only exposed them to greater temptations, to excess in times of prosperity, whilst it occasioned the greatest misery in times of depression. It also appeared that house-rent and provisions were considerably cheaper in Preston than in Bolton. There existed a spinners' trade union in Preston, which, at that time, consisted of from 150 to 200 persons, or considerably less than half of the number of spinners employed. Meetings of this body, attended by delegates from other towns, were held. On the 13th of October a council was formed, and communications took place with the masters, who offered an advance of ten per cent on the rate of wages, stipulating that every man employed should sign an agreement not to belong to any trades' union or combination whatever. These terms were refused by the council of spinners; and, on the 7th of November, the men struck work, all the factories were closed, and 8500 individuals were thrown wholly out of employment. Of these 660 were spinners, having pieces and others under them, 1320 pieces, 8100 weavers, &c., and 420 overlookers, porters, &c. Of these it was stated, that the 660 spinners, or the greater portion of them, were the only persons with whom the turn-out was a voluntary act. The report then detailed the straits and misery to which the working classes were reduced; until, at length, the funds of the union were exhausted, and, on the 5th of February, the men came into the terms originally proposed by the masters, and work was resumed at all the mills, 200 of the spinners who had been the most active leaders in the turn-out having their places supplied partly by self-acting spinning mules, then introduced into Preston for the first time, and partly by men procured from other places. Amongst the consequences of the turn-out were mentioned the following facts:—150 persons were taken before the magistrates, charged with drunkenness and disorderly conduct; 75 were committed for assaults and intimidation of workmen; 20 young females became prostitutes; three persons died of starvation; 5000 must have suffered extreme privations; the men sold or pawned the greater part of their clothing and household furniture; most of them were in arrears for rent; and great losses were sustained by shopkeepers and others. The total losses were thus estimated:—

600 spinners' wages for 13 weeks, at 25s. 6d. ....	£9,850
1320 pieces, ditto ditto at 5s. 6d. ....	4,719
8500 weavers, &c. ditto ditto at 5s. 10d. ....	38,140
Estimated loss of hand-loom weavers .....	9,500
Ditto of clerks, warehouse-keepers, &c. ....	8,000
<b>Deduct —</b> .....	<b>£70,130</b>
Estimated amount earned between the 9th of January, when work was partially resumed, and the 5th of February .....	<b>£3013</b>
Relief given by masters .....	1000
Private charity .....	2800
Allowance to spinners and pieces from the Trades' Union .....	4390
<b>—</b> .....	<b>12,793</b>
<b>Nett loss to operative spinners .....</b>	<b>57,290</b>
Three months' interest on 800,000s. sunk in machinery, &c. lying useless, loss to the town at large, &c. ....	45,000
Shopkeepers' loss of business and bad debts .....	4,986
<b>Total loss .....</b>	<b>£107,306</b>

Mr. Wyse, in moving the thanks of the Section to Mr. Ashworth, said that these inquiries were of great interest and importance, as tending to enlighten the minds of the operatives themselves, who almost universally entered into these turn-outs at the instigation of a few designing individuals; whilst they not only failed in obtaining the objects they proposed to themselves, but at the end of the struggle were in a worse situation than they were before, besides the misery and privation which they brought upon themselves and their families in the interim.

In the course of an interesting discussion which ensued, several gentlemen expressed their regret that a better understanding did not prevail between the masters and the men; and certain societies, established in some of the manufacturing districts of France for the consideration of matters relating to trade—consisting of six of the masters, six of the men, the chairman being a master—were mentioned as worthy of imitation in this country. Several instances were mentioned in which extensive mischief had been done, both to places and individuals, by these turn-outs, especially the removal of Mr. Heathcote's bobbin-net manufactory into Devonshire; whereby 2000 hands were thrown out of employment in the district from which he removed. Mr. Merritt mentioned the turn-out at Liverpool, four years ago, of all the workmen connected with the building trades, estimated to be 16,000 in number. The objects they proposed to themselves were principally three: first, to put an end to building by contract; secondly, to obtain the same wages for a smaller quantity of work; and thirdly, to include all workmen in the union; in all which objects they signally and completely failed. Several other striking facts were mentioned, all tending to show that in every struggle of this kind the men have always been, and must always be, ultimately the losers.

**Cellars in Liverpool.**—Lord Sandon stated that, as the document laid before the Section on the previous day relative to the cellars and courts of Liverpool was much disputed, their worthy chief constable, Mr. Whitty, had been consulted on the subject, who promised to make such inquiry thereupon as would set the matter at rest. He had done so, and with the permission of the Section the letter from Mr. Whitty would be read. The following is the statement alluded to:—"In the parish, or old borough, there were 6506 cellars, 1984 courts, and 25,732 dwelling-houses, for a population of 190,000; in the outskirts, 6364 houses, 987 cellars, and 307 courts, population 40,000. Few of the courts possess any outlets, and of the cellars the greater proportion are dark, damp, and without ventilation. The average was four persons to each cellar, giving a total of 30,000 occupants of cellars, out of a population of 230,000, and it was estimated that two-thirds of the population belong to the working classes." By Mr. Whitty's letter, it appeared that the number of cellars were 7662, and the inmates thereof 41,338. That it was not from poverty that a great number of them were thus occupied, but for convenience of carrying on little trades and keeping mangles; together with the wish that some had of not paying rent, knowing that cellars had a separate entrance, and were almost independent of the landlord, who, when the tenants did not pay, had much difficulty in removing them in consequence.

His lordship hoped that this circumstance would be another stimulant towards the formation of a Statistical Society in Liverpool, and

spoke highly of the comfortable state in which he had seen some cellars in Liverpool.

Mr. George Webb Hall read a paper, 'On the Improvements effected in Agriculture during the last Century.' These he traced, principally, to the introduction of the potato and turnips, and enumerated the different modes of culture, draining, feeding, breeding, &c. &c.; describing the effects produced, giving due merit to individuals generally, for the good which they had effected. He regretted that, whilst so much had been effected for the improvement of agriculture, so little had been done for the improvement of agricultural labourers. Amongst the measures which he strongly recommended, was the cottage allotment system, to the excellence of which several gentlemen bore strong testimony, and mentioned many striking facts, illustrative of its advantages, not only in improving the condition and character of the labourers, but in improving the value of the land.

A long and very animated discussion took place on this subject, and several noblemen and gentlemen advanced their opinions in favour of spade husbandry, amongst whom were Lord Sandon, Lord Nugent, Mr. Wyse, and a number of extensive landowners throughout the united kingdom. The state of the agricultural labourers was brought under consideration, and a number of instances were adduced to show that spade husbandry would remove every difficulty and trouble under which they laboured. Not only so, but that the land would be greatly improved, and that, as was said in conclusion, by introducing spade husbandry throughout the kingdom, agriculture would become what horticulture now was—a branch of science; and that mechanics would become hand work, while agriculture would be found to be head work. That the spade would supersede poor laws in the agricultural districts, and much improve the condition of agricultural labourers throughout the united kingdom; prevent their removal and breaking up of their little establishments; and that giving them little gardens of about a quarter of an acre, a large body of evidence could be brought to prove, would also be highly beneficial to them, and profitable to the landowner. That the piece of land on which the report was drawn was so very successful, that the gentlemen to whom it belonged had taken 100 acres, which was now undergoing cultivation by the spade, with every prospect of being as successful and as profitable in proportion as the smaller quantity upon which the report was founded.

Mr. Hall contended there were a great many vagaries attached to the notion of spade husbandry, and that it was a fallacy to think it would answer throughout the country. In some parts land might be found which spade husbandry would improve, but it was not generally the case; besides, that which Dr. Yelowly had reported on was of a peculiar nature, and any one knowing any thing of the question must know such land was very different in quality to the generality, and it was no criterion whatever to shew that spade husbandry would be at all beneficial either to the soil, landlord, or labourer. A small piece of land being profitable under such a system, was no guidance for a large establishment.

Several gentlemen remarked on the benefit of allotting small portions of land to labourers, and instanced how much their condition was improved thereby, and their morale and health promoted.

Lord Sandon said, he had 330 such allotments, which he let out at about 2s. to 3s. per

acre, of about a quarter of an acre each, and which returned to the occupier about 3*l*. per quarter.

Lord Nugent made a similar statement, and bore testimony to the good it had done in the neighbourhood in which he resided.

Mr Fripp then read his paper 'On the state of the Working Classes in one of the Parishes of Bristol,' in which their condition was described to be beyond belief miserable.

Dr. Yellowly read a paper 'On Spade Husbandry in Norfolk.' A farm of 317 acres, belonging to Mr. Mitobell, was cultivated with 8 horses and 20 men, under a system of spade husbandry, which had required 12 horses and 20 men with the plough, and the general results were, better wages to the workmen, and an increase of one-third in the produce of the farm. Mr. Mitchell attached a garden, of a quarter of an acre, to each of the men, from which they derived a profit of 3*l*. 3*s*. a year. Sir Edward Kerrison, in Suffolk, had made 200 such allotments, which were sought after with avidity. The rents were paid with great regularity, and the improvement in the condition and character of the cotters was very manifest.

#### SECTION G.

Mr. Lang gave an interesting history on certain improvements in ship-building, adapted to the merchant service. They originated many years ago, when, in Plymouth dock-yard, he saw the number of vessels sent in from blockading the enemy, for repairs, in consequence of the insufficient structure of their keels. He referred to a number of well-known cases, especially the *Pique* and the *Lightning* steamer, to shew that his plan saved them from destruction, when other vessels perished, and that a vessel could lose her keel and continue months on duty. His plan was now adopted by her majesty's navy and three foreign powers, and was rapidly extending. Mr. Lang described his plan in technical terms, with the assistance of drawings and models, very fully. He said it did not increase the cost of ships of war, but did a little that of merchant ships. It was like giving a ship "three back bones, instead of one." Mr. L. fills up the floor perfectly solid, puts in a keelson and a keel in the usual way, and bolting them well together and caulking all up. On each side of this keel he fixes another broad and flat one, and over these another, all secured in a peculiar way, by dovetailing, but so as one may come off without bringing off the other, and the whole without damaging the floor; over all he puts a false keel. In the model he shewed, the depth from the inside of the floor to the bottom of the false keel is about twice the depth of the keelson, and the breadth of the three keels under the floor a little more than the depth from the top of the keelson to the bottom of the false keel. He caulked with Borrodalle's felt, observing that, when the seam is caulked the usual way outside and inside, the oakum does not reach the centre, but leaves a hollow, where damp lodges, to the destruction of the timbers. He also explained technically the mode of securing the gripe and the fore foot, so as to leave the stem independent of the keels, and also to secure the stern-post, which Mr. L. observed, in the ordinary build of merchantmen, was very indifferently secured.

*Strength of Iron, Hot and Cold Blast.*—Mr. Fairbairn read a paper, in continuation of that of the preceding day, to ascertain the strength of iron for resistance, and the best form for resistance. With reference to the latter, they found, by loading bars of different sections with weights, that Emerson's rule, that the strength of bars

and beams with rectangular sections was as the breadth multiplied by the square of the depth, did not always hold good. The report then went on into a variety of important experiments on the powers of different kinds and forms of iron, in supporting weights when used as pillars. This power of iron was generally as its sectional area when the height was the same, but different kinds of iron varied considerably. For instance, on the square inch, pillars of equal height of Carron iron (cold) supported 13,882*lbs*.; of Devon (hot), 20,907*lbs*.; of Buffery (hot), 14,436*lbs*.; Buffery (cold), 17,466*lbs*.; Cortallian (hot), 16,279*lbs*.; Cortallian (cold), 17,374*lbs*.

*Resistance on Railways.*—Dr. Lardner addressed the section on this subject. He detailed the nature of the resistance to tractive force on railroads, and went over the well-known principles expounded by Vince, Colomb, and other writers on physics. He pointed out the difficulties of obtaining the truth by direct experiment, either by a dynamometer or by measuring velocities on inclined planes. He amended some algebraic formulæ, which he contended were erroneous, the gyration of the wheels not being taken among the elements of the calculation. A very long and unproductive discussion ensued.

Mr. Roberts, of Manchester, explained a contrivance which he had formerly made for the purpose of ascertaining the amount of friction. He had found that a trifling diminution of friction took place when the speed was much increased. Mr. Roberts mentioned a curious circumstance which occurred to him once on the Liverpool and Manchester railroad. It was blowing a hurricane, and the wind was almost parallel with the railroad, in the direction of Manchester. He was directed to take an engine and follow a train which it was feared might not be able to contend with the violent wind that was blowing. He did so, and on his return he found that the wind, which was blowing about eighty miles an hour, was sufficient to carry them along without the smallest assistance from steam. In this manner they went at such a speed as completely to neutralise the effect of the hurricane. Sometimes they had a puff of air in their faces, and sometimes they felt a slight effect from the wind at their back, but generally the effect was that of a calm still air. He would mention another matter illustrative of the effect of the air. At one time of his life he used to amuse himself by making spinning-tops. He had made a top which spun forty-two minutes. A friend requested him to make a top for him, and with this top he took particular pains, and to make it look more handsome he put on it a thin coat of the finest lacquer. He found that it would not spin longer than seventeen minutes. He removed the lacquer, and the top then spun thirty-seven minutes. From this he was of opinion that lacquer should not be put on clock pendulums.

Professor Robinson observed, that without any practical knowledge of the subject, he could not consent to leaving the air out of the calculation. Astronomers had to contend with every natural power, and among the rest, the pendulums of their clocks had to contend with two effects of the atmospheric air. The first was the resistance of the air, which was of little importance; the other was the "sticking" of the air to the pendulum in passing through it, which sometimes amounted to ten seconds a-day. If such were the effect of the adhesion of the air on a motion so minute and slow as that of a pendulum, what must it be, to say

nothing of the direct resistance, on long trains forced through at high velocities? He merely threw out the hint for practical men.

Mr. Leethead's Safety Lamp was explained. This lamp is a brass cylinder, with a glazed aperture about two inches diameter before the lamp. To dispense with the wire gauze, it is furnished with a ball about four inches in diameter, fitted with a stop-cock. The ball is to be filled with condensed oxygen gas to feed the lamp. There is no air admitted below; and, as the inventor observed, it can only fire an explosive gas at the top.

*Telegraphs.*—Dr. Clauuny produced a model of a new telegraph, which he explained. It is on the principle of a dial and index, with a corresponding arm above.

Dr. Lardner hoped that they would soon know the result of Professor Wheatstone's invention of electric telegraph. He fully expected that it would establish communications independent of light, place, and almost of time.

Lieut. Watson, of the Liverpool telegraph office, read part of a paper 'On the Advantages of Night and Day Telegraphic Communications connected with Railways, and for general purposes.' Amongst the great attainments accomplished by science in promoting a rapidity of transit by steam, the still more rapid means of conveying intelligence by symbols or telegraphs has been comparatively lost sight of; but, latterly, the importance of attaching a perfect system of night and day telegraphs to the purpose of railway travelling, has engaged serious attention; and the question is rapidly gaining ground, that some such project is indispensable, in order to insure punctuality, prevent and remedy accidents, relieve anxiety, and promote public confidence in railway travelling. The means of securing these advantages have been ascertained and acted upon, so as to leave no doubt upon the mind of the projector of the full efficiency of his plans, but he is precluded from entering into the minutiae of the system, and of the successful night experiments which have been made, both by the space it would occupy, and by the intention of making his invention the subject of patent right. Assuming that an efficient line of telegraph communication by night and day be formed upon the line of railway from London to Liverpool and Manchester, such as has been recently proposed by the writer from an actual survey made, the effect of such an establishment would be,—that every yard of the rails (with little exception, besides tunnels) would be in view from one station or another, the average distance of each being less than five miles; that, consequently, no train upon the line could at any time be out of sight; that, by night or day, each train would be watched throughout its whole progress; that a complete line of intercourse would be formed from one extremity to the other, embracing every locomotive or passenger station, every junction branch or road, not only affording a means of communication throughout from station to station, but between any station and any train upon the rails, and *vice versa*; being, in fact, a power occupying the whole extent of the line, capable of affording an almost simultaneous knowledge at one point of what was doing at any other. For instance, a superintendent, placed at the central or any other station, should have such information laid before him as would enable him at any hour, by night or day, to point out, upon a plan, the position of every train travelling upon the rails, the rate of speed of each, the amount of spare power, proximity to each other, if 'all's well,' or if labouring under any defect or diffi-

culty; and with this knowledge he could issue his orders and directions as circumstances required, and be enabled to place responsibility where it ought to rest, and detect, at once, the misconduct or carelessness of any person connected with the travelling department. Should an engine become defective and proceed with difficulty, on communication made to the nearest depot, another engine would be sent at once to bring in the train; and this defect must continue to occur from a variety of contingencies beyond control. In the event of a break down, or an engine getting off the rails, a communication would be immediately made, by the guard or conductor of the train, to the nearest locomotive station; the cause and extent of the accident being known, the required assistance would be at once supplied, and all speculative anxiety avoided; but such an event, without the means of communicating, would be attended with the inconvenience of delay, until assistance may happen to arrive, and which, when it arrives, is, perhaps, not that required. In the mean time the most intense anxiety prevails with those who have friends in the expected train; and what may eventually turn out to be a mere casual delay, is magnified by fear into a dreadful accident, with loss of life or limb. Witness a late accident upon a railway when the last train broke down, and the passengers were detained upon the rails the whole night. Where the travelling of one line depends in a certain degree upon that of another, it is most essential to insure punctuality; this point may be strikingly exemplified in the Great Junction, at Birmingham. A train from either end is expected to arrive there at eleven o'clock, and another forward is advertised at half-past eleven o'clock — this time arrives, but the expected train not — in the total absence of all knowledge of the cause or probable extent of the delay, whether the train may arrive in five minutes, or one, or two hours, the forward train starts without reference to its arrival, taking with it the positive information that something has occurred to delay the train; consequently, persons at the terminus expecting their friends, though they witness the arrival of a train that ought to bring them, have but the disappointment to learn that, from some cause or other, which no one can speak to beyond conjecture, the train to Birmingham was delayed. The passengers by the delayed train, whenever it arrives, naturally expect to proceed forthwith; consequently, an extra train must be furnished, or they must wait the departure of the succeeding one, which may be an hour or more hence. On the other hand, the telegraph would immediately, upon the occurrence of the accident, announce its extent, and measures would be taken accordingly, and thus all unnecessary anxiety avoided. Another very important point is, that an accident may cause an accumulation of trains upon the same spot, none of which can pass to the opposite line, not knowing what may be approaching in that direction; but by means of the telegraph, with the knowledge of the position of all the trains upon the rails, intimation might be afforded to those trains capable of proceeding, as to what spot they may safely cross from one line to the other without the risk of collision, which attempt cannot be even contemplated without the means of knowing the situation of approaching trains. It is manifest that to provide against, and remedy these casualties, a perfect intercourse must be effected, not only from trains to stations, but from stations to trains when in the act of motion. For instance, in a dark night, there is an impediment

in the way of which it is necessary to warn approaching trains, travelling at the rate of twenty or thirty miles an hour. Nothing but a visual telegraph can effect this object. The theory of electro-magnetism has been proposed to be used for the purpose of making these communications. Little doubt can be entertained that, if brought to bear, this powerful agent would prove an instantaneous and effectual means of communicating from station to station, and may be a most valuable adjunct to a visual telegraph, which, for railroad purposes, it cannot supersede the necessity of, unless capable of effecting communications to and fro between stations and trains when the latter are in motion. Doubtless, the electro-magnetism would possess a great advantage over the visual telegraph for general purposes of communication in foggy weather. On the subject of climate generally, as connected with telegraphic communications by day, the official returns of Paris and Liverpool in November and December 1836, the worst months in the year, exhibit, in the case of the French telegraph, only one-seventh of the communications received on the day of their date, and in that of Liverpool, only one-ninth defective by influence of weather. The French lines are certainly of greater length than ours; but the average and extreme distance of some of our stations, I believe, greatly exceed theirs, and in most cases more than doubly exceed those proposed upon the railway. With regard to speed of communication, I have, with the present inefficient telegraph, under the most favourable circumstance, passed a distinct question from Liverpool to Holyhead, and received an answer within twenty seconds, a distance of 144 miles. This, with only one man at each station, emboldens me to say, that I have no doubt, with the additional manual power I should have in my project from Liverpool to London, that I could pass a distinct question, and receive an answer in Liverpool, within a minute and a half, allowing the distance to be 400 miles. The night apparatus I propose to use equals in power the present admirably telegraph; but the day semaphore is capable of making any amount in numbers at one simultaneous movement. Communications may be effected through the line with secrecy so impenetrable, that no person connected with the telegraph, or who may actually transmit the signals, can by any possibility become acquainted with their purport. For commercial and government purposes, also, it will be found to be of great utility, and, when considered in its three-fold capacity, as promoting convenience, insuring punctuality in business, and much economy in the distribution of steam power, it will, no doubt, become valuable both to the public at large, as well as to all who are interested in railroad traffic. As a patent is about to be taken out for this invention, it was not further illustrated.

Mr. Curtis sent a model of an inflexible iron bridge.

Among the practically useful papers for daily convenience, was a paper read by Mr. J. J. Hawkins 'On Measuring the Eyes for suiting them with Spectacles.'

Mr. H. said, that he had measured the width of the eyes of many persons, and found in some a pair of eyes three inches and a quarter apart, from centre to centre, and in others only two inches and an eighth: now, it must be obvious that, if a pair of spectacle-frames, made of the proper width for the narrow eyes, were applied to the wide eyes, the sides of the frame would completely obstruct vision: yet it was a la-

mentable fact, that multitudes of spectacle vendors never paid any attention to the width of the eyes of their customers; and hence numerous persons had their sight ruined by looking through the sides of their glasses, instead of through their middles, where alone vision is the most perfect. More than ten years ago, Mr. H. called the attention of opticians to this subject, in a paper, published in the "Repository of Patents," for December, and in the Supplement, for 1826; to which, to save the time of the Section, he referred the members for much useful information on the eyes. Mr. H. exhibited to the Section an instrument for measuring the width of the eyes, consisting of two arms revolving on a common centre; one of the arms carrying an index, the other a plate, graduated to represent the actual distance of two holes, one-thirtieth of an inch diameter, near the extremities of the two arms; one hole in each arm. By moving the arms until both eyes can see the same object through the two holes at the same time, and referring to the index, the exact width of the eyes would be ascertained, and, consequently, the proper width of the required spectacle-frame obtained. For measuring the focus of the eyes, and in substitution of the plans recommended in his paper alluded to, Mr. H. produced a card, on which were drawn twenty-four fine, equidistant, radial lines, corresponding with the angular positions of the hour hand of a clock at every half hour; and he recommended that the person should cover one eye, without pressing on it, and look with the other eye on the card, placed against an illuminated wall, holding the eye so near that all the lines shall appear indistinct; he should then slowly retire from the card until one of the lines appears well defined, measure the distance of the card from the eye, and note it down as the shortest focus of that eye; retiring still further, if, at any point, all the lines appear distinct, note the shortest distance of that occurrence as the best focus for long-sighted persons, and the longest distance for short-sighted persons; again retire until all the lines, except one, appear indistinct, then note that distance as the longest focus; repeat the operation with the other eye, and, if there be any distance where all the lines are clear, the nearest point where that happens in the long sight, and the furthest in the short sight, may be taken as the best focus; but if, as is frequently the case, there is no distance where all the lines appear clear; then the best focus will generally be an arithmetical mean between the longest and shortest distance. Mr. H. stated, that, with his right eye, through spectacles of twelve-inch focus, he could only see clearly at the distance of

16 inches, the line corresponding with.....	1 o'clock, or 7 o'clock.
At 30 .....	12, 13, 1 .. 6, 6½, 7
At 25 .....	12 .....
At 35 .....	3 .....

And, with his left eye —

At 12 inches, the line corresponding with.....	3 o'clock, or 9 o'clock.
At 17 .....	2, 2½, 3 .. 8, 8½, 9
At 24 .....	all the lines clear
At 34 .....	12, 3 .....
All the other lines being indistinct, generally double.	

Mr. H. added, that the examination of the real state of the eyes, by these or by equivalent means, ought to precede the attempt to select spectacles for them.

The proceedings of the General Committee we have already noticed.

At the Promenade in the Town-hall, on Tuesday, we heard there were 2800 persons: to-night there were not quite so many; but still, there was a very crowded assemblage.

## ZOOLOGICAL SOCIETY.

THE usual monthly meeting, on Thursday afternoon, did not take place, there not being a sufficient number of members present. The dromedaries, in the gardens at the Regent's Park, have presented the Society with a fine, lively, and likely to-do-well young one. This is the first instance of the kind, it is believed, in England.

## ORIGINAL POETRY.

## THE POET.

JOVE said, one day, he should like to know  
What would part the child of song from his  
lyre;

And he summoned his minions, and bade them go,  
With all their bribes and powers below,  
Nor return till they wrought his desire.

The agents departed, Jove's will must be done;  
They vow'd to perform the deed full soon:  
Vainly they search'd in the crowd and the sun,  
But at last they found a high soul'd one,  
Alone with his harp and the moon.

Fortune first tempted: she scatter'd her gold,  
And placed on his temples a gem-bright rim;  
But he scarcely glanced on the wealth as it rolled;  
He said the circlet was heavy and cold,  
And only a burden to him.

Venus came next, and she whisper'd rare things,  
And praised him for scorning the bauble and pelf;

She promised him Peris, in all but the wings;  
But he laughed, and told her, with those soft  
strings

He could win such creatures himself.

Oppression and Poverty tried their spell,  
Nigh sure he would quail at such stern behest;  
His pittance was scant, in a dark dank cell,  
Where the foam-spitting toad would not choose  
to dwell,

But he still hugg'd the harp to his breast.

They debated what effort the next should be,  
When Death strode forth with his ponderous  
dart;

He held it aloft—ye should know, cried he,  
This work can only be done by me,  
So, at once, my barb to his heart!

It struck; but the last faint flash of his eye  
Wasthrown on the lyreas it fell from his hand:  
The trophy was seized, and they sped to the sky,  
Where the Thunderer flamed in his throne on  
high,

And told how they did his command.

Jove heard, and he scowl'd with a gloomier  
frown— [unseen]

'Twas the cloud Pride lends to keep Sorrow  
He put by his sceptre and flung his bolt down,  
And snatched from the glory that haloed his  
crown,

The rays of most burning sheen.

He hasten'd to earth, by the minstrel he knelt,  
And fashion'd the beams round his brow in a  
wreath;

He ordain'd it immortal, to dazzle, to melt,  
And a portion of godhead since then has still  
dwelt

On the Poet that slumbers in death.

E. C.

## DRAMA.

Covent Garden opened on Saturday, with Shakespeare's play of *The Winter's Tale*, with the female portion of the characters "cast" in such a manner as bids defiance to rivalry of any kind, or at any place; but, before we notice the performances, we should state some of the im-

provements that have been made. The whole of the theatre has been *cleaned*, freshly painted, and decorated with great taste; lobbies have been formed round the boxes, thus separating them from the saloons, and doing away with a portion of the audience that was a disgrace, as well as an annoyance. The chandelier has been renovated, and glitters like a large cluster of diamonds, adding greatly to the effect of the roof, which has been thickly studded with stars, and which, with the chandelier, forms a beautiful *coup-d'œil*. A handsome new drop-scene adds greatly to the effect of the interior: but to proceed with the performances. After a well-played overture the curtain rose, and Mr. Macready came forward; if the plaudits he then received be a guarantee of future success, Mr. Macready must succeed. The house, which was full to the ceiling, rose to a man; and we never, to our knowledge, heard such a tumult of applause as welcomed Mr. Macready and the legitimate drama. He spoke a manly and promising address, and was again most cordially greeted at its conclusion. The whole of the company sang "God save the Queen," and the *The Winter's Tale* proceeded. We need hardly say that the *Leontes* of Macready was, both in conception and delineation, a master-piece; so we pass on. Diddead played *Polixenes* with great taste and judgment; Bartley was a merry *Autolycus*, Bennett, a good *Antigonus*, and Meadows, a capital *Clown*. The other male parts were fairly sustained, and do not require separate notice, with the exception of Mr. Anderson, who made his *début* before a London audience in the part of *Florizel*. This gentleman is a most valuable acquisition to the London boards: he has a good person and a very fine voice, and displayed much taste in his delineation of the short part allotted to him. We hope we shall see him in a more prominent character before long; he is the very form, and all that can be desired, for *Romeo*, *Orlando*, and that line of business; he gives great promise of future excellence, and will fill a place that has been too long vacant in his profession. But, to return to the female portion: Miss Faucit deservedly gained new laurels by her performance of *Hermione*, which was sweetly feminine and graceful. The *Paulina* of Miss Huddart, and the *Perdita* of Miss Taylor, were admirable; as were Mrs. W. Clifford's *Emilia*, Miss P. Horton's *Mopsa*, and Miss Vincent's *Dorcas*. The play was followed by *A Roland for an Oliver*, and the whole concluded by midnight.

On Wednesday, Messrs. Leffler and W. J. Hammond made their first appearances at this house in Bickerstaff's opera, *Love in a Village*, and were very warmly received. Sterling plays have drawn good houses since the opening of this theatre.

*Haymarket*.—Mr. Phelps proceeds, but not very happily, in leading parts; when he takes his proper station, he will be an ornament to the stage; as it is, comparisons are forced on us which are by no means advantageous to this gentleman.

An operetta called *Swiss Swains*, full of delightful ballads composed by Alexander Lee, was played on Thursday; our notice of it must be postponed till next week, only saying now that Mrs. Waylett's singing is quite a treat.

*Adelphi*.—Re-embellished, and the company numbering nearly all the old favourites, this pretty little theatre opened on Friday week with two novelties; the first, called *Rory O'More*, is from the pen of Mr. Lover, and is founded on his own novel of the same name; he has, however, made many alterations, and given a

series of highly dramatic incidents; the *dramatis personæ* being ably supported by the different actors to whom they were intrusted. Mr. Power played the hero with great spirit, and added, if that be possible, to his already high reputation by his capital acting of *Rory*; in which character, we venture to predict, he will be even more popular than he has been in any other. Yates was perfectly in his element as *De Welskein*, and murdered the Queen's English most famously. O. Smith had a suitable part in *Shan Dhu*, the rival of *Rory* for the affections of *Kathleen*, Mrs. Yates, who gave much sweetness to her short part. *Mary O'More*, *Rory's* sister, was played by Miss Agnes Taylor, a *débutante*. This young lady has a very sweet voice, and warbled a couple of Lover's charming lyrics in an excellent manner. When she becomes more accustomed to the stage, and overcomes that nervousness always attending the commencement of her profession, she will add another to the already numerous favourites at the Adelphi. The second piece, *The Pocket Book*, is one of those domestic dramas quite peculiar to this house, in which Mrs. Yates's touching acting is quite unrivalled. It was perfectly successful, and has been repeated nightly to overflowing audiences. Wilkinson has a part well suited to his style in this burletta, and is very happy in his delineation of it.

*Olympic*.—Madame Vestris commenced her campaign on the same evening, with Mr. Dance's comedy of the *Country Squire*, introducing Mr. Farren to an Olympic audience. We need not say he succeeded here, for he must succeed any where. Two new burlettas, for that is the name by which the amusing trifles produced at this theatre are known, were played on the same evening; the first, *The New Servant*, introduced Mr. and Mrs. Keeley for the first time since their return from America; it was successful more from the excellent acting of this gentleman and his wife, than from its own merit, which is not very great. The second novelty, *Advice Gratis*, was better, and exhibited Farren in an extremely amusing character, a *Mr. Oddbody*; he has a knack of advising every one exactly as they wish to be advised, and, consequently, his advice is much sought and always followed. There are many good incidents in this piece; and Farren was ably supported by Mr. F. Matthews and Mrs. Orger, who had also good parts. Both pieces have been played every evening since to capital houses.

*St. James's Theatre*.—This elegant place of amusement likewise opened on Friday, with a new piece, called *The Assignment*; it is extremely entertaining, and will, doubtless, become a favourite with the public. Mr. Braham has retained all the favourites of last season, and added established favourites from other theatres to his very efficient company. Among them we should notice Mr. Wright, a comedian of the Wrench school, and Mrs. Stirling, both of whom are seen to great advantage in *The Young Widow*. A new operatic burletta, entitled the *Cornet*, was produced on Thursday. We shall delay a more detailed notice till next week, by which time the *Cornet* will be established at the St. James's.

## VARIETIES.

*Singular Horse-cloth*.—A morning paper, in describing a recent inspection of some of the household troops by the Queen, says:—"Her majesty was mounted on a gray charger, richly caparisoned, and dressed in the Windsor uniform!"

*Caricature*.—Another excellent hit, in like-

nesses of Lord Melbourne and O'Connell, from the pencil of H. B., is before us, being No. 502, in his series of caricatures. It is a copy, in H. B.'s freest manner, of "Retzsch's extraordinary design of Satan playing at Chess with Man for his Soul," and is very happy in every respect.

**General Phipps.**—We read, with sincere regret, in the journals, an announcement of the death of this kind and amiable gentleman, at Venice, in his 77th year. General Phipps was an excellent judge of works of art, and an accomplished critic of the drama. Few men were more universally esteemed and beloved in society.

**Sir Egerton Brydges** has also paid the great debt of nature, in Switzerland, where he has resided a long time, in, we fear, very straitened and adverse circumstances. A scholar of very general attainments, there is hardly a branch of polite literature to which he has not largely devoted himself, and his productions, probably, exceed in extent those of any author since the days of Lopez de Vega.

**Weather-Wisdom.**—Not quite right nor quite wrong since our last, but too incorrect for us to repose our trust in the weather-wise: the week to come has "The air still cool, and rainy at the first quarter, on the 7th. A change on the 10th, but still cold and unsettled air about the 13th, the sun being then in aspect to Herschel."

**Cards.**—We have received a pack of cards from Messrs. Reynold, the pips of which are filled with grotesque faces; though too diverting for whist-players, they would be capital for a child's party, or a game of fright.

### LITERARY NOVELTIES.

The late Sir Egerton Brydges, Bart.—It is understood that the deceased baronet has by his will bequeathed the copyright of his works to his second son, the Rev. Egerton Brydges, M.A., by whom is contemplated the immediate publication of a new and uniform edition of the late poet's works, a large portion of which has never been before the public.

In the Press.

The Author's Advocate; and Young Publisher's Friend, by the Author of "The Perils of Authorship," &c.

### LIST OF NEW BOOKS.

The Principles of Midwifery, including the Diseases of Women and Children, by John Burns, M.D., F.R.S., 9th edition enlarged, 18s.—Berkeley's British Fungi, Fasciculus III., 4to. 1l.—Drake's Road Book of the Grand Junction Railway from Birmingham to Liverpool and Manchester, with a Map of the Entire Route, &c. &c., 12mo. 1s. 6d.—Sermons on Various Subjects, by the Rev. J. S. M. Anderson, M.A., &c. 8vo. 6d.—Dr. James Müller's Elements of Physiology, translated by William Baily, Part I., 8vo. 9s.—The Altar Service, by the Rev. S. Isaacson, A.M. 32mo. 1s. 6d.—Select Prayers, by ditto, ditto, 32mo. 1s. 6d.—Latin Homonyms, for Schools, by T. S. Carr, fcap. 3s.—Pratt's Statutes relating to the Office of a Justice of the Peace, 8vo. 6s.—Frogs of Aristophanes, with English Notes, by the Rev. H. P. Cookeley, 8vo. 7s.—Hone's Lives of Eminent Christians, Vol. III., fcap. 4s. 6d.—T. S. Carr's Latin Selections, fcap. 3s. 6d.—Dictionary of the Arts of Antiquity, by Julius Sillig, 8vo. 8s. 6d.—The Student's Companion to Apothecaries Hall, by E. Oliver, 32mo. 4s.—The Philosophy of Marriage, by M. Ryan, M.D., fcap. 6s.—Lochelev, and other Poems, by M. Bruce, with Life by Mackelvie, 12mo. 5s.—Chemistry of Nature, by Hugh Reid, 12mo. 5s.—Fisher's Juvenile Scrap Book, 1838, by Agnes Strickland and B. Barton, 8s.—The Christian Keepsake, 1838, 15s.—Fisher's Drawing-Room Scrap Book, 1838, 4to. 1l. 1s.—Maddocks's Practice of Chancery, 3d edit., 2 vols. royal 8vo. 2l. 13s. 6d.

### TO CORRESPONDENTS.

**ERRATA.**—Our copy of the Proceedings of the British Association having been despatched from the country on *maize*, an error was committed in the arrangement of last week's *Gazette*, by the insertion of Mr. Faraday's General Report of the Section, delivered at the amphitheatre on Friday night, among the miscellaneous papers of preceding dates. This portion, therefore, marked Section C. p. 628, cols. 2 and 3, ought to be read with the other Reports of Friday Evening, in winding up the Transactions. And, in No. 1079, p. 628, middle col., in the Reports, &c. recommended in Section B, for Professor Leibig on the Present State of Isomeric bodies, read Isomeric bodies.

### ADVERTISEMENTS, Connected with Literature and the Arts.

**WILL BE CLOSED ON SATURDAY, the 14th October.**—DIORAMA, REGENT'S PARK. New Exhibition, representing the interior of the Basilica of St. Paul, near Rome, before and after its Destruction by Fire; and the Village of Alagna, in Piedmont, destroyed by an Avalanche. Both Pictures are painted by Le Chevalier Bouton. Open daily, from Ten till Five.

### ARTISTS' and AMATEURS' CON- VERSATION, FRERES' TAVERN.

The Members of the Society are respectfully informed that the first Meeting will take place on the first Wednesday in November: the Subscriptions to be paid by October 11th, before which day the Names of new Candidates must be sent to the Hon. Sec., Henry Graves, 6 Pall Mall.

### ORIENTAL LITERATURE.

Professor Duncan Forbes will deliver his Introductory Lecture on Thursday, the 12th inst., at Three o'Clock precisely in the Afternoon. Any Gentleman presenting his card will be admitted to this Lecture. H. J. ROSE, B.D., Principal. King's College, London, Oct. 9, 1837.

### TO ARTISTS, TOURISTS, AND ADMIRERS OF THE FINE ARTS.

**PARLOUR'S PORTABLE SKETCH-  
ING-CASE, or DELINEATOR,** is confidently recommended to the notice of all persons attached to the Science of Drawing, as being infinitely superior to the Camera Lucida, and all other instruments hitherto invented, for the purpose of Sketching. The Sketching-Case may be held in the hand, and a correct Drawing made of any object or landscape; or it may be attached to a table, in the same manner as the Camera Lucida. It is simple in its construction, and does not excite in size, the common Sketching-Box. Manufactured for the Patience, by Reeves and Sons, 150 Cheapside; may be had, also, of Smith and Warner, Marylebone Street, Piccadilly; Watkins and Hill, Opticians, Charing Cross; and at all other Opticians and Artists' Repositories. Ladies and Gentlemen who have the Camera Lucida may have the Delineator affixed to their own stand.

### TO PUBLISHERS, AUTHORS, EN- GRAVERS, &c.

Printed for J. G. and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

Bishop Jeremy Taylor on Repentance.  
In small 8vo. price 6*s.* 6*d.* in cloth, and lettered,

**THE DOCTRINE AND PRACTICE OF REPENTANCE,**

extracted and abridged from the larger Work, upon the same Subject, of the Right Rev. JEREMY TAYLOR, D.D. Lord Bishop of Down and Connor.

By the Rev. WILLIAM HALE HALE, M.A.  
Prebendary of St. Paul's, Preacher of the Charter House, and Chaplain to the Lord Bishop of London.  
Printed for J. G. and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

**THE LETTERS OF THE MARTYRS:**

collected and published in 1594. With a Preface, By MILES COVERDALE;  
And with Introductory Remarks, By the Rev. EDWARD KESTETH,  
Rector of Watton, Herts.

Neatly printed, and illustrated with a Portrait of Miles Coverdale, an Engraving of the Burning of the Martyrs, and a Facsimile of the original Title-page. Small paper, price 10*s.*; large paper, 14*s.* cloth bound and lettered.  
John P. Shaw, Heathston Row, Russell Square; and John Johnstone, Edinburgh.

**ELECTION DAY; a Sketch from Nature, taken in the Nineteenth Century.**

London: Nimble, Marshall, and Co.; J. and J. Keene, Bath.

Recently published by James Fraser, 215 Regent Street, London. In 3 vols. crown 8vo. 1*l.* 1*l.* 6*d.* boards.

**THE FRENCH REVOLUTION,**

By THOMAS CARLYLE.  
Vol. I. The Bastille—Vol. II. The Constitution—Vol. III. The Guillotine.

"This is one of the few books of our time that are likely to live for some generations beyond it. Some years will pass before these volumes begin to be generally read; but when they will be, and that they will be, soon or later."—*Examiner*.

"There is no account of the French Revolution that can be in the slightest degree compared with this, for intensity of feeling and profundity of thought."—*Monthly Repository*.  
"After perusing the whole of this extraordinary work, we can allow, almost to that extent, the high qualities with which Mr. Carlyle's idolaters endow him."—*Times*.

**THE RELIQUES OF FATHER PROUT.**

With Eighteen Illustrations, by D. MacIles, Esq. A.R.A.  
"For learning, talent, and originality, no one has surpassed Father Prout."—*Literary Gazette*.

**RECOLLECTIONS OF SIR WALTER**

SCOTT, Bart. By R. P. GILLIES.  
Section I. His Boyhood and Youth—Section II. His Early Manhood—Section III. Love, Honour, Obedience, Troops of Friends—Section IV. The Bear and Yellow Leaf.  
"We have read this volume with much pleasure, and can cordially recommend it."—*Edinburgh Review*.

**VOYAGES to the Mediterranean and the**

Indian Seas; with Memoirs compiled from the Logs and Letters of a Midshipman. By John A. HERRARD, embellished with a Portrait and Engravings from Original Drawings, by the Subject of the Memoirs.  
"We have been deeply interested in reading this volume. We warmly recommend it."—*Naval and Military Gazette*.

**THE GREEK PASTORAL POETS:**

Theocritus, Bion, and Moschus. Translated by M. J. Chapman, with Notes.  
"The unobtrusive simplicity, the terse wit, the sylvan beauty, and poetical verse, that strike us at every turn with fresh delight, are here transferred to English with, we believe, as much purity as it was possible to render them. This is a treasury of sweets."—*Atlas*.

**TEMPLES, Ancient and Modern; or, Notes on Church Architecture.**

By William Bardwell, Architect.  
"A beautiful and valuable work, got up with much taste, and full of information. The illustrations are very numerous and interesting; and the notes, well digested, give an insight into the history of almost every remarkable temple erected to Jehovah from the earliest period."—*Literary Gazette*.

"This volume was dedicated, by express permission, to his late Most Gracious Majesty, William the Fourth, and is illustrated with Fifteen Plates and Forty-three Woodcuts.  
**FRASER'S PANORAMIC PLAN OF LONDON**, with all the Improvements to Michaelmas 1837.  
For the Pocket.—In a French Case, and embossed cloth, with the various Boundaries carefully outlined in outline, &c. &c. ditto, and beautifully embossed roan, the whole Map full coloured in a superior manner, &c. &c.  
For the Library, Drawing-Room, &c.—On black roller, coloured and varnished, &c. &c. On Mahogany roller, French polished, &c. &c.  
"This plan is about twenty-two inches in length, and a foot in breadth; so so clearly and accurately engraved, as to be adequate for all needs of reference. This of colour and the eye, and almost render the sheet pictures. For neatness, convenience, and general merit, we have no where seen a plan of our immense capital so worthy of public favour as this."—*Lit. Ges.*

**FRASER'S MAGAZINE. Half-a-Crown Monthly.**

Extract from "The Standard," of Sept. 30:—  
"We have been much pleased at the manner in which this periodical is invariably edited by the provincial papers; and we need scarcely remark that we entirely concur in the praise bestowed on it by our brethren of the press. There are now before us the 'Plymouth Herald' and the 'Leicester Journal.' The first says, 'This well-conducted and talented periodical stands exceedingly high, having acquired, in a few years, that extensive public support which many publications have been vainly endeavouring to obtain.' The 'Leicester Journal' is equally lavish in its praise, when it says, 'The varied merits which have exalted this invaluable periodical into a potent rival of 'Blackwood,' abound in the present Number. Not only for its powerful support of the Church and State, but for the individual merits of its contributors, 'Fraser's Magazine' cannot fail to maintain its lofty station in our periodical literature.'"  
Contents of the October Number.

**THE PYRAMIDS. Chap. I. Interior Mathematical Characters—**

—diffusions from the Journal of the Notices of the Royal Society: a Sketch—The Life of Lord Clive—The King's Pool—Vagaries by an Old Traveller. **MR. BENTLEY has just published the following New Works:—**

I.  
The Old Commodore.

By the Author of "Battlin the Reeler," &c. 3 vols.

II.  
THE LETTERS AND WORKS OF Lady Mary Wortley Montagu.

Edited by Lord Wharfedale.  
3d edition, revised, with Additions, in 3 vols. 8vo. with numerous fine Portraits.

III.  
The Vicar of Wrexhill.

By Mrs. Trellope.  
Author of "Domestic Manners of the Americans," "Jonathan Jefferson Whitlaw," &c.

3 vols. with numerous Illustrations by Harriet.

IV.  
MR. IRVING'S NEW ROMANCE. The Hunters of the Prairie;

Or, the Hawk Chief. 2 vols. 18*s.*

V.  
Also, just ready, Italy.

By J. Fenimore Cooper, Esq.  
Author of "The Pilot," "The Spy," "England," &c. 3 vols. post 8vo.

VI.  
The Squire.

By the Author of "The Merchant's Daughter," "The Helms," &c. 3 vols.

Richard Bentley, New Burlington Street, (Publisher in Ordinary to Her Majesty).

13 Great Marlborough Street, Oct. 6, 1837.

MR. COLBURN'S NEW PUBLICATIONS,  
NOW READY.

MISS LANDON'S NEW NOVEL.  
ETHEL CHURCHILL;

OR, THE TWO BRIDES. A Story of the Reign of George II. 3 vols.

"Such a record of female sentiment and passion, as has hardly been published since the days of 'Corinne.'"—*Times*.

LIFE OF SIR EDWARD COKE,

Lord Chief-Justice in the Reign of James I. With Memoirs of his Contemporaries.

By C. W. JOHNSON, Esq. Barrister-at-Law. In 2 vols. 8vo. with Portrait.

STORIES OF SPANISH LIFE.

Edited by Lieut.-Col. CRAUFURD, Grenadier Guards. In 2 vols. post 8vo.

"These volumes are a welcome and valuable addition to English Literature, giving by far the best view of Spanish Life we have yet met with. No modern writer has so thoroughly penetrated the Spanish character, in its strength and its weakness, its vices, its virtues, and its peculiarities. The vices of the Spanish character, its disregard of shedding blood, its abject superstition, its wild revenge, are drawn with vivid and startling effect."—*Spectator*.

UNCLE HORACE.

By the Authoress of "Sketches of Irish Character," "The Buccaneer," &c.  
In 3 vols. post 8vo.

"Mrs. Hall's new and delightful novel, bearing the title of 'Uncle Horace,' more than sustains the high reputation of its popular writer. Its bachelor hero, Uncle Horace, is a capital and original sketch—more truly and emphatically English than any character of the kind we are acquainted with. This delightful work deserves to attain a popularity not surpassed by that of any female writer of the day."—*Globe*.

THE SPAS OF GERMANY.

By Dr. GRANVILLE, Author of "Travels to St. Petersburg," &c.  
In 2 vols. 8vo. with numerous Illustrations, bound.

"To one who purposes to visit the German Spas, Dr. Granville's book is as necessary as his portmanteau or his travelling bag, or his purse to pay his way. It informs him upon every point on which he is likely to seek intelligence—the quality of every spring, its uses and effects, the constitutions or diseases it will aid or prejudice, the character of the town in which it is situated, the kind of company to be met with, the manners and charges of the attendants, with a thousand other particulars, most important to the traveller. Lastly, it sparkles with amusing anecdotes, and wherever a capital graphic cut will serve to assist description of site or scenery, it is introduced, and adds no small merit or utility to the performance."—*Bath Herald*.

CAPTAIN MARRYAT'S NEW NOVEL.

SNARLEY YOW; or, the DOG FIEND.

SECOND EDITION, in 3 vols. post 8vo.

"Not inferior to any of Capt. Marryat's previous works, 'Peter Simple' alone excepted. It is grotesque and humorous from beginning to end."—*Athenæum*.

"This is a work in a completely new style, and full of spirit it is. The dash of historic character gives great effect to the wild and animated narrative."—*Lit. Gazette*.

THE CITY OF THE SULTAN;

Or, Domestic Manners of the Turks.

By MISS PARDOE, Authoress of "Traits and Traditions of Portugal," &c.  
In 2 vols. 8vo. with numerous Illustrations.

"We have followed Miss Pardoe, at once thrilled and excited, from the regal hall to the mad-house—from the marble-lined mosque of St. Sophia to the boatman's mud-built hovel—from the subterranean cisterns of Constantinople to the cloud-enveloped summit of Mount Olympus. In her delightful society we have feasted with pashas and conversed with patriarchs, gossiped with dark-eyed Circassian beauties, and bowed beneath the spell of Georgian loveliness. Miss Pardoe has left nothing unobserved, and has produced a book as instructive and amusing as it is curious."—*Court Journal*.

STOKESHILL PLACE; or, the Man of Business.

By the Authoress of "Mrs. Armytage," &c. SECOND EDITION, 3 vols.

"This new novel will increase the already well-earned reputation of Mrs. Gore. It is extremely well written. Mrs. Gore depicts the conventional characters of society, and the secret springs by which human motives are governed, with equal felicity. An excellent moral is elicited by the events and the catastrophe of 'Stokeshill Place.'"—*Times*.

TRAVELS IN CIRCASSIA, KRIM TARTARY, &c.

In 1836-7, including a Steam Voyage down the Danube, from Vienna to Constantinople, and round the Coast of the Black Sea.

By EDMUND SPENCER, Esq. Author of "Germany and the Germans."

In 2 vols. 8vo. with Map of the Black Sea, and numerous Illustrations, bound.

"We are delighted with this work, and yet we do not know whether to say it is more interesting or important."—*Literary Gazette*.

MR. BURKE'S HISTORY OF THE LANDED GENTRY.

A COMPANION TO THE PEERAGE AND BARONETAGE.

PART VIII., Small Paper Edition, price 4s. 6d. To be completed in Sixteen Monthly Parts, comprising Accounts of all the Eminent Families in the United Kingdom, and of upwards of 100,000 Individuals connected with them. Illustrated with the Armorial Bearings of each Family, Portraits, &c.

THE FOLLOWING ARE JUST READY.

PASCAL BRUNO;

A SICILIAN STORY. Edited by THEODORE HOOK, Esq. 1 vol. post 8vo.

THE BENCH AND THE BAR.

By the Author of "Random Recollections of the Lords and Commons," "The Great Metropolis," &c. 2 vols. post 8vo.

SURVEYING VOYAGE OF HIS MAJESTY'S SHIPS

ADVENTURE AND BEAGLE.

Between the Years 1825 and 1836.

By Captains KING and FITZROY, R.N. With Extracts from the Journal of C. DARWIN, Esq. M.A. In 3 vols. 8vo.

Printed by JAMES MOYER, of Brook Green, Hammersmith, in the County of Middlesex, Printer, at his Printing Office, Number 28 Castle Street, Leicester Square, in the said County: and published by WILLIAM ARMIGER SCRIPPS, of Number 12 South Molton Street, in the Parish of Saint George, Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Waterloo Bridge, Strand, in the said County, on Saturday, October 7th, 1837.

Agent for Paris, G. W. M. Reynolds, Librairie des Brangères, 5 Rue Neuve, St. Augustin.

# THE LITERARY GAZETTE;

#### REVIEW OF NEW BOOKS.

*The Life of Sir Edward Coke; with Memoirs of his Contemporaries.* By C. W. Johnson, Esq. 2 vols. 8vo. London, 1837. Colburn.

THIS is a very valuable work, illustrating one of the most important periods in our history, and written in a candid spirit, whose judgment is based on materials collected with great industry. It was a remarkable time, fertile in remarkable men; and Coke was of the first order, whether with reference to his talents or to the part that he played. As, however, our columns are no place for political discussion, we shall rather choose our extracts from portions whose interest is of a more general order.

*Diary of a Canvassing Member.*—"About the year 1640, in a private manuscript, J. Harrington, Esq. of Kelston, Somersetshire, thus described his canvass, in the December of that year.

"*A Note of my Bathe Business about the Parliament.*

"Saturday, December 26. Went to Bathe and dined with the maior and citizens; conferred about my election to serve in parliament, as my father was helpless, and ill able to go any more. Went to the George Inn at night; met the bailiffs, and desired to be dismissed from serving; drank strong beer and metheglin (mead); expended about three shillings; went home late; but could not get excused, as they entertained a good opinion of my father.—Monday, December 28. Went to Bathe; met Sir John Horner; we were chosen by the citizens to serve for the city; the maior and citizens conferred about parliamentary business. The maior promised Sir John Horner and myself a horse a piece, when we went to London to the parliament, which we accepted off; and we talked about the synod and ecclesiastical dismissions. I am to go again on Thursday and meet the citizens about all such matters, and take advice thereon.—Thursday, 31. Went to Bathe; Mr. Ashe preached; dined at the George Inn with the maior and four citizens: spent at dinner six shillings in wine. Laid out in victuals, at the George Inn, xix. 4d.; laid out in drinking, viis.; laid out in tobacco and drinking vessels, iiii. 4d.—January 1. My father gave me 4l. to bear my expenses to Bathe. Mr. Chapman, the maior, came to Kelston, and returned thanks for my being chosen to serve in parliament, to my father, in the name of all the citizens. My father gave me good advice touching my speaking in parliament as the city should direct. Came home late at night from Bathe: much troubled heretofore concerning my proceeding, truly for men's good report and mine own safety.—Note. I gave the city messenger iis. for bearing the maior's note to me: laid out in all viiis. for victuals, drink, and horsehire, together with divers gifts."

The marriage of his daughter, hoping by that means to regain the court favour lost by his upright conduct as judge, is a strange picture of the times, and ends most miserably.

"The Reverend George Garrad, in a letter to Lord Deputy Wentworth, dated March 17, 1637, remarked,—'Here is a new business revived; your lordship hath heard of a strong

friendship heretofore betwixt Sir Robert Howard and the Lady Purbeck, for which she was called into the high commission, and there sentenced to stand in a white sheet in the Savoy church, which she avoided then by flight, and hath not been much looked after since, having lived much out of town, and, constantly these last two years with her father, at Stoke, until he died; but this winter she lodged herself on the water side, over against Lambeth, I fear too near the road of the Archbishop Barge, whereof some complaint being made, she had a sergeant-at-arms sent with a warrant from the lords of the council to send her to the gatehouse, whence she will hardly get out until she have done her penance. The same night was a warrant sealed, signed by the lords, to the warden of the Fleet, to take Sir Robert Howard, at Suffolk House, and to carry him to the Fleet; but there was never any proceeding against him, for he refused to take the oath *ex-officio*, and had then the parliament to back him out, but I fear he will not escape now.' Two months afterwards, Mr. Garrad, in addressing the lord deputy, May 19, 1635, reported,—'No news yet of the Lady Purbeck, since her escape out of the gatehouse; but Sir Robert Howard lies before it still a close prisoner in the Fleet; being so committed from the High Commission Court, until he shall bring her forth, who, being there, cannot do it, for he sees nobody; and, if he were out, would not do it. So that he is like miserable and like to pay dear for his unlawful pleasures.' And on the 24th of June, 1635, he writes,—'Sir Robert Howard, after one month's close confinement in the Fleet, obtained his liberty, giving two thousand pounds bond, never more to come at the Lady Purbeck, wherein he stands bound alone; but for his appearance within thirty days, if he be called, two of his brothers stand bound with him in fifteen hundred pounds; so I hope there is an end of that business. The lady, I hear, passed in man's clothes, first into Jersey, since, she is gone to France, and there means to continue.' And finally, the Reverend George Garrad, when writing to the Lord Deputy Wentworth, July 30, 1637, told him,—'The Lady Purbeck is heard of. It seems she went first into the Isle of Guernsey, disguised in man's apparel. You know who is governor there, her kinsman, the Earl of Danby; but he knew nothing of it. Thence she went to St. Maloe's, and is still in one part of France, where I wish she might stay, but it seems not good so to the higher powers, for there is of late an express messenger sent to seek her, with a privy seal from his majesty, to summons her into England, within six months from the receipt thereof, which, if she does not obey, she is to be proceeded against according to the laws of this kingdom.'

*Coke's Monument.*—"Tittleshall church contains his monument, as well as his grave. The tombstone was erected, according to Walpole, by Nicholas Stone, master mason, at the cost of four hundred pounds. It is of polished marble; on the top are his armorial bearings, with the four cardinal virtues. On this tomb is also a full-length effigy, with an inscription,

which I subjoin in Latin and in English. The motto is affixed, '*Prudens qui Patiens.*'

*Comparison between Coke and Bacon.*—It begins with Bacon's eloquent letter published in "The Cabala," and adds—"Such were the angry, though half friendly, admonitions of the great Bacon to his talented rival. He could find in Coke's character but two causes of accusation—he was avaricious, he was talkative. The man who, with an immense professional income, buried himself in his chambers, could have had but few sources of expenditure. Coke's income, from his studious habits, would of necessity largely exceed his expenditure; and, if he did talk occasionally at too great a length, it is a crime which other great judges have committed with perfect impunity; and their sovereigns, far greater monarchs than James the First, never thought they ought, in consequence, to be removed from the bench. And if Coke did not always write or talk in the language of a philosopher, neither did he use to his sovereign the language of the convicted betrayer of justice, or write receipts for the wages of his corruptions. It is little surprising, that if these were Coke's greatest crimes, that it should be said of him by his master, King James, 'Whatever way that man falls, he will alight upon his legs.' Sir Edmund Coke and Francis Lord Bacon were by far the most extraordinary men of their age. England had never before seen two such legal rivals in her courts, and time has not since produced any two lawyers who can be compared to these great opponents in her Augustan age. Widely differing, however, as these two great men did, in character, they yet resembled each other in many circumstances of their splendid career. They were both elevated by the smiles of the court; they were both, in some measure, sacrificed to propitiate the clamours of a party. They both trusted too much to the friendship of the regal favourite; both courted the favour of Villiers, duke of Buck-

\* "Nicholas Stone, who erected this fine monument, was the most celebrated person in his day for tombstones, and other memorials of the dead: he appears to have been very extensively employed, and to have obtained very great prices, when the value of money and other circumstances are taken into consideration. He kept an account in a pocket-book of the work he performed, the prices he obtained, and the treatment he received from his employers. The book was in the possession of Virtue, and employed by Horace Walpole in his '*Anecdotes of Painting*,' who has given several extracts. Thus he tells us, that he erected the monument of Coke, at the church of Tittleshall, in Norfolk, for which he was paid four hundred pounds; he had before been employed on a statue of Sir Edward Coke,—for in the account of the various sums of money paid to his workmen for wages, is this entry:—1629. John Hargrave made a statue from Sir Edward Coke for 15l. For the Paston family, from whom Coke had his first wife, he was exclusively employed, he tells us:—And in 1629, I made a tomb for my Lady Paston, of Norfolk, and set it up at Paston; and was very extraordinarily entertained there, and paid for it 340l. And in 1632, I made a chimney-piece for Mr. Paston, set up at Oxnett, in Norfolk, and for the which I had 80l.; and one statue of Venus and Cupid, and had 30l. for it; and one statue of Jupiter, 25l.; and the three-headed dog Cerberus, with a pedestal, 14l.; and Ceres, and Hercules, and Mercury, 50l.; and a tomb of my Lady Catherine, his dear wife, 200l.; and a little chimney-piece in a banquetting-house, 30l.; and one range marble table with a foot, 15l.; and divers other things sent down from time to time, as painting of arms, &c.; and in May 1641, sent to him three statues, the one Apollo, Diana, Juno,—agreed for 25l. a piece, with pedestals. The statues of Ceres, Hercules, and Mercury, according to Walpole, were, upon the extinction of the Paston family, transferred to Lord Buckingham's seat, at Blickling."

ingham, with an earnestness equally intense and disgraceful. They had each dark shades in their character. If Coke was proud and avaricious, Bacon was meanly subservient; and unblushingly took bribes, mis-called presents, from the suitors in his court. If Coke was economical, and even parsimonious, he died rich; if Bacon was generous and liberal, he died in debt. They differed, too, in the nature of their attainments. Bacon excelled in general knowledge—was profound in the highest walks of philosophy. Coke had paid little attention to these noble researches; his philosophy made him believe in witches, conjurers, and in the promises of the alchemist; but in history, in all the deep readings of the common and statute law, he left his great opponent at an immeasurable distance. Bacon had the greater genius; Coke the most industry and application: the first had a mind the most comprehensive, and capable of the highest flights; the last had the greater power of application and of exclusive attention. The mind of the one was as utterly incapable of producing the *Novum Organum*, as the other was to luxuriate among the dry immortal sections of the Commentaries upon Littleton. Queen Elizabeth decided in this spirit, when Essex so perseveringly advocated Bacon's interests for the vacant solicitor-generalship; she admitted his philosophy when she doubted the depth of his law. Their rivalry, too, was remarkable both for its intenseness and its long duration. They were rivals as pleaders; competitors for the same law offices under the crown; and even struggled to obtain the same lady in marriage. Both of these two great men attained the highest legal situations. Bacon became the head of the court of equity; Coke held the highest common law office in the gift of the crown. Both were charged with malversation in the administration of their official duties: one with the unsoundness of his law, the other with the badness of his equity. The king removed his chief justice; the parliament impeached and disqualified the chancellor. Both died in disgrace, though they had partially recovered the smiles of royalty. Bacon was at the house of a stranger, in which he had taken refuge, when he was suddenly attacked with his mortal malady; and Coke had hardly a more peaceful death, for, in his last hour, his house was searched, and his papers seized by the officers of the crown. Coke was ten years of age, when Bacon was born; they had both the advantage of powerful connexions; both married well. Bacon had the most brilliant, Coke the most lengthened career, for he survived his great opponent about eight years. Time, which sobers the contentions of political parties, has assigned to each their respective meed of praise and of condemnation. The general reader has long since yielded to both their equal mixture of praise and reprobation. The name of Coke to such students of England's history, brings to mind his immortal Comments, his Reports, and the way in which he bullied poor Raleigh at Winchester. Bacon's name he associates with all that is triumphant in modern experimental philosophy, and disgraceful in the conduct of a chief judge in equity. They were both great men; both had their weak points; and are both entitled to the grateful plaudits of posterity."

*The Peerage in the Coke Family.*—"Sir Edward Coke died a commoner; his name was not enrolled amongst the peers, and his descendants are still numbered with the great and leading commoners of England. It is true that one branch of his descendants was for a generation elevated to the peerage; that they

have had one Earl of Leicester in the family, but it was for one generation only, the holder of the title long outliving his talented and only son. To the family, the name of Coke is sufficiently honourable, for, amongst lawyers and legislators, the name would derive no additional lustre from his being created a peer. It is true that William Pitt, 'the boy minister of England,' was willing to wipe away the reproach that the peers of England did not have a Coke amongst their number; it is true that he tendered a peerage to the present Mr. Coke; an offer which was certainly declined. A vague rumour is prevalent in the east of England, that the reason for the refusal arose from the hesitation of Mr. Pitt to grant the title of Leicester. But this report I know to be erroneous. Mr. Coke himself told me, that he refused a peerage from William Pitt, because he could not support the minister who proffered him the honour. That he should in such case have had to oppose the man who gave him his seat in the upper house. The feelings of these two great men were equally honourable; they felt, as men of their minds should feel, above the little paltry calculations of every day life. Pitt through life had but one great object, the greatness and glory of his country; for this he laboured the lifelong day: for England he pleaded by the light of the midnight lamp before her assembled commoners: for her he was a martyr. Coke has had a more limited sphere, it is true, but what he had to do he did well. He refused his peerage rather than incur any suspicion of political ingratitude. And principally through his noble exertions, the agriculturists of England have taken a rank among the scientific cultivators of the earth, which they never before attained. Yet, I confess, I would rather witness the representative of the Coke family sitting in the same house, which numbers amongst its members the descendants of so many other great lawyers, and that the Fortescues, Littletons, Somers, Kings, Mansfields, Hardwicks, and a host of other great names, should derive still greater honour by the addition to their number of the descendants of the greatest lawyer which their country ever produced."

There are slight, but well-written memoirs of various persons connected with the period. Mr. Johnson has neglected nothing that could make his work complete; and it does equal honour to his intelligence and his industry.

#### *Fisher's Drawing-Room Scrap-Book for 1838.*

With poetical illustrations by L. E. L. 4to. pp. 54. London, Fisher and Co.: Germany, Black and Armstrong, and Asher.

THE best criticism on this established favourite with the public will be to quote it; and the following poems will speak for themselves, especially the touching stanzas which illustrate the portrait of Mrs. Hemans:—

#### "*Felicia Hemans.*"

No more, no more—oh! never more returning,  
Will thy beloved presence gladden earth;  
No more wilt thou, with sad yet anxious yearning,  
Cling to those hopes which have no mortal birth.  
Thou art gone from us, and with thee departed,  
How many lovely things have vanished too:  
Deep thoughts that at thy will to being started,  
And feelings, teaching us our own were true!  
Thou hast been round us, like a viewless spirit,  
Known only by the music on the air;  
The leaf or flowers which thou hast named inherit  
A beauty known but from thy breathing there;  
For thou didst on them fling thy strong emotion,  
The likeness from itself the fond heart gave;  
As planets from afar look down on ocean,  
And give their own sweet image to the wave.  
And thou didst bring from foreign lands their treasures,  
As floats thy various melody along;  
We know the softness of Italian measures,  
And the grave cadence of Castilian song.

A general bond of union is the poet,  
By its immortal verse is language known,  
And for the sake of song do others know it—  
One glorious poet makes the world his own.  
And thou—how far thy gentle sway extended!  
The heart's sweet empire over land and sea;  
Many a stranger and far flower was blended  
In the soft wreath that glory bound for thee.  
The echoes of the Susquehanna's waters  
Paused in the pine-woods words of thine to hear;  
And to the wide Atlantic's younger daughters  
Thy name was lovely, and thy song was dear.  
Was not this purchased all too dearly?—never  
Can fame atone for all that fame hath cost.  
We see the goal, but know not the endeavour,  
Nor what fond hopes have on the way been lost;  
What do we know of the unquiet pillow,  
By the worn cheek and tearful eyelid prest,  
When thoughts chase thoughts, like the tumultuous  
billow.

Whose very light and foam reveals unrest?  
We say, the song is sorrowful, but know not  
What may have left that sorrow on the song;  
However mournful words may be, they shew not  
The whole extent of wretchedness and wrong.  
They cannot paint the long sad hours, passed only  
In vain regrets o'er what we feel we are.  
Alas! the kingdom of the lute is lonely—  
Cold is the worship coming from afar.  
Yet what is mind in woman, but revealing  
In sweet clear light the hidden world below,  
By quicker fancies and a keener feeling  
Than those around, the cold and careless, know?  
What is to feed such feeling, but to culture  
A soil whence pain will never more depart?  
The fable of Prometheus and the vulture  
Reveals the poet's and the woman's heart.  
Unkindly are they judged—unkindly treated—  
By careless tongues and by ungenerous words;  
While cruel sneer, and hard reproach, repeated,  
Jar the fine music of the spirit's chords.  
Wert thou not weary—thou whose soothing numbers  
Gave other lips the joy thine own had not?  
Didst thou not welcome thankfully the slumbers  
Which closed around thy mourning human lot?  
What, on this earth, could answer thy requiring,  
For earnest faith—for love, the deep and true,  
The beautiful, which was thy soul's desiring,  
But only from thyself its being drew.  
How is the warm and loving heart requited  
In this harsh world, where it awhile must dwell!  
Its best affections wronged, betrayed, and slighted—  
Such is the doom of those who love too well.  
Better the weary dove should close its pinion,  
Fold up its golden wings and be at peace.  
Enter, O lady, that serene dominion,  
Where earthly cares and earthly sorrows cease.  
Fame's troubled hour has cleared, and now replying,  
A thousand hearts their music ask of thine.  
Sleep with a light the lovely and undying  
Around thy grave—a grave which is a shrine."

#### "*The Tombs of the Kings of Golconda.*"

Morning is round the shining palace,  
Mirrored on the tide,  
Where the lily lifts her chalice.  
With its gold inside,  
Like an offering from the waves.  
Early wakened from their slumbers,  
Stand the glittering ranks;  
Who is there shall count the numbers  
On the river's banks?  
Forth the household pours the slaves  
Of the kings of fair Golconda,  
Of Golconda's ancient kings.

Wherefore to the crimson morning  
Are the banners spread,  
Daybreak's early colours scorned  
With a livelier red?  
Pearls are wrought on each silk fold.  
Summer flowers are flung to wither  
On the common way.  
Is some royal bride brought hither  
With this festival array,  
To the city's mountain-hold  
Of the kings of old Golconda,  
Of Golconda's ancient kings.

From the gates the slow procession,  
Troops and nobles come.  
This hour takes the king possession  
Of an ancient home—  
One he never leaves again.  
Musk, and sandal-wood, and amber,  
Flung around their breath:  
They will fill the murky chamber  
Where the bride is death.  
Where the worm hath sole domain  
O'er the kings of old Golconda,  
O'er Golconda's ancient kings.

Now the monarch must surrender  
All his golden state,  
Yet the mockeries of splendour  
On the pageant wait  
That attends him to the tomb.  
Music on the air is swelling,  
'Tis the funeral song,  
As to his ancestral dwelling,  
Is he borne along.

They must share life's common doom,  
The kings of fair Golconda,  
Golconda's ancient kings.

What are now the chiefs that gather?  
What their diamond mines?  
What the heron's snowy feather  
On their crest that shines?

What their valleys of the rose?  
For another is their glory,  
And their state, and gold;  
They are a forgotten story,  
Faint and feebly told—

Breaking not the still repose  
Of the kings of fair Golconda,  
Of Golconda's ancient kings.

Glorious is their place of sleeping,  
Gold with azure wrought,  
And embroidered silk is sweeping,  
Silk from Persia brought.

Round the carved marble walls,  
Not the less the night-owl's pinion  
Stirs the dusky air;  
Not the less is the dominion  
Of the earth-worm there.

Not less deep the shadow falls  
O'er the kings of fair Golconda,  
O'er Golconda's ancient kings.

Not on such vain aids relying,  
Can the human heart  
Triumph o'er the dead and dying;  
It must know its part

In the glorious hopes that wait  
The bright openings of the portal,  
Far beyond the sky—  
Faith, whose promise is immortal,  
Life, that cannot die.

These, and stronger than the state  
Of the kings of fair Golconda,  
Of Golconda's ancient kings."

#### The Pirate.

"Down, 'mid the waves, accursed bark,  
Down, down before the wind;  
Thou canst not sink to doom more dark  
Than that thou leav'st behind.

Down, down for his accursed sake  
Whose hand is on thy helm.  
Above the heaving billows break—  
Will they not overwhelm?

The blood is red upon the deck,  
Of murder, not of strife;  
Now, Ocean, let the hour of wreck  
Atone for that of life!

Many a brave heart has grown cold,  
Though battle has been done;  
And shrieks have risen from the hold,  
When human help was none.

We've sailed amid the Spanish lines,  
The black flag at the mast,  
And burning towns and rifled shrines  
Proclaimed where we had past.

The captive's low and latest cry  
Has risen on the night,  
While night-carousals mocked the sky  
With their unholy light.

The captain he is young and fair—  
How can he look so young?  
His locks of youth, his golden hair,  
Are o'er his shoulders flung.

Of all the deeds that he has done,  
Not one has left a trace:  
The midnight cup, the noontide sun,  
Have darkened not his face.

His voice is low—his smile is sweet—  
He has a girl's blue eyes;  
And yet I would far rather meet  
The storm in yonder skies.

The fiercest of our pirate band  
Holds at his waist the breath;  
For there is blood on his right hand,  
And in his heart is death.

He knows he rides above his grave,  
Yet careless is his eye;  
He looks with scorn upon the wave,  
With scorn upon the sky.

Great God! the sights that I have seen,  
When far upon the main!  
I'd rather that my death had been  
Than see those sights again.

Pale faces glimmer, and are gone,  
Wild voices rise from shore;  
I see one giant wave sweep on—  
It breaks!—we rise no more."

The binding is very pretty this year—dark green embossed with gold; indeed, the whole volume is got up with exquisite taste.

*Goethe's Correspondence with a Child.* 2 vols.  
Longman and Co. 1837.

THIS is one of those singular productions which never could have been produced in any

country but Germany; and it is one of which an English reader will have great difficulty in forming a judgment. There is a simplicity foreign to our manners—a sentimentality, which only appears to us ridiculous—and we have no sympathy with the unquestioning admiration which made Goethe an object of almost religious veneration with the German people: a child of some thirteen or fourteen years of age forming, on hearsay, a romantic passion for a gray-haired poet of some sixty or seventy, and carrying on a correspondence, exaggerated and wild to a degree, is an exotic that would find no growth on our quiet and cold soil; and we must frankly confess, we see no reason to wish that it should. There is a great deal in these letters open to ridicule; and yet ridicule is not a test to which we feel the least inclined to submit them. Still less are we inclined to judge them more harshly. Bettine is obviously a clever and enthusiastic child, whose imagination has been excited by long conversations with Goethe's mother, who made, completely, an idol of her son. Goethe, himself, takes the matter quietly enough: the young German girl's romantic passion is merely one of many shapes taken by the admiration of his followers—he is neither flattered nor touched; but the trying love of the young and eager heart, full of follies, fancies, and excitement, is rather a curious and amusing study. The following passages will give some slight idea of the spirit of these letters.

*Original Simile of a Lover.*—"In the night, he is the blanket in which I wrap myself."

*Metaphysics.*—"Talent strikes conviction, but genius does not convince: to whom it is imparted, it gives forebodings of the immeasurable and infinite; while talent sets certain limits, and so, because it is understood, is also maintained. The infinite in the finite; genius in every art is music. In itself it is the soul, when it touches tenderly; but when it masters this affection, then it is spirit which warms, nourishes, hears, and reproduces the own soul—and, therefore, we perceive music; otherwise, the sensual ear would not hear it, but only the spiritual: and thus, every art is the body of music, which is the soul of every art. And so is music, too, the soul of love, which also answers not for its working; for it is the contact of divine with human, and, once for all, the divine is the passion which consumes the human. Love expresses nothing through itself, but that it is sunk in harmony."

*Another curious Simile.*—"I write to you in crystal midnight; black basaltic country, dipped in moonlight! The town forms a complete cat's back, with its ducking houses, and is quite furred with bristling points of rock and mountain ruins; and there, opposite, it shines and flickers in the shade, as when one rubs the cat's back."

*Sketch of Jacobi.*—"Jacobi is tender as a Psyche waked too early: touching! were it possible, one might learn something of him, but impossibility is a peculiar demon, which, cunningly, knows how to baffle all to which one feels oneself entitled: thus I always think when I see Jacobi surrounded by literati and philosophers, it would be better for him to be alone with me. I am persuaded my unaffected questions, in order to learn of him, would cause more life-warmth within him, than all those who conceive it necessary to be something in his presence. Communication is his highest enjoyment: he appeals in all to his springtime; each full-blown rose reminds him forcibly of those which once bloomed for his enjoyment; as he softly wanders through the groves, he

relates how once friends twined their arms in his amid delightful converse, which lasted till late in the warm summer night. And he still remembers something of each tree of Pempelfort; of the harbour by the water, upon which the swans circled; on which side the moon broke through upon the neat flints; where the wagtails strutted: all this comes forth from him, like the tone of a solitary flute; it shows that the spirit still abides here, but in its peaceful melodies the yearning after the infinite is expressed. His remarkably noble figure is fragile; it is as if the case could easily be destroyed, to set the spirit at liberty."

The account of Beethoven, and his own conversation, are written in the full sweep of German idealism:—

"To you I may confess, that I believe in a divine magic, which is the element of mental nature. This magic does Beethoven exercise in his art; all relating to it, which he can teach you, is pure magic; each combination is the organisation of a higher existence, and thus, too, does Beethoven feel himself to be the founder of a new sensual basis in spiritual life. You will understand what I mean to say by this, and what is true. Who could replace this spirit? From whom could we expect an equivalent? The whole business of mankind passes to and fro before him like clock-work. He alone produces freely from out himself the unforeseen, the uncreated. What is intercourse with the world to him, who, ere the sun rise, is already at his sacred work; and who, after sunset, scarcely looks around him; who forgets to nourish his body, and is borne in his flight on the stream of inspiration, far beyond the shores of flat, every day life? He says, himself, 'when I open my eyes, I cannot but sigh, for what I see is against my religion, and I am compelled to despise the world, which has no presentiment that music is a higher revelation than all their wisdom and philosophy: music is the wine, which inspires new creations, and I am the Bacchus, who presses out this noble wine for mankind, and makes them spirit-drunk; and, then, when they are sober again,—what have they not fished up to bring with them to dry land? I have no friend: I must live with myself alone; but I well know that God is nearer to me in my art than to others; I commune with Him without dread; I have ever acknowledged and understood him. Neither have I any fear for my music; it can meet no evil fate: he to whom it makes itself intelligible, must become freed from all the wretchedness which others drag about with them.'

"I found him upon the third floor; unannounced, I entered. He was seated at the piano. I mentioned my name; he was very friendly, and asked if I would hear a song that he had just composed? Then he sung, shrill and piercing, so that the plaintiveness reacted upon the hearer, 'Know'st thou the Land.' 'It's beautiful, is it not,' said he, inspired, 'most beautiful! I will sing it again.' He was delighted at my cheerful praise. 'Most men,' said he, 'are touched by something good, but they are no artist-natures: artists are ardent, they do not weep.' Then he sung another of your songs, to which he had, a few days ago, composed music, 'Dry not the tears of eternal love.' He accompanied me home, and it was upon the way that he said so many beautiful things upon art. Withal, he spoke so loud, stood still so often upon the street, that some courage was necessary to listen: he spoke passionately, and much too startlingly, for me not also to forget that we were in the street. They

were much surprised to see me enter with him in a large company assembled to dine with us. After dinner, he placed himself, unasked, at the instrument, and played long and wonderfully: his pride and genius were both in ferment. Under such excitement his spirit creates the inconceivable, and his fingers perform the impossible.

"Yesterday, I walked with him in a splendid garden, in full blossom, all the hot-houses open: the scent was overpowering. Beethoven stood still in the burning sun, and said, 'Goethe's poems maintain a powerful sway over me, not only by their matter, but also their rhythm; I am disposed and excited to compose by this language, which ever forms itself, as through spirits to more exalted order, already carrying within itself the mystery of harmonies. Then, from the focus of inspiration, I feel myself compelled to let the melody stream forth on all sides—I follow it—passionately overtake it again—I see it escape me—vanish amidst the crowd of varied excitements—soon I seize upon it again with renewed passion; I cannot part from it,—with quick rapture I multiply it in every form of modulation, and, at the last moment, I triumph over the first musical thought,—see now—that's a symphony:—yes, music is indeed the mediator between the spiritual and sensual life. I should like to speak with Goethe upon this, if he would understand me. Melody is the sensual life of poetry. Do not the spiritual contents of a poem become sensual feeling through melody? do we not, in Mignon's song, perceive its entire sensual frame of mind through melody? and does not this perception excite again to new productions?—There, the spirit extends itself to unbounded universality, where all in all forms itself into a bed for the stream of feelings, which take their rise in the simple musical thought, and which else would die unperceived away: *this* is harmony—this is expressed in my symphonies; the blending of various forms rolls on, as in a bed, to its goal. Then one feels, that an eternal, an infinite, never quite to be embraced, lies in all that is spiritual; and although, in my works, I have always a feeling of success, yet I have an eternal hunger,—that what seemed exhausted with the last stroke of the drum, with which I drive my enjoyment, my musical convictions into the hearers,—to begin again like a child. \* \* \*

"We do not know what grants us knowledge; the firmly enclosed seed needs the moist, warm, electric soil to grow, think, express itself. Music is the electric soil in which the spirit lives, thinks, invents. Philosophy is the precipitation of its electric spirit, and its necessity, which will ground every thing upon a first principle, is supplied by music; and, although the spirit be not master of that which it creates through music, yet is it blessed in this creation: in this manner, too, is every creation of art, independent, mightier than the artist himself, and returns, by its appearance, back to the divine, and is only connected with men in so much as it bears witness to the divine mediation in him. Music gives to the spirit relation to harmony. A thought abstracted, has still the feeling of communion, of affinity in the spirit: thus each thought in music is in the most intimate, inseparable affinity with the communion of harmony, which is unity."

The reminiscences of Goethe's childhood are curious.

"He did not like playing with little children, unless they were very pretty. Once he began suddenly to cry and shriek, 'the black child shall get out, I can't bear it; neither did he come crying till he got home, when his mother

asked him how he could be so naughty; he could not console himself for the child's ugliness. He was then three years old. \* \* \*

"For his little sister Cornelia, while she was yet in the cradle, he had the strongest affection; he brought her every thing, and wanted to feed and nurse her alone, and was jealous when any one took her out of the cradle, in which he was her ruler: his anger then knew no bounds; and, indeed, he was much easier brought to anger than to tears."

It is curious, too, to note how much, to use a familiar phrase, he was made of from the very beginning. Witness two slight anecdotes told by his mother of his youth:—

*The Pebbles*.—"In his dress he was most terribly particular, I was obliged to arrange three suits daily for him; upon one chair I hung a great-coat, long trousers, ordinary waistcoat, and added a pair of boots; upon a second, a dress-coat, silk stockings which he had already worn, shoes, &c. &c.; upon the third was every thing of the finest, together with sword and hair-bag: the first he wore in the house; the second, when visiting his common acquaintances; the third, as full dress. When I entered the next day, I had everything to bring to order: there stood the boots upon his fine ruffs and collars, the shoes thrown east and west, one thing lay here, the other there: then I shook the dust out of his clothes, placed clean linen for him, brought everything again into the right track. Shaking a waistcoat once at the open window rather strongly, a quantity of pebbles suddenly flew into my face: upon this I began to curse; he came up, and I scolded him, for the pebbles might have struck out my eye. 'Well,' said he, 'but your eye is not out; where are the pebbles? I must have them again, help me to look for them;—now he must have received them from his sweet-heart, for he took so much trouble about the stones, which were common flint and sand; he was so vexed, that he could not collect them any more; all that was still there, he wrapped up carefully in paper and carried away. The day before he had been at Offenbach—there was an inn called the *Rose Inn*, the daughter was called the pretty *Grizel*; he liked her very much, she was the first that I know with whom he was in love."

*The Cloak*.—"On a bright winter's day, when your mother had company, you proposed to her a drive with the strangers along the Maine. 'She has not yet seen me skate, and the weather is so fine, &c.' 'I put on my scarlet fur-cloak, to which was a long train, and down the front fastened with gold clasps, and so we drove out. My son was shooting like an arrow between the other skaters, the air had made his cheeks red, and the powder had flown out of his brown hair: as soon as he saw the scarlet cloak, he came up to the coach and smiled quite kindly at me. 'Now, what do you want?' said I. 'Come, mother, you are not cold in the carriage, give me your velvet cloak.' 'Why, you won't put it on?' 'But I will though.' I pulled off my beautiful warm cloak, he put it on, swung the train over his arm, and away he sailed like the son of a divinity along the ice;—had you but seen him, Bettine! Anything so beautiful is not to be seen again: I clapped my hands with joy! I always have him before my eyes, how he glided out of one arch and under the other, and how the wind upheld the long train behind him."

This work has been published that its profits may go towards forming a monument for Goethe; and both translation and printing have been done in Germany. There are editions

of Goethe and his mother, together with a view of the room where he wrote Werter. We doubt its ever obtaining wide circulation among ourselves; still it is worth the reading, as a wild, original, and very nationally characteristic work.

*Friendship's Offering, and Winter's Wreath: a Christmas and New Year's Present for 1838.* 18mo. pp. 384. London, Smith, Elder, and Co.

THERE is nothing very striking in the volume before us; it is graceful and level. The two best stories are by ladies—"Charlotte de Montmorenci," by Miss Strickland, and "The Blacksmith of Liege," by Miss Roberts: both are interesting and lively historical pictures. What does the editor mean by his having the good fortune to bring forward Mr. Cornelius Webbe in the character of a poet? Mr. Webbe has already published a slight volume of poems, many of which are established favourites. "The Dying Poet to his Sister" was among them; full of pathos and tenderness. We select "The Desolate Hall," by Thomas Miller, the basket-maker, for quotation.

"A lonely hall upon a lonelier moor,—  
For many a mile no other dwelling near;  
Northward an ancient wood, whose tall trees roar,  
When the loud winds their huge broad branches tear.  
A large old hall—a servant deaf and gray,  
On me in silence waits, throughout the dreary day.  
Before my threshold waves the long white grass,  
That like a living desolation stands,  
Nodding its withered head whene'er I pass,  
The last sad heir of these broad barren lands,—  
The last within the old vault to repose;  
Then its dark marble door upon our race will close.  
The whining wind sweeps o'er the matted floors,  
And makes a weary noise, a wailing moan;  
I hear all night the clap of broken doors,  
That on their rusty hinges grate and groan;  
And then loud voices seem to call behind,  
The worn and wormy wainscot flapping in the wind.  
Along the roof the dark moss thickly spreads,  
A dampness o'er the creaken rafters throwing;  
A chilly moisture settles on the beds,  
Where lichens 'mid decay are slowly growing.  
Covering the curtains, and the damask eyes  
Of angels, there enwrought in rainbow-fading dye.  
The toothless mastiff-bitch howls all night long,  
And in her kennel sleeth all the day;  
I heard the old man say, 'There's something wrong,  
She was not wont to yell, and howl that way—  
There's something wrong. Oh! ill, and wo betide  
The leech's hand by which my Lady Ellen died.'  
Sometimes I hear—or fancy—o'er my head  
A trampling noise—like that of human feet;  
In hollow high-heeled shoes they seem to tread,  
And to the sound of solemn music beat:  
Then with a crash the window-shutters close,  
Shaking the crazy walls, and breaking my repose.  
The silver-moth within the wardrobe feeds;  
The turned keys are rusted in the locks;  
Upon my hearth the brown mouse safely breeds;  
By the old fountain fearless sleeps the fox;  
The white owl in my chamber dreams all day,  
For there is no one cares to frighten him away.  
The high-piled books with cobwebs are o'ergrown,  
Their gaudy bindings now look dull and dead;  
Last night the mazy Bible tumbled down,  
And it laid open where my Ellen read.  
The night she died: I knew the place again,  
For she shed many a tear, and each had left its stain.  
Oh! how I shun the room in which she died,  
The books, the flowers, the harp she well could sound;  
The flowers are dead, the books are thrown aside,  
The harp is mute, and dust has gathered round  
Her lovely drawings—covering o'er the chair  
Where she so oft has sat, to braid her long brown hair.  
What hollow gusts through broken casements stream,  
Moving the ancient portraits on the wall!  
I see them stirring by the moon's pale beam.  
Their floating costumes seem to rise and fall;  
And as I come or go, move where I will,  
Their dull white deadly eyes, turning, pursue me still.  
And when a dreamy slumber o'er me creeps,  
The old house-clock rings out its measured sound,  
I hear a warning in the march it keeps:  
Anon the rusty vane turns round and round:  
These are sad tones, for desolation calls,  
And ruin loudly roars around my father's halls.  
The fish-ponds now are mantled o'er with green,  
The rooks have left their old ancestral trees;  
Their silent nests are all that now is seen;  
No oxen low along the winding leas;

No steed neighs out, no flocks bleat from the fold ;  
Upland, and hill, and vale, are empty, brown, and cold.  
And dance, and song, within these walls have sounded,  
And breathing music rolled in dulcet strains;  
And lovely feet have o'er these gray stones bounded,  
In snowy kirtles and embroidered trains :  
Such things have been, and now are gliding past,  
And then our race is done :—I live, and die,—the last !”

And the “Forsaken Friend,” by Miss Stickney :—

“At early morn these fragile flowers were blowing,  
All sweet and fair ;  
On the wild breeze their odorous burden throwing,  
Scenting the air.  
At early morn with buoyant step I sought thee,  
Friend of my youth !  
A blooming garland from the fields I brought thee,  
With my soul's truth.  
I knew not then thy fickle heart was altered,  
Nor read thine eye ;  
I thought the welcome of thy sweet voice faltered,  
But asked not why.  
And now I keep these fair but slighted flowers,  
Unfaded yet ;  
Have they not taught me, in a few short hours,  
How to forget ?  
There wanted but one fatal word to sever  
Our hearts in twain ;  
That word thy lips had spoken, and we never  
Can trust again.  
Thou wilt go forth on summer's fragrant morning,  
Once more to see  
Her radiant smile the purple hills adorning,  
But not with me.  
I shall be where no household memories waken  
Thoughts of the past ;  
I shall forget. The lonely and forsaken  
Forget at last.  
I shall forget thee ; many a deeper sorrow  
Has been forgot ;  
But yet I dare not look into the morrow  
Where thou art not.  
I dare not think how oft my fond heart's yearning  
Will wake again ;  
How I shall watch to see thy smile returning,  
And watch in vain ;  
For thou couldst teach what nothing else had taught me  
From early youth ;  
Not all the wisdom of the world had brought me  
So deep a truth :—  
That human love, however pure its fountain,  
May waste away,  
Like the fresh dew upon the verdant mountain,  
At dawn of day :—  
That this fair earth, with all its gorgeous beauty,  
Its fruits and flowers,  
Forms not the scope of human love or duty,  
Though once of ours.”

We regret that we have not space for either of the spirited stories contributed by “the Old Sailor.”

*Wanderings and Excursions in South Wales ; including the Scenery of the River Wye.* By Thomas Roscoe, Esq. 8vo. pp. 268. London, 1837. Tilt.

THIS picturesque and beautiful publication has been repeatedly noticed by us in the course of its progress. It is now completed ; forms a remarkably handsome volume ; illustrated by forty-eight admirable engravings by Radclyffe, from drawings by Cox, Harding, Fielding, Cresswick, Watson, &c. ; and is an appropriate companion to the similar work on North Wales, by the same author. We have heretofore made several quotations from the text : the following description of a land-storm will afford an additional proof of Mr. Roscoe's descriptive powers :

“Craig-y-Dinas rises at a short distance from Pont Neath Vaughan to the north-eastward ; and is a bold precipitous limestone rock of great elevation, backed by the still higher land of Cilhepate-cerig. From the summit of this lofty crag I enjoyed a splendid prospect, looking down the lovely vale of Neath ; comprehending, in the nearer view to the right and left, the wooded mountain hollows of Cwm Melte and Cwm Carngrist, sleeping in their solitary rock-environed retreats. Immediately below me flowed the small streamlet of the Sychrhid, or

dry ford, as it is sometimes termed, which, for a short space, divides the counties of Brecknock and Glamorgan, and hurries by the foot of Craig-y-Dinas to join the Melte. Eventide was now slowly approaching, and the distant prospects had already become dim and obscure, when I retraced my steps towards Pont Neath Vaughan. I lingered not to catch the little vignettes of natural beauty which every outlet offered to my sight ; for the shadowy clouds, which had been chasing each other with rapid motion through the day, were gathering into broader masses. One cloud, of a more ominous character than the rest, had for some time hung its dark shroud in the north-east, on the top of the lofty Cefn Cadlan. The wind sighed long and heavily through the mountain chasm, or swept in fitful gusts along the high ridges and openings. Before I reached my home at the little inn, however, it had dropped into a treacherous calm. I was almost repining at the unnecessary haste with which I had quitted my prospect-ground on the hill, and abruptly interrupted that calm train of thought which takes possession of the mind as the fading landscape becomes less and less, when I was startled by the flickering, restless motion of the leaves, which indicated that secret agitation of the air that almost always precedes a storm. The dark cloud of the Cefn Cadlan, which had been for some time stationary, appeared to be disrupted from its pinnacle, and rolling its surcharged body rapidly towards the village. I had scarcely entered, and bespoke the attentions of mine host to supply the wants which my long walk had created, when the elemental strife began :—the thunder, which had sounded at a distance, approached fearfully near— it no longer maintained that majestic roll which fills the mind with awe and reverence, but burst with a crackling explosion, that, by its proximity, inspired terror and alarm. The forked lightnings quivered in the welkin with awful velocity, and in almost unremitting succession, and seemed to light up all Nature with an unearthly and spectral glow by its ‘sulph’rous and thought-executing fires.’ The wind, which at the commencement of the storm had been uncertain and gusty, now increased to a wild hurricane ; and the rain, which had only before fallen in large single drops, soon descended in torrents.

‘ Since I was man,  
Such sheets of fire, such bursts of horrid thunder,  
Such groans of roaring wind and rain, I never  
Remember to have heard.’

It was some time before the storm abated, and then only gradually ; at length, the wind, which before had swept along with such reckless fury, sighed itself, like a fretful and worn-out child, to rest. The thunder, ‘Heaven's artillery,’ ceased to roar, and was only heard reverberating amongst the hills, awakening their distant echoes. The lightning, no longer darting with a scorpion tongue, through the wide air, gently played, as if in sport, over the loftiest pinnacles of Bryndu, or along the enormous ridge of Y Fan Dringarth : the huge drops of torrent-rain, that had been falling like a deluge, subsided into a gentle refreshing shower. The tempest had continued so long, that it was near midnight ere I retired to rest : I threw open the casement of my window to enjoy for a moment the calm, clear scene, that had succeeded to the tumultuous storm. The stars shone with a brightness and intensity which is only to be observed in these altitudes ; the clouds lay in fleecy brightness, ‘like a flock at rest,’ or, if they gently moved, and obscured for a while the moon's quiet saintly face, it

was only to part again before her renewed splendours,

‘ As though a silv'ry veil were rent  
From the jewell'd brow of a queen.’

A gentle, settled, and holy stillness seemed to rest on all the face of Nature ; and I closed my window, to seek, with a deeply touched heart, the tranquil slumbers of my humble pallet.”

#### MISCELLANEOUS.

*The Christian Keepsake, and Missionary Annual, for 1838.* Edited by the Rev. William Ellis. 8vo. pp. 206. London, Paris, and New York, Fisher and Co.

THIS elegant volume continues to be well adapted to the class of readers to whom it is addressed. What we like least is the memoir of Mrs. Fletcher ; it is rapid, without the true comprehension of the character it delineates : still we cordially agree with the praise. There is some graceful poetry ; among which we must particularise that of James Montgomery.

*Fisher's Juvenile Scrap-Book, 1838.* By Agnes Strickland and Bernard Barton. 8vo. pp. 86. London, Paris, and New York, Fisher and Co.

THIS is the prettiest annual for the use of young people that we have seen ; and the literary contents are of an unusually high character. “The Captive Princess” is a charming poem.

*The English Annual, for 1838.* 8vo. pp. 360. London, Churton.

THIS is only a reprint of the “Court Magazine ;” and, excepting a very handsome binding, has nothing that calls for notice.

*Naturalist's Library. Vol. VIII.* Conducted by Sir W. Jardine. Ornithology : Birds of Western Africa. By W. Swainson. Edinburgh, 1837. W. Lizars.

ANOTHER beautiful volume of a beautiful series. The engravings are quite splendid ; such birds more than realise Moore's description of the bright wings that

“Fluttered round the sunny stems  
Like winged flowers, and flying gems.”

Mr. Swainson has added all that scientific research could give of information, and a well-written memoir of La Vaillant.

*The Life and Reign of William IV.* By the Rev. G. N. Wright, M.A. 2 vols. 8vo. London, 1837. Fisher and Co.

A VERY opportune and useful performance ; collecting all the important events of the late reign, and enlivening them with a great collection of anecdote. The present work is one required at the moment, and yet valuable hereafter as embodying that immediate detail which would otherwise be lost, and which is so valuable to the future historian. Mr. Wright is very loyal, and a little grandiloquent ; but we give him credit for not omitting anything that would bear upon his subject. One very attractive feature in these volumes, is the numerous likenesses with which they are embellished ; they contain a complete portrait-gallery of the royal and distinguished personages of our time, also a very graceful engraving of the Queen Victoria. The work is elegantly got up, and does credit to the taste and activity of its publishers.

*Kirkstead ; or, the Pleasures of Shooting : a Poem.* Pp. 56. (London, Painter.)—We have not examined far into the merits of this little book, as it is intended for a charitable purpose, and disarms criticism. It is dedicated “to the Ladies patronesses of the Fancy Fair, to be held in aid of the Lincoln County Hospital,” at which it is to be sold, and the profits arising from its sale are to be devoted to the funds of the above-named charity.

*Memorietta Italiana a l'usage des Jeunes Demeuilles*, par Madame A. Cassella. (Londres, Souter.)—A neat and useful selection of dialogue well calculated to be useful to the young Italian scholar.

*A Letter to the Right Hon. T. S. Rice, &c. containing a New Principle of Currency and Plan for a National System of Banking*, by a Liverpool Merchant. Pp. 28. (London, Wilson.)—The writer, Mr. John Hall, takes a clear and able view of what he deems the great errors in the Bank of England; those of considering the deposits as if they were bank notes and in circulation; and the principle of diminishing notes in equal, instead of relative proportion to the diminution of bullion, after the standard of full currency is departed from. Upon these and other very important points, his remarks are extremely interesting; and, together with the system by which he proposes to remedy the evils demonstrated, and such fatal attacks as lately fell upon our commercial credit in consequence of the operations of the Bank to bring back some of its bullion, embrace matters of vital consequence to the country, its trade, and manufactures.

*A Traveller's Thoughts*. 2d edition. 12mo. pp. 100. (London, Longman and Co.)—One of the many descriptive poems to which "Childe Harold" has given birth; the versification is smooth and flowing.

*The Tour of Sir Godfrey Doodle Doo*, by an Oxford Man. 8vo. (London, Hurst and Co.)—Printing and publishing are wonderful things, but their greatest wonder is, how they could ever have been bestowed on such utter trash.

*Stilling's Tales*. Translated from the German by S. Jackson. 12mo. pp. 194. (London, Hamilton, Adams, and Co.)—Simple and interesting stories, but not translated with much judgment: a little omission would have made them more suitable to the class of juvenile readers for whom they are intended.

*Bethlehem, a Poem*, by W. Benett. 2d edition, 8vo. pp. 47. (London, Rivington.)—Some graceful versification, and an elevated tone of piety, will recommend this volume to the religious public.

*Cicero, a Tragedy*. 12mo. pp. 140. (London, Henshaw.)—It ought rather to be called a farce.

*Bolton's Linguist: a complete Course of Instruction in the German Language*. (London, Wacey.)—This is an excellent work, and we most cordially commend it to the student of that important language, German.

*Questions on the History of Europe: a Sequel to Miss Mangnall's Historical Questions*, by Julia Corner. 12mo. pp. 404. (London, Longman and Co.)—The value of Miss Mangnall's elementary works is universally acknowledged, and we cannot give the present neat and useful volume higher praise, than to say, that Miss Corner is a worthy successor. An immense quantity of information is condensed in these pages.

*Kingly Vale and other Poems*, by C. Crocker. 12mo. pp. 88. (Chichester, Mason.)—A love for the beauties of nature is shewn in this slight volume; and criticism would be an unnecessary harshness after so modest and deprecating a preface.

*The Two Brothers*. 12mo. pp. 90. (London, Groombridge; Edinburgh, Sutherland; Dublin, Robertson and Co.)—A well-meant fiction, but deficient in narrative talent.

*Sketches of English History*, by G. M. Gilbert. (London, Darton and Clark.)—We do not see the advantage of crowding children's memory with names and dates; now, this little volume does nothing more. The estimates of character too, are singularly mistaken: what does the writer mean by calling Elizabeth "amiable"? It is about the last qualification that would have been assigned to "the lion-hearted princess."

*A few Arguments against Phrenology*, by A. R. Smith. 12mo. pp. 26. (Chertsey, Wetton.)—"Who shall decide when doctors disagree?" We certainly will not attempt it; and shall only say, that the present writer is very much in earnest.

*Lectures on Entomology*, by John Barlow Burton. 8vo. pp. 48. (London, Simpkin and Marshall.)—A great deal of information very pleasantly conveyed. The contents of this prettily illustrated volume will give interest to many a summer walk; and the lovers of this interesting science owe much to Mr. Burton's intelligent and agreeable lectures.

*The Prayer of a Solitaire for her Most Gracious Majesty, Queen Victoria*, by L. H. R. Contier, author of "Hours of Reverie." Pp. 26. (London, Whittaker.)—A graceful production, written with much sweetness and truth; and interesting, as the expression of general feeling, to its illustrious object.

*Gods of Homer and Virgil: or, Mythology for Children*. Pp. 210. (London, Thomas; Simpkin and Marshall.)—A beautiful little volume, well adapted to its purpose, and giving the youthful reader an excellent introduction to "the throng'd divinities of old Olympus."

*The New Excitement*. 18mo. pp. 34. (Edinburgh, Innes; London, Hamilton, Adams, and Co.)—A pleasant selection of miscellaneous reading. It is neatly got up, and likely to give the juvenile public, for whose use it is especially compiled, many an agreeable hour. *The New Excitement* proceeds on the old principle, that "much would have more;" and the taste for reading once given, the most important step in education has been obtained.

*Letters to Brother John on Life, Health, and Disease*, by Edward Johnson, Surgeon. 8vo. pp. 312. (London, Saunders and Otley.)—There is not only medical knowledge, but a great deal of plain and excellent sense, in those pages. To read one of these letters every morning would be a good way of beginning the day. Half our illnesses originate in bad habits and indulgence. Want of knowledge is the source of half the evils that vex humanity; and, in this work, much plain and practical in-

formation is communicated; and in a manner to make it available to the general reader. Mr. Johnson is, as his work plainly shews, a straightforward and clever practitioner. We have great faith in him.

## ORIGINAL CORRESPONDENCE.

### EUPHRATES EXPEDITION.

*Copy of Instructions to Colonel Chesney, &c.*  
[Second notice.]

The history of this interesting and truly national expedition, as detailed in our last, affords much matter for reflection. With all the feeling that was individually shewn for the sufferings and misfortunes of those engaged in it, there was an apathy and an indifference towards the success of the objects of the enterprise, that is quite inconceivable, and certainly unprecedented. In vain do we look over the correspondence now before us, for a single word of encouragement—a sympathy, not for misfortune, but for hope and success; it is not to be met with. Lord Ellenborough writes, "get down to Basra and we have done with you." And Sir John Hobhouse seems always to have considered the expedition as a most unpopular one,—one for which, notwithstanding the unforeseen events which had led to an expenditure exceeding the original grant, nothing could be said in favour, or in support of, before a certainly not hostile house. It did, however, meet with some encouragement; a further grant was made; and after being ordered to terminate on the 31st of July, 1836, the breaking up was postponed until January 31st, 1837; a term which, notwithstanding the real and unaffected interest of his late majesty, and the friendly expressions of the present President of the Board of Control, was closely adhered to; and at the appointed period, the expedition was broken up, without any reference to the then existing condition of the steamer, the efficacy of the crew, the state of the water, the torpor or activity of the parties engaged, or even the giving to the commander the chance of redeeming his misfortunes by an ultimate success.

Whether these adverse circumstances under which the expedition laboured from the outset, were attributable to the public feeling not being sufficiently roused in its favour, or to the lack of support on the part of government, combined with the partial failure of the expedition, is a questionable matter. We do not think that the means for publicity, which would have done bare justice to the expedition, were duly taken advantage of. We do not allude to the mere blast of an anticipatory trumpet to awaken the public mind to scenes of oriental enterprise and discoveries in relief: we mean that when the expedition was labouring daily and hourly, one party toiling at the transport of boilers and sections of steamers—officers with jack-screws in their unaccustomed hands—engineers with pickaxes, hewing a new road to Antioch—and seamen spurred and booted, impelling Taurian mules to their duty; while others were ascending mountains, exploring antique sites, and mapping the countries around—that some idea of these labours, such, for example, as is contained in the general statement appended to the present report, should have been from time to time laid before the public; and it is impossible, we aver, that any well-informed person could have regretted the mite that it would have cost, to have continued and to have completed a work which cannot but redound so much to the credit of the country, by the additions which it brings to geographical, to natural, and to historical science.

It is needless to connect ministers or parties with the cause of failure: one great and solid advantage which the expedition ever enjoyed

was, that it had no politics nor clique. Its objects were the opening of a new route—labour, enterprise, and science; its materials were most varied, and party feeling unknown from the commencement to the termination.\* Ministers are influenced by the feeling of the majority in the House of Commons; and that majority is to be gained, like a preponderating feeling in the country at large, by an early dissemination of accurate information, as to what is being accomplished, and how far an expedition is worthy of the confidence reposed in its commanders. But no such steps were taken: it is only now that the thing has been brought to a close, that we are made aware of the vast mass of matter which has been accumulated, of the opening that is offered by these countries to commerce, of the friendly disposition of the often calumniated Arabs; and we live to regret that, if the line was to be abandoned ultimately, the whole of the antique geography of these interesting countries was not completed. Has Susa, where Daniel lies entombed, where Alexander held his last festivities, by which flows

"Choesper' amber stream,  
The drink of none but kings,"

no interest but to the learned? yet its position, and that of the Ulai of Scriptures, is scarcely determined. Where is Terebinth, Nebuchadnezzar's colony, when the Chaldeans "took pride in their ships," trading from the Persian Gulf to Phœnicia? where the giant Pallacopas, to which Alexander dug a channel, and which, with the Nahr Malka, the royal river, bearing ships in the days of Herodotus, drained the Euphrates of its superabundant flood? And when imagination turns to the vast plains contiguous to these canals, with what interest does it ask for information on those colossal mounds which rise out of the level, or tower above the horizon:

"Chaldean beacons, over the drear sand  
Seen faintly, from thick-towered Babylon,  
Against the sunset."

The very marshes, Arrian tells us, where the Macedonian hero was led astray, were dotted with monumental remains; and where, in the present day, is Erech or Accad? where Borsippa, "the city of manufactures?" Opis, that succeeded to Babylon? Charax, once but a mile from the sea? Are they marked by the same bold monuments of a laborious and an aspiring people, or are they level with the dust? What line did that earliest of enterprising navigators, Nearchus, follow? Where the Susian, and where the Chaldean lakes? And what has been the rate of advance of the alluviums upon the sea?

The banks of the river Euphrates, and those of the Tigris, teem with objects of the deepest interest to the naturalist or the antiquarian. Alexander, Trajan, and Julian have stood by the fountain of Hit, whose inexhaustible supplies of bitumen cemented the walls of the "mother of cities." The tasteful Zenobia has left a record of her magnificence in the marble walls and houses of Zelebi. Haroun al Raschid's palace stoops low at Racca. The temple of Atergatis, plundered by Crassus, still stands, like an antique Egyptian monument in Hierapolis—the Magog of the Syrians. Neither Sura nor Cersium were always limitrophal of Roman dominion; and at every step, records

\* The unanimity which pervaded this expedition was, perhaps, one of its most remarkable features. We have heard that, on board the Euphrates, a cross word was unheard to the last moment. Well may Colonel Chesney speak in such high terms of officers whose services, like his own, have as yet met with no requital, save that most honourable one, his late majesty's unfeigned approval of their conduct.

of Greek, of Roman, of Jewish, of Sassanian and Parthian, or of Mahomedan industry, shew themselves; while every here and there, at Rehoboth, at Calne, at Nimrood, at Nineveh, at Acca-Kuf, and throughout the alluvial plain, more ancient relics attest an Assyrian or a Babylonian origin.

It is impossible to conceive, we have heard from one well capable of giving an opinion upon the subject, the inaccuracy of the most recent maps even of Syria: as to the Euphrates and the Tigris, nothing had been done, except Colonel Chesney's sketch. Is it not, then, a source of congratulation, that we have now in store a historical and geographical map of these first homes of our progenitors, and even plans of the cities of the early races of mankind?

Comparisons are invidious; but what did the exploration of the icy and snow-clad regions of the north offer to the pleasures of knowledge, compared with the rivers of Western Asia? yet how different the support given to the two enterprises! Worse—what was the difference in point of utility and of commercial advantages?

It has been argued by some, that it was shewing the way to a northern potentate—as if that country of schools and academies was ignorant of the existence of the Euphrates! And, indeed, if so, was it not best to be there first? but, if there once, is it not still more imperative that we should retain the position gained, nor retrace, in gloomy, unhoping thriftiness, and political supineness, the step that has been taken in a moment of intellectual boldness and honourable patriotic pride? Is Britain so sunk to all sense of her own dignity, and to all outward manifestation of her greatness, that, for a few thousand pounds, she will forego the advantages that 35,000*l.* and many lives have acquired for her?—a peaceful footing with four millions of tribes, the Havelites and Edomites of antiquity; the untutored, unfostered, but not irreclaimable, Arabs of the present day? This we know will not be. When Rome, occupied with domestic broils, neglected its foreign power, Rome was already in her decadence.

We do not intend to discuss the question of the Red Sea, compared with the Euphrates, more particularly as Colonel Chesney is in favour of both lines being opened; but necessity, entailed by the progress of steam navigation and modern enlightenment, has rendered imperative a different system of communication with our Indian possessions. And certainly the most strenuous advocates of the Red Sea line have never shown any of the commercial and political advantages which are held out by the Tigris and the Euphrates, nor has the former line yet been proved to be available all the year; while it appears to be the opinion of all the officers, separately and independently communicated, that the Euphrates is an eminently navigable river, although, after the loss of the Tigris, the remaining steamer was not well adapted for overcoming the difficulties presented by the low season—nor is she the kind of vessel recommended, except for the lower part of the river. The question had been at first to construct boats, which should carry several days' provision of coal, as it was not thought that the Arabs could be depended upon; and this necessitated size, and a considerable draught of water: but now that it has been ascertained that depôts of wood, bitumen, or coal, may be formed at any point, steamers may be constructed to draw the smallest quantity of water possible; and the expense of such is alone necessary to make this noble river the scene of

active commerce and communication, and the seat of new communities of men. An experimental navigation can at the best only shew how the ultimate advantages are to be reaped, and this appears to us to have been fully accomplished.

Without alluding to the land routes, as proposed by Colonel Chesney, and which present so few commercial advantages, it appears that the line by Suez and the Red Sea demands a period of 53½ days for the outward passage, and 55½ for the homeward; while by the Euphrates it is only 46 days outward, and 52 homeward-bound. But what is more important, the first will require for its maintenance, a loss of not less than 30,000*l.*; while on the Euphrates, the loss, with twelve voyages a-year, would only be about 11,000*l.*, including, in both cases, the Mediterranean.

These are subjects, we again say, well worthy of reflection; the advantages which are presented by the opening of the navigation of the river Euphrates, belong to universal civilization, as well as to an increase of national power; and we are sure that none will feel but that the most prudent economy ought not to have interfered with, nor ought in future to lie in the way of the accomplishment of an object of such real interest and importance, both to ourselves as a nation, and to our possessions in the East.

#### ARTS AND SCIENCES.

##### IMPROVEMENTS: THE HIGHLANDS, IRELAND, &c.: COMPRESSION OF PEAT.

SEVERAL of our Numbers have recently adverted to practical improvements of much commercial and agricultural interest. The expedition of steam, in its appliances by land and sea, is ever opening new ways and means to wealth; a slight scientific discovery shews how readily natural productions may be transported, in perfection, from one end of the earth to another, and countries clothed with additional beauty and fertility; well-conducted experiments teach how to impart facility and safety to the port, or how to form the very wave, and ride it triumphantly with sail and merchandise;\* and other carefully calculated operations in farming demonstrate that the waste may be reclaimed with advantage, and the most useless soil be forced to contribute bountifully to the wants of man. In this latter instance, we allude to the reclamation of peat-bog in Ireland by Lord Clonbrock, confirmed and corroborated by the testimony of the several individuals who had enjoyed opportunities of trying or witnessing similar labours.

The subject is, however, more especially pressed upon our notice by the Session of the Highland Society, at Dumfries, and the various suggestions and examples for improving the country to which it tends. Among these, it has been our good fortune to be eye-witness to a very simple, but, in our opinion, immeasurably important work, which, in an earlier stage (about a year ago), was described in our columns—we refer to the compression of peat or turf, so as to render it nearly, if not quite, equal to coal, not only for domestic consumption, but for mechanical and manufacturing purposes. We are indebted to Lord Willoughby d'Eresby for persevering through them all till he has conquered the difficulties opposed to this task, and finally and fully accomplished the object at which he aimed. In the first place, the fabrication of a machine to perform the

operation was no slight obstacle, for its requisites were cheapness, ease in working, and efficiency. The two former being overcome, the latter demanded much ingenuity to discharge the moisture freely, and yet retain every particle of the combustible material. By simplifying the press, increasing its power, and wrapping the masses of peat in coarse linen, the consummation has been arrived at; and, a few days ago, we saw the wet and ragged turf, both of the surface and lower stratum, condensed in a few seconds to the hard, nearly dry, and shapely dimensions of a convenient article for firing. This sample was sent to the Highland Society; but we speak from our own observation of the process. From the first weight of eight pounds it was reduced to about 5½ lbs., by the discharge of 2½ lbs. of almost pure water, or 30 per cent. In bulk the reduction was nearly one half; and, when dropped from the press, there was a firm and compact body, fit, as we have said, for every economical and useful purpose.

It will be allowed that we do not over-rate the importance of this fact, when the circumstances attached to it are taken into account. 1st. In immense tracts of boggy country, where there is no other fuel, the very necessities of life are supplied by the common cutting of turf, and casting and drying of peat, which, after all, make but an indifferent fire. Yet it costs the labourer and his family much toil and much time. The original preparation is little to the long journeys, week after week, and in a changeable climate, to turn and sort the peats, so as to get them dry enough to burn—a desideratum not always achieved. Now, with Lord Willoughby's invention, the cotter and his family may make plenty of excellent firing, not only for their own consumption, but for sale to neighbours otherwise employed; and this of an infinitely superior material. It surely is not imaginative to foresee, from the single piece of substance now before our eyes, the capability of immense effects. Instead of the bare and imperfect supply of the absolute want for subsistence, we have that which is better, cheaper, more easily, and more abundantly made. We have a fuel which can be applied to every agricultural and manufacturing purpose; to the burning of lime, the smelting of iron, the propagation of steam; in short, to every thing which can ameliorate the condition of a population, and plant industry and activity where only idleness and wretchedness prevail. In the midst of the wild moor, the factory, with its engines and machinery, may raise its head; whilst the earth around is forced to assume the healthy forms of cultivation and productiveness. If we look at Ireland, the consequences cannot be calculated. The north of Scotland, too, offers a grand field for this improvement. In truth, it is altogether one of those happy inventions which need only to be followed up with alacrity and spirit to

"Scatter blessings o'er a smiling land."

#### BOTANICAL SOCIETY.

THURSDAY, October 5th, Mr. Reynolds in the chair.—After the announcement of presents of books and collections of plants, Mr. Freeman submitted to the society, a list of *Flora* observed and collected by him in the neighbourhood of Stratford, in Essex; and remarked briefly upon the importance of ascertaining the various species of different localities, as data for the establishment of geographical laws. A similar paper by Mr. Wallace, with judicious and interesting observations on the striking peculiarities of plants found near

\* Refer to Reports of the British Association, and particularly to the papers on Steam Navigation, Mr. Ward's experiments on plants under glass, and Captain Denham's and Mr. Russell's communications.

Chelmsford, was read by the secretary; who, also, read extracts, translated from the work of M. Alphonse de Candolle, on the geographical distribution of alimentary plants. Barley (*hordeum vulgare*) is cultivated furthest north, in the Orcades and Shetland Isles (61° lat. N.), and even in the Isles of Ferøe (61° to 62½°). Iceland (63½° to 66°) is deprived of it, although its industrious inhabitants have made every effort to acquire some species of cereal plant. In Lapland, its northern limit is about 70°. In Russia, barley grows between 67° and 68°, on the western side, and about 66° on the eastern. In Siberia, between 58° and 59°. Such is the sinuous curve which limits the cultivation of barley; and, consequently of the cereals. This line is the boundary of agriculture, beyond which, with the exception of a narrow, undefined line, in which certain edible lichens are procured, and where potatoes have been recently introduced, man lives upon animal products alone. As the line, beyond which barley cannot be cultivated, is so serpentine, circumstances, purely physical, must oppose the insurmountable barrier. The temperature of the seasons supplies the cause; for a certain degree of heat is evidently the physical condition of which the northern regions are deprived. A mean summer temperature of 8° centigrade is necessary for its perfection: this is proved by following the curve indicated. The Ferøe Isles have a mean temperature of the year centigrade, +7·3; of the winter, +3·9; of the summer, +10·16. Lapland corresponding temperatures, +1·0, -6·0, and +8·0; Russia, 0, -12 to 13·0, and +8·0. In the interior of America and Siberia, the limit of its possible culture is so little known, that it is better to abstain from a comparison. The lat., 58° and 59°, given for Siberia, may, probably, be advanced to the north. A mean temperature of 8° during the summer is the only indispensable condition for its cultivation. Iceland, where the cereals are not granaried, possesses a mean summer temperature of +9·7; the tempestuous rains alone prevent their growth. A map, drawn by the secretary, shewing the isothermal, isochimnal, and isothermal lines, also the limits of the various alimentary plants, rice, maize, &c., was laid upon the table. Wheat was similarly treated of. The extracts from this interesting work will be concluded at the next meeting; when, also, a paper will be read by Dr. Boessey, on the plants which have been observed to produce the ergot. Members were requested to send in such duplicates of plants as they could spare for the Society as early as possible. The meeting then adjourned to November 2d.

## ELECTRICAL SOCIETY.

SATURDAY, OCT. 7th.—The first weekly meeting of the season was held in the theatre of the Adelaide Street Gallery, liberally granted by the council of that institution for the future meetings of the Society. Mr. Bradley exhibited a new thermo-electric apparatus, consisting of fifty-six pairs of elements, imbedded in plaster of Paris, in order, if possible, to prevent voltaic action, it being a disputed point, whether thermo-electricity be due to that agent partially, or entirely to caloric. The report of the committee was read by the assistant secretary; also, an address by Mr. Sturgeon, in which he explained the nature and objects of the Society, and advocated its cause from a full conviction that the cultivation of electricity will ultimately confer the most important benefits on mankind; and that a co-operation of experimentalists would render its data more numerous and exact than could be attained by the insu-

lated position in which they have hitherto been permitted to labour. The thanks of the meeting were voted to Mr. Sturgeon; also to the managing committee and secretary. Several new members were announced.

## ENTOMOLOGICAL SOCIETY.

OCTOBER 2d. J. F. Stephens, Esq. president, in the chair.—The minutes of the last meeting having been confirmed, and other ordinary business transacted, numerous donations of entomological works from various foreign societies and naturalists were announced. Mr. Saunders exhibited a small but interesting collection of specimens from Central India; and Mr. Westwood, specimens of the grub which at the present time is committing serious injury on the turnips in the inland counties. He also presented specimens of two small insects, *Apion radiolus*, and *Hallica fuscipes*, ordinarily found upon the *Malva sylvestris*, but which he had noticed to be very injurious to the holly-hock. The same member also presented highly magnified drawings of the appearance of the secretion emitted by the domestic fly, produced by a disease which causes its death, and which has been considered a kind of plethora by Mr. Kirby, but which Mr. Macleay, at the Liverpool meeting, had regarded as a parasitic fungus. The memoirs read, were, 1. Notes upon the black caterpillar of the turnips, communicated by Mr. Sells, with additional observations by the latter; 2. Observations upon the hemipterous genus *Syritys* of Fabricius, with a monograph of the genus *Macrocephalus*, by J. O. Westwood; 3. Observations upon the natural history of several species of *Estrida*, found in the bodies of horses, by Mr. Sells.

## MARYLEBONE INSTITUTION.

A SECOND lecture, 'Upon the Science of Animal Organisation' was delivered on Monday evening, by Dr. Brewer, in which muscular structure and action were the sole topics considered. In alluding to the importance of this study, the doctor impressed upon his hearers, that the muscles must be considered not only as the frame-work, or skeleton of the animal, but the active agents in the most important actions of the organic system, viz. in circulation, respiration, digestion, &c. The structure of the muscles was then explained; and the theories of the method of their nutrition were considered at considerable length. In describing the muscles, the doctor adopted the plan of Bichat, who divides them into muscles of organic life, and muscles of animal life; the former being the involuntary, and the latter the voluntary, or muscles of relation. The functions, circulation, respiration, and digestion, were dilated on, and the lecture concluded with a review of the various theories of the nature of organic life.

## THE BRITISH ASSOCIATION.

## SEVENTH MEETING: LIVERPOOL.

[Fifth notice.]

On Friday, though the last day, there was still a superabundance of matter to engross all the Sections, and they all assembled at their posts with their wonted alacrity. The punctuality of the morning meetings was a good deal promoted by there being a public breakfast daily in the large room of the Adelphi Hotel, where, from nine till half-past ten, a capital breakfast was provided, and the members, without trouble or inconvenience, prepared themselves for the business before them.

## SECTION A.

Mr. Lubbock brought under the consideration of the Section a theory of M. Poisson,

'On the Constitution of the Atmosphere' (published in a French philosophical periodical), and which he submitted as the ideas of that distinguished individual—not as emanating from himself. The theory seems to be absurd enough; since, if true, we should all be living, as it were, under a crust of thin ice, like a glass-case, round the world, at a certain height in the atmosphere: it being laid down that the air is an elastic fluid, and that a vacuum of 100,000 cubic inches would be filled by one inch, if introduced into that void space. But as the air becomes more cold as we ascend, to what extent does it continue elastic? M. Poisson says, that it is impossible that it, or any other fluid, can be terminated by a surface of its own nature. He considers it, therefore, to be divided into three layers, the centre one being kept in its place by the different pressures of the other two, above and below. The air above, he thinks, loses its elasticity, and becomes a fluid: if so, it might become a solid; and if we admitted the reasoning of the air being bounded by something differing in its mechanical constitution, we could not avoid the idea of an external surface of ice, having the properties of reflecting ice. If the surface were such as to reflect like a mirror, we might expect to see objects reflected, mountains, &c. An individual in a balloon might see a reflection of a mock sun above the real sun. But if that had never been seen, it would do away with the idea. Some other optical consequences were mentioned by Mr. Lubbock, in further support of this hypothesis; and especially that of a sunset behind Mont Blanc being seen a few seconds after the disappearance of the luminary, reflected at a given angle from a superior point in the atmosphere.

Sir D. Brewster saw several objections, fatal to the theory, in the laws of reflection; and observed that even if he (M. Poisson) escaped reflection, he did not see how he was to escape refraction. The earth's refraction is small; this would require it to be ten or fifteen times greater. He considered the theory altogether untenable.

Professor Stevelly thought there were great difficulties in it. There was demonstration against the particles of the atmosphere being unlimitedly small, which this theory seemed to uphold.

Mr. Lubbock did not think these points had escaped M. Poisson: but, finally, he, as well as the other members who took part in the discussion, seemed to think Sir D. Brewster's reasoning conclusive.

Professor Phillips then read a Report from the committee, appointed last year, 'On Subterranean Temperature.' The meteorological committee had granted 100l. to institute experiments, and collect data, on the state of the earth near the surface, and also on the condition of the atmosphere. One moiety of the money only had been spent on the first object, subterranean temperature. They had given out 72 thermometers, with tables of registry to be filled up. No general statement was yet ready. It had been found that the variation of the sun's influence was not beyond a certain depth, where it was uniform; but that it augmented in some places, and in various geological strata at very different rates, more than others. At a colliery at Wigan, the surface temperature being 50°, 50 yards deep, the temperature was constant 53°; at 150 yards, temperature constant 56½°; at 250 yards, 63°; it being remarkable that 100 yards augmented 6½°, and about 1° for 16 yards in descent; while in France it was 1° for 15 yards. The Professor was authorised to say that the committee

would supply thermometers and registries to gentlemen connected with collieries. In some cases it was observed that the vicinity of water caused various results, and that different rocks were found to contain different conducting powers. It was mentioned, among other curious results, it might be twelve months before the sun's heat reached the depth of 26 feet. The learned Professor also stated that Professor Forbes had sunk thermometers in different places near Edinburgh, from February to September this year, and the variations were very great, but corresponded with similar observations at Brussels. Several excellent suggestions were thrown out; and the question between granite and superincumbent slate, in allowing moisture and heat to penetrate, was ingeniously treated, though with considerable differences of opinion.

Major Sabine reported the progress which had been made towards the completion of a Report on the Magnetical Lines of Dip and Intensity in England, similar to the report on the lines in Ireland, contained in the volume of the reports of the Association in 1835, and to that on the lines in Scotland, contained in the volume for 1836. The observations on the lines in England are already made in the portions of England undertaken by Professors Lloyd and Phillips, and by Mr. Fox. There yet remained some stations in the portions undertaken by Captain Ross and himself, which would be visited as soon as the present meeting was closed. The gentlemen who were thus engaged in this inquiry were desirous that their observations should be combined and form a single memoir, which Major Sabine had been requested to draw up; in which memoir it was also designed to review the determinations in Ireland and Scotland, considered in conjunction with those of England—to combine them together as parts of one magnetical survey—and to connect the British lines with corresponding determinations in the neighbouring parts of the continent of Europe, as far as the observations hitherto made on the continent will enable this to be done. Major Sabine reported that the observations to be included in this report were at this moment much further advanced, than was the case with the observations either of the Irish or the Scotch reports, at those meetings of the Association which respectively sanctioned their publication: and he engaged that, should it be the pleasure of the Association to sanction the printing of the report now in progress in the volume of the publications of the Association for 1837, it should be ready by the time the general secretary would require it for the press.

Dr. Robinson read an interesting paper, 'On the Parallax of  $\alpha$  Lyrae,' in which he shewed that the observations of Dr. Brinkley, which had, twenty years ago, given a parallax of  $1''$  to that star, had been differed from by the Greenwich observations; and that his own observations had also given contradictory results, varying from a mean of  $-1.28''$  in 78 observations, to  $+0.20''$  in 70 others; hence he considered the subject (one of the most important as regards our system) to be still open to astronomers. Sir W. Hamilton bore testimony of the consistency of the circle at Dublin.

Professor Powell read a short paper 'On the Radiation of Heat;' and Mr. Mackie a long one, 'On the Tides of Glasgow and Dundee.' He observed that we cannot implicitly rely on the time of high water to within half an hour, and shewed that, in the 16th century, the Clyde was so interrupted by shoals, &c., that there was water for only very small vessels.

The increase in 80 years has been from 4 to 16 feet in the height of the water at Glasgow Bridge, owing to improvements in the river.

Sir W. Hamilton then addressed the section 'On a New Application of the Calculus of Principal Relations,' a highly abstract mathematical question, and such as not one among ten thousand readers would understand, were we to attempt a report of it.

Mr. Ettrick presented a beautiful Instrument to demonstrate the Velocity of Electricity; which he conceived that he had proved to travel at the rate of 118,797 miles per second; but whether it travel at this speed, at 200,000 miles per second, as shewn, or thought to be shewn, fifty years ago (not forgetting the demonstration that it could beat the mail-coach hollow!), or at some other ratio, only inferior, in aught we know, in nature, to light, remains yet to be seen; and we hope much from the ingenious experiments of a Wheatstone (when ripe enough to be given to the world), and the masterly researches of a Faraday.

Professor Christie closed the session by remarks, 'On a Peculiar Phenomenon seen at Sunset in the Isle of Wight,' being, just after sunset, a ray of the same magnitude as the sun's diameter rising vertically  $30^\circ$  or  $40^\circ$ , of a uniform yellow tint. Various members of the Section spoke on the subject. Lieut. Morrison, R.N., had seen similar phenomena; but no definite conclusion was arrived at as to the cause: and the section, after having voted thanks to Dr. Robinson and others, finally closed its labours.

#### SECTION B.

Mr. Dick exhibited and described a Cast-iron Bottle of a new construction, for generating Oxygen Gas from Common Oxide of Manganese.

Professor Johnston then read his very able report 'On Dimorphous Bodies.' Dimorphous bodies, he stated, as far as observation has gone, are very limited; and he exhibited a table of those already known. They are bodies whose mechanical structure is different as respects the form of the crystal, but whose component parts are chemically alike; and having this further quality, that such bodies are capable of replacing each other. It would appear that sulphur crystal rises into different forms, when subjected to different degrees of temperature; the name then given is dimorphous. Carbonate of lime crystal rises into two forms; so also does the carbonate of lead. It then becomes an exceedingly important question to chemists, to ascertain what is the nature of this difference. Although he had stated that these bodies were capable of replacing each other, it was by no means to be assumed that their ultimate molecules were alike; on the contrary, we were not sure but that all bodies may have the same property. Yet, so far as he had been able to observe, a relation existed between all dimorphous bodies; and, when it was considered that they are capable of replacing each other, they must have a general analogy of constitution, although the area and base of each may be essentially different. If he might be allowed to give an opinion on the subject, he would say that the principal cause of dimorphousism was temperature. As an instance, the protoxide of lead, when heated to a certain temperature, becomes red; at a lower temperature it is yellow; and the crystals of each are essentially different. Sulphur, at a moderate temperature, becomes liquid; at a still higher one it becomes thick; and, at a still higher, it becomes again liquid. The result of the report was, that, taking into consideration these and other facts, it followed that there must be a molecular dif-

ference between the crystals of these bodies. There was no other method of accounting for the difference of appearance.

Professor Whewell, after examining the tables produced by Professor Johnston, and bearing testimony to the profound research of that gentleman, asked whether he had detected any definite optical difference between the crystals of dimorphous bodies. He also objected to the frequent use made of the term atoms; and remarked, that until we came to some definite conclusion as to what atoms really were, it was worse than useless to employ a term which suggested nothing definite.

Mr. Penning also objected to the use of the term atom.

Dr. Kane said, that although the term was used, it merely was in relation to the proportions in which matter was formed.

Mr. Faraday also objected to the term atom. He had never used it, and considered it to be an inapplicable term. He regretted much that Dr. Dalton should have applied a term to which something tangible was attached, to such a purpose. The true proportion would not lead to any misapprehension, and it was quite reasonable to suppose substances to unite in half proportions; whereas, the idea of half an atom was particularly absurd. Professor Johnston had merely used the term atom in conveying a popular idea of his experiments to the meeting; the term would not occur in his written report.

Professor Whewell said, that, at their meetings, professors should be cautious in the language they used; and if any erroneous expression were allowed to pass unnoticed, it would be imagined by those ignorant of the subject, that they were correct, and the tacit admission of the society would be construed into an authority. He considered the Association to be the guardians of the pure technology of science.

Professor Liebig was called on to read a paper, 'On the Products of the Decomposition of Organic Bodies;' but, as he feared his foreign pronunciation of the English language might cause him to be ill understood, he requested Mr. Faraday would do him the favour to be his representative. This request being acceded to, Mr. Faraday read the paper which was upon *uric acid* and *urea*. The subject is one of infinite interest to all organised beings such as man; and yet it is extraordinary how little attention has been paid to it. That we are fearfully and wonderfully made, is a truism; and what inquiry can be more important than an investigation founded on the decomposition and recombination of any portions of our animal structure, so as to lead us to the light in regard to that formation? *Allantoin* is, we believe, the only organised substance previously treated in the same manner with the present subject; and the results, in both cases, are very curious and striking, though, from the character of the experiments, they are not such as would suit any but a medical journal. Suffice it to say, that *urea* is the base of *uric acid*—a remarkable agent in our economy. We are unable to detect it in any except one branch of our system; and it seems to be composed of 10 carbon, 4 nitrogen, 4 hydrogen, and 6 oxygen.

Both in the Section, and afterwards in the Amphitheatre, it was generally acknowledged that the talents of English chemists had been directed far too little in this direction, Dr. Prout being almost if not the only individual who had written upon it; and it was strongly recommended to more especial notice. On the Continent, it has of late been more attended to; and Professor Liebig's labours were highly praised.

It will be seen that a grant of money has been voted for their further continuance; as well as a similar grant for experiments on *inorganised* bodies to Professor Johnston.

Mr. Ettrick's Paper 'On a New Mode of Bronzing Gun Barrels' was next read. It appeared that, having ineffectually attempted to elicit the secret from the gunsmiths, Mr. E. had accidentally hit upon a more simple and effectual mode himself. His recipe was to apply one part of nitric acid, diluted with one hundred parts of water, with a rag to a gun-barrel, care being taken that the liquid did not run down the barrel. This being applied six times, the barrel was dried in the sun, and afterwards coated with a solution of one grain of nitrate of silver dissolved in one hundred parts of water. The barrel is finally, when dry, to be polished with bees' wax.

A discussion then took place upon the Strength of Iron by the Hot and Cold Blast, being almost a repetition by Mr. Fairbairn, of what he had already stated to the mechanical section.

Mr. Mushett stated the result of experiments made, the preceding day, at a foundry in Liverpool, for the purpose of ascertaining the loss in remelting cast iron by the hot and cold blasts. It appeared that there was little or no difference; the loss being from  $2\frac{1}{2}$  to  $3\frac{1}{2}$  per cent in each case, the least loss being in the hot-blast iron. It thus (as he contended) was proven that the waste complained of in hot-blast iron was totally without foundation.

Dr. Thomson read his 'Report upon the Specific Gravity of Nitric Acid and Alcohol,' illustrated by long tabular statements.

Dr. Dalton's paper was then read by his brother, 'On the New Production of Carbonic Acid by Plants Growing in the Atmosphere.' The subject is a favourite one of the doctor's, and the title gives the result of his experiments. It is worthy of remark, that the paper was written by Dr. Dalton for the Association, since his serious attack in February last.

The proceedings of the day, and of the section, were then closed by the reading of a long paper, by Mr. Rigg, on the peculiar changes which occur during the growth of vegetables.

#### SECTION C.

Mr. Murchison read a Paper, 'On Professor Agassiz's New Genera of Fish in the Silurian Rocks.' After complimenting the learned gentleman on the many important discoveries he had made, he said that he was glad to state that the grant of 100 guineas had been renewed by the society to enable him to carry on his great work. That the 8th and 9th *livraisons*, devoted entirely to English fishes, had been sent to him (Mr. Murchison), but had, unfortunately, been mislaid. Mr. Agassiz, he continued, considered fishes as the true phenomena of the age of the rock in which they were found, and that each district of rock was known by its peculiar species of fish. As to the circumstance of a fossil fish having been found, in good preservation, in the ancient Silurian rock, he (Mr. Agassiz) had never seen such fishes in such strata; and he trembled lest they should belong to classes which he had never mentioned: but, to his joy, he found that he had not only noticed them, but accurately described them. Professor Sedgwick stated, that, in general, geologists, when giving names to new discoveries, pitched upon some barbarous and crackjaw words; but, he was happy to say, that, although Mr. Agassiz certainly composed his names of compound Greek words, they were of a truly classical nature. He also begged to draw the attention of the Section to some fossils which had been brought from New South Wales.

Mr. Griffiths said, that, at the meeting held in Dublin, he had promised to bring forth his Geological Map of Ireland; but, as some improvements were being made, he begged to shew the proof sheets of the engraving, as many people might think it was a long time coming out. The scale was that of four miles to one inch, being larger than the Map of England by Mr. Greenhough, the scale of which was six miles to the inch. He then proceeded to describe a coloured section of the carboniferous limestone of Ireland, running from east to west, from Butler's Bridge (180 feet above the level of the sea) in the county of Cavan, to the sea below Benbulbin, on the opposite coast. In describing the various strata, &c., he pointed out the valley of the Shannon at its source, 298 feet above the level of the sea; also, the mountain Benbu (1365 feet above the same level), which, he said, was composed of gray granite, the face, in most parts, studded with garnets. He begged to call the attention of the section to the geological difference between England and Ireland, the latter being nearly all limestone; the different lines of demarcation were also accurately described. Some fossils were exhibited, found in the limestone in Sligo, all of which were before known with the exception of one, called, by the inhabitants of the country, the old cow's horn; also, some marine shells, &c., found in the gray shale, in the mountain of Kuleagh.

Sir Philip Egerton remarked, that the study of organic remains was very important; that it was at the mountain of Kuleagh he, with hammer in hand, first commenced his researches, but that he had never been able to ascertain any fossils in the bed of sandstone of that mountain.

Mr. Greenhough and Professor Sedgwick here argued, whether it was possible to distinguish particular beds by particular fossils.

The Rev. D. Williams next read a paper, 'On some Specimens of Fossil Wood he had discovered in the Graywacke of Devonshire,' and wished to know the date of the peculiar deposit in which these plants had been found. A very strong argument took place, whether the Graywacke rock, in which these plants (which were of coal formation) were to be found, was of the coal formation, or Silurian. Mr. Murchison was of the former, and Messrs. Greenhough and De La Beche of the latter, opinion.

Professor Sedgwick was partly of Mr. Murchison's opinion, and said, perhaps the plants had not been clearly proved to be of coal formation; if they had, there must be a difference between the upper and lower parts of the culm measure.

Mr. Hopkinson read a paper, 'On the Refrigeration of the Earth.' He supported the theory that the earth originally existed in a state of liquid fire; and, from its form, and the nature of its crust, contended that, cooling throughout the period of many thousands of years, its present appearance fully warranted this philosophical conclusion; and that it might become solid, either from causes operating on the surface or at the centre. This theory, he remarked, was rejected by many, because, as they asserted, it did not agree with the Mosaic account of the creation; but to such persons he would say, that this account is only to be taken as regards man, and not as regards the actual age of the earth. There were some who made a bad use of the truths which geology made manifest, and made it a peg to hang their irreligion on; but these truths did not make the philosopher irreligious, but, on the contrary, made his religion rest on a firmer basis. Professors Whewell, Phillips,

and Sedgwick, testified their approbation of the paper just read, and praised the philosophic caution that had characterised the researches of Mr. Hopkinson.

#### SECTION D.

The following was the list of the last day papers.

1. Mr. R. Mallet—On the Power of Reproduction in Aged Trees from the Centre of the Trunk.
2. Mr. J. Smith—On some Undescribed Shells.
3. Mr. Macleay—On the Destruction of the Pier at Southampton by Lymnoria Terebrans.
4. Mr. Gray—On some New Shells in the Royal Institution of Liverpool.
5. Rev. J. Reade—On the Solid Matter found in the Ashes of Plants and Animals.
6. Mr. J. Sibson—On the recent Disease in Potatoes.
7. Mr. F. Taylor—An Exhibition of Gollathus Magnus.
8. Dr. Lindley—On the Affinity of Orobanche.
9. Mr. N. A. Vigors—On the Arrangement of Birds according to their Affinities.
10. Mr. W. H. Smith—On Garden Tillage as applied to Agricultural Purposes.

Thanks were voted to Lord Derby for his reception of the Section, &c. on the preceding day. Mr. Mallet's paper related some curious illustrations of his subject. Mr. Smith's shells we have elsewhere described.

Mr. Reade's experiments on the solid parts left after the combustion of animals and vegetables, upon which, also, Professor Henslow expatiated, shewed that the deposits were purely silicic; whilst on the other hand, similar experiments made on silicious structures, proved their great analogy to plants and animals.

Dr. Lindley offered some remarks on the subject of the affinities of the orobanche, to shew that it had no connexion with the natural order *Scrophularia*. By a French writer it is placed with *Gentiana*, who states that it had the flowers of the former and the fruit of the latter. Another Russian writer removed it, and placed it in a distinct order. He found upon examination, that it did differ from the *Scrophularia* in the situation of the carpels, and in this respect it becomes more clearly identified with *Gentiana*. From all circumstances, he would consider it more nearly belonging to the latter; but there was a question whether it was not connected with *Monoptera*. So far as the presence of albumen in seeds depended, it was not to be considered a specific mark of distinction, and, therefore, we must look out for some more specific mark. It will be found necessary to separate the present distinctions of monocotyledonous plants, the affinities being so often violated.

Mr. Taylor exhibited a specimen of *Gollathus magnus*, with the jaw of a shark, and oil extracted from its liver. The former differed from all specimens previously noticed, in the form of its head. With the exception of a specimen in the British Museum, this is the only one ever exhibited. The shark was taken off the ale of Manse, in the William Nash, and the liver was supposed to contain about fifty gallons of oil.

Mr. Macleay gave a description of a new fungus which he had seen the day previous in the window of a hotel in the town.

Mr. Macleay referred to a letter read from Captain Ducane, on the changes taking place in the Palæmons, and also exhibited some pieces of the wood of the pier at Southampton, which is almost destroyed by the "gentle action of soft water." The protection afforded to the port is such as is favourable to the propagation of the Lymnoria terebrans; and for this circumstance he had recommended the rebuilding of the pier with stone. The insect was first discovered by Dr. Leach, and has destroyed several piers upon the coast.

Mr. Hope suggested the use of what is called gas lime, which is very noxious to the insect, as

the foundation of piers of wood; and also the use of iron pipes, that had become corroded from the gas.

Dr. Lindley suggested that the piles should be well saturated with solution of corrosive sublimate, which would probably be a perfect protection.

Mr. Macleay considered that sea animals would attack any metal, but that the clearness of the copper protected, according to the plan of Sir Humphrey Davy, was owing to a poisonous medium on the surface, from which circumstance he recommended that the piles should be covered with copper.

Mr. Gray described several new Land Shells in the collection of the Royal Institution, remarking on the importance of such local exhibitions in the advancement of subjects of scientific inquiry, and recommending the attention of such objects to local naturalists. These were a new genus of land shell between *Helic* and *Anostoma* and some new species which he designated as *Achalma furcata*, *Coracolla filomarginata* from India, and *Paludina galeasi*, the largest and most beautiful species of the genus. He also exhibited a new land shell, being the first of the kind seen in this country, found by Mr. G. Aberazzi of Preston, a local naturalist.

Mr. Vigors postponed the reading of a paper, 'On the Affinities of Birds,' until the next meeting, on account of the shortness of time allotted to the meeting of the Section.

A member remarked on the first paper, and asked the opinion of the meeting upon whether the circumstance of trees growing within trees was not produced by natural grafting. A long conversation ensued, in which Professor Graham and others took part.

Mr. Hope described several new Species of Insects which he had found in a collection in Liverpool, possessed by Mr. Mally, containing several specimens not included in any other collection in Europe.

Mr. Macleay took a review of the proceedings of the Section during the present sitting, which he characterised as not being of less importance or interest to any other, and being equally varied.

The thanks of the Section were proposed to the chairman by Professor Graham of Edinburgh, who complimented him and the Section upon the very efficient manner in which the chair had been filled.

#### SECTION E.

Thanks were voted, on the motion of Dr. Yelloly, to Dr. Rutter and the other members of the Medical Institution for the great accommodations they had afforded the Section.

Dr. Warren (Boston, U.S.) read a paper, 'On the Skulls of Mound Indians,' i. e. the *crania* found in large mounds in the interior of North America, as compared with those of South American Indians. He stated that a considerable number of years ago, he accidentally came into possession of a cranium, which struck him as an extraordinary one; and, on examination, he found that it differed from the crania of all the well-known nations, and the individual nations composing those races. He was led by this to make some inquiry into its history, and he ascertained that it came from the banks of the Ohio river, far back in America, in what was called the Western Country, and that it was discovered in a cavern on the top of a high and almost inaccessible rock, at the distance of about forty or fifty feet from the banks of the Ohio, by some hunters who took refuge in the cave. They there found the skull and the other bones of the skull in a fine state of preservation.

The bones were so situated, that they might have been there for several ages without decomposition, the calcareous rock which formed the bottom of the cavern absorbing all moisture. From the inaccessibility of the place in which they were found, it was probable that they had remained there for centuries. It was natural to suppose that this head must have been one of the aboriginal Indians of North America; but, on examination, he ascertained that that was not the fact, its whole structure being different to the Indian crania. He suspected that it might have connexion with those races which had been discovered to be deposited in the ancient works or mounds of North America, and he soon obtained heads from that part of the country, and satisfied himself of the fact. He would presently state the particulars in which they differed from other heads. They had frequently heard of the mounds in the interior of North America. They were exceedingly curious, and were found in the wilds which had scarcely been trod by the foot of civilised man, and were covered with immense forests. They found elevations of earth which were quite extraordinary, and would be so even in any country. These mounds were covered by immense trees, and the observer was struck at once with the great antiquity which must belong to them. There were different kinds of mounds. There were some which had a great resemblance to fortifications, regularly made, and of considerable extent. There was one at Cuëum, which was more than a mile in diameter, and which was surrounded by a high kind of wall or fortification, about thirty feet in height, with regular openings in different parts of it, and these openings guarded by interior works, similar to fortifications, to defend the entrances to apertures in fortifications in the present day. These mounds were generally situated near the confluence of important rivers; there was one at the conflux of the Ohio and Muskingdom rivers; they were so situated as to command the passage of the rivers. The mounds in the interior of these fortifications were perfectly regular, flat on the summit, and frequently a sort of bowl or centre part on the top of the summit. They were, apparently, intended for the purposes of interment, and partly for places of worship; and, probably, the excavation found on the summit was a place where human sacrifices were made. Some parts of the work of these mounds were very similar to parts found in South America, in the great temple at Calumna. These works were of very great extent, extending a length of 1000 miles, from the banks of the great lakes in Canada to the Gulf of Mexico, and filled all the most fruitful parts of North America. The head he had spoken of as having obtained, was taken from one of these circular mounds, and, in common with all the heads taken from those mounds, differed from the Indian and European formation. There was less extension of forehead than in the European head, but it resembled it; the elevation of the forehead being equal to the Caucasian race. The vertex also was uncommonly elevated. The seat of the organ of veneration seemed to be very much developed; and it was evident that they were a very religious nation, for there was evidence that they made many sacrifices. The formation of the skull approached to the Peruvian. But the most remarkable fact was, the flattening of the occiput, which gave the cranium a peculiarly rounded form, and some even were quite circular. The occiput also was almost always more flattened on the right side than on the left. Another pecu-

liarity in these heads was, that the *palatine fossa* was of a rounded form; this arose from its narrowness. The lower we descended in the scale of races, the nearer we approached the animal formation. They knew that in the animal formation the jaws were very elongated, which gave them greater perfection in taste and smell. There was an approximation to the African race, in a small degree, in the North American Indian; but, as we rose to the Caucasian race, the palate was shorter and smaller; so that, probably, taste and smell was inferior in the Caucasian races. So that animals, probably, had a power in discriminating noxious smells and herbs, which we had not. After he had been in possession of these heads for a number of years, he was anxious to generalise his remarks. When he was expecting contributions from the interior part of the country—for the mounds were situated very far from the part where he lived, many thousand miles; it was difficult also to obtain these bones, as many of them were found in a state of decomposition—he found one morning three heads lying on his table, the party who had left them having gone. He immediately examined them, and stated them to be skulls of the Mound Indians. But, a few days after, the gentleman who had furnished them, came to Boston, and said to him, that these heads were the heads of Peruvians, and that they were taken from an island near the city of Sibia, a place renowned amongst Peruvians, where Mango Copa was said to have descended from the sun, in order to enlighten the Peruvian race. He afterwards shewed the skulls to Dr. Spurzheim, and he said they were all precisely of the same race. He perceived that the organ of constructiveness was peculiarly developed in all these heads. This led him to inquire further into the history of the Peruvian heads, and he found three descriptions: one similar to the one he had been describing, having a flattened occiput, temples wide, and forehead particularly elevated. But there was another description, much more common, which was of an oblong form, and very much resembled an egg in shape. In this, the occiput, instead of being compressed and flattened, was very prominent indeed. Then, there was a third kind of Peruvian head, which did not exhibit any marks of compression. The first kind were all remarkably irregular, and wanting in symmetry. These heads had evidently been artificially flattened on the occipital and frontal part, and were well known to belong to the Inca race of Peruvians, as they were taken from the place where they were buried; and they also had some specimens of the people amongst them. [The lecturer here described that a whole family of the noble race of Inca had been buried with their clothes, and every part of them was in a surprising state of preservation, just as they lived before the Spanish conquest. The tomb in which they were found, was circular, like a well, lined with bricks, and near the bottom a flat stone was put down, supported at the sides like a floor, leaving a large cavity underneath. The bodies were then put into the tomb upon this stone, and loose earth thrown over them. The cavity underneath the tomb drained off the water and damp, and the bodies were thus preserved.] Having traced the exact similarity between the Mound skulls and the Peruvian skulls of the Inca race, the conclusion was irresistible, that these two people had a cognate origin. Now, they were situated at a distance of 1000 or 1500 miles from each other, and the heads of the intervening nations were entirely different from the one or the other. At

first this appeared to him very extraordinary. And here he might remark on the great importance of investigations by anatomists, to point out the history of those nations which tradition did not hand down to them. There was a race between these two races, and they had heads almost as flat as a pancake. [A Peruvian head was here exhibited, which had been subjected to artificial compression, and which was nearly square, being perfectly flat behind, and nearly so on the forehead.] He must say, for the benefit of phrenology, that so far from the intellects of these flat-headed persons being inferior, the Indians who possessed them were quite equal in intelligence to others of the same nation. He had the head of a celebrated chief who had a most extraordinarily flattened forehead, and he was known to have remarkable talent. In fact, no person was thought of any consequence in that country, unless he possessed a flat head. They then legitimately inferred, that these two nations were closely allied to each other: that was, the nations who had inhabited the Mounds, and the Peruvians, because there was no resemblance between the heads of these nations and any other heads that were known. He might conclude with just intimating that there had been observed to be a resemblance between these two sets of heads, and the heads of the Hindoo race; the same rounded form, and similar smoothness in the bones of the head and face. The conclusion drawn was, that the race of the Mound Indians was entirely dissimilar to the North American Indians; and second, that they were entirely similar to the Peruvian race, which would lead to the inference that these two were one race, which was an evidence, also, that the American Indians had emanated from two different sources, one from the south part of America, and the other from the north-west coast.

Upon this paper a phrenological discussion was got up; but it was not allowed to last very long, or at least so long as the phrenologists present seemed to desire.

Professor Evanson read an able treatise, 'On the Functions of the Brain;' which also led to phrenological opinions, &c.; the endless controversy about which was ended by the decision of Dr. Carson, in the chair.

Dr. McIntosh made a communication, 'On some Morbid Anatomical Appearances in cases of Cholera;' and Dr. Carson 'On the Circulation of Blood in the Head, and the Use of Ventricles in the Brain.'

The usual compliments and thanks being voted, the Section closed its labours, which produced several very valuable papers; some of little consequence, and the common consumption of time in elucidating medical truths (or the negative) by medical debate.

#### FINE ARTS.

##### NATIONAL MONUMENTS, WORKS OF ART, ETC.

A CORRESPONDENT informs us that the spirit which assembled the meeting at Freemasons' Hall, for the purpose of obtaining free admission to national monuments and works of art in public edifices, is spreading into distant parts of the country. The dean and chapter of Norwich have set an example of liberality upon the subject, by ordering the venerable cathedral of that city, which contains so many monuments of successive ages, to be kept open for public inspection one hour every day, in addition to the usual periods of divine service. In Edinburgh, also, the late disgraceful scene, when the Turkish ambassador was refused a

sight of the Scottish regalia, appears to have excited so much disgust, that the Lord Provost and council have applied to have those objects of national and general curiosity henceforth exhibited to the public without charge or restriction.

#### NEW PUBLICATIONS.

##### *Proofs of the Plates of Ackermann's Forget-me Not, for 1838.*

TEN very pleasing plates; headed (the place which it deserves) by a fine and expressive female portrait, engraved by Thomson, from a picture by Lawrence, and entitled "La Sevillana." Of the other specimens, our favourites are—"Rosanna;" a charming "Meditating Maid," engraved by Rolls, from a drawing by Jenkins; "The Rich and the Poor," an interesting familiar scene, engraved by Stocks, from a drawing by Parris; "The Christening Party," a brilliant sunset, engraved by Greatbach, from a picture by Knight; and "Cloisters of Santo Paolo, Rome," a magnificent exhibition of columnar architecture, engraved by Carter, from a drawing by Prout.

##### *Illustrations to Friendship's Offering, for 1838.* Smith, Elder, and Co.

A TASTEFUL and entertaining *mélange*. We would point out, as especially entitled to admiration—"The Hon. the Misses Beauclerk," two graceful and elegant portraits, engraved by F. Bacon, from a drawing by A. E. Chalon, R.A.; "Torcello," a singularly picturesque port, engraved by A. C. Armytage, from a picture by C. Stanfield, R.A.; "Youth and Beauty," either of which might easily be mistaken for the other, engraved by J. C. Edwards, from a picture by Miss F. Corboux; "The Forsaken," who certainly does not deserve to be so, engraved by A. Fox, from a picture by T. Harper; "The Captive's Wife," an interesting union of conjugal grief and maternal affection, engraved by W. H. Simmons, from a picture by T. M. Joy; and "Still in my Teens," whose wisest wish would be never to be out of them, engraved by H. Cook, from a picture by H. Richter.

#### BIOGRAPHY.

##### MR. SAMUEL WESLEY.

THIS accomplished scholar, and extraordinary musical genius, expired without a struggle, on the afternoon of Wednesday, the 11th instant, about twenty minutes past four o'clock. The following biographical sketch of him is abridged from a notice which has appeared in a morning paper.

Mr. Wesley was born on the 24th day of February, 1766; he was, consequently, in his seventy-second year. When only three years old, he could play and extemporise freely on the organ; and before he was five, had taught himself to read and write a print-hand, from his unremitting study of the oratorio of *Samson*, which he committed entirely to memory. He also learned by heart, within a month, the whole of Handel's overtures; and before he was eight years of age, he had composed and written out an oratorio, which he entitled *Ruth*. Before he reached the year of his majority, he had become an excellent classical scholar, a fine performer on the pianoforte and organ, and unquestionably the most astonishing extemporaneous player in Europe. His prospects in life were unfortunately clouded by a dreadful accident which befel him in the year 1787. Returning from spending the evening with an intimate friend, in passing through Snow-hill, he fell into a deep excavation, which had been

prepared for the foundation of a new building. Here he lay insensible, until daylight disclosed his situation, and he was conveyed home. His head had received a most serious injury, and the medical attendants wished to perform the operation of trepanning; but Wesley obstinately refused his consent, and his wound was permitted to heal. This he ever after regretted; for, it is supposed, that in consequence of some portion of the skull adhering to, or pressing upon the brain, originated those periodical states of high nervous irritability, which subsequently checked and darkened the splendour of his career. For seven years immediately following his accident, he remained in a low desponding state, refusing to cultivate his genius for music. On his recovering, he prosecuted the science with the utmost ardour, bringing to light the immortal works of Sebastian Bach, then alike unknown here and on the Continent. In 1815, when on his journey to conduct an oratorio at Norwich, he suffered a relapse of his mental despondency; and for another seven years, he retired from public life, endeavouring to find relief in the constant attendance upon public worship, and living with the austerity of a hermit. In 1823 he recovered, and up to 1830, composed many excellent pieces, and was much engaged in public performance on the organ. He then relapsed into his former state; but in August last, partially regained his health and spirits. It soon became evident, however, his constitution was undergoing a great change. When at Christchurch, Newgate Street, about three weeks ago, he rallied, passed a delightful day, and spoke in the evening of Mendelssohn, and his "wonderful mind," in terms of the strongest eulogy. On Saturday last he played extemporaneously to a friend, and composed some psalm-tunes. On Monday he endeavoured to write a long testimonial for an old pupil, but which his strength only permitted him to sign; and in the evening retired to his room, with a presentiment which has been but too accurately verified.

As a musician, Mr. Wesley's celebrity is even greater on the Continent than in his own country. His compositions are grand and masterly; his melodies sweet, varied, ever novel and unexpected; his harmonies bold, sublime, and imposing. His resources were boundless; and if called upon to extemporise for half-a-dozen tunes during an evening, each fantasia was new, fresh, and perfectly unlike the others. His execution was very great—close and neat, and free from labour or effort; and his touch on the piano-forte delicate and *cantabile* in the highest degree.

Mr. Wesley was remarkable for energy, firmness, nobleness of mind, freedom from envy, penetration, docility, approaching to an almost infantile simplicity, and unvarying adherence to truth. These characteristics were united with a credulity which exceeded, if possible, that which marked his uncle, the celebrated John Wesley. His passions were exceedingly strong; and, from a habit of always speaking his mind, and his having no idea of *management*, or the *finesse* of human life, he too often, by the brilliancy of his wit, or the bitterness of his sarcasm, unthinkingly caused estrangement, if not raised up an enemy. His conversation was rich, copious, and fascinating. No subject could be started which he could not adorn by shrewd remarks, or illustrate by some appropriate and original anecdote. For many years it had been his constant habit to study the Bible night and morning; and as no meal was taken before he had offered up his orisons to Heaven, so he never lay down without thanks-

giving. He has left a large family, nearly all of whom are distinguished for their talents and acquisitions. The younger branches, although of very tender years, display evident indications of fine intellect, and that exquisite sensibility which characterised the parent.

### DRAMA.

**Drury Lane.**—This theatre,\* still under the management of Mr. Bunn, opened on Saturday with *The Merry Wives of Windsor*, and a new drama by Mr. Planché, entitled *The Child of the Wreck*. The former introduced Dowton and Miss H. Cawse, and the latter Madame Celeste, whose trip to America has not at all spoiled her; she is still a sweet actress, and materially assisted the success of *The Child of the Wreck*, which is, however, a good melodrama, but rather too long.

**Covent Garden.**—A three-act play, entitled *The Novice*, was produced on Wednesday evening with considerable and, with few exceptions, well-merited success, at this house. We have not yet heard the author's name; but he appears to be well acquainted with stage business, and has thrown some highly dramatic scenes into this play, which would, however, be far more effective but for the exceptions we are about to take. In the first place, it is too long, and requires curtailing as much as any modern production we remember; indeed, whole scenes might be left out, and others shortened, with great advantage; but we do not like finding fault, so will proceed with the merits, which greatly predominate. The story is laid in Bavaria, the Elector of which place (Warde) is blessed with a jealous wife, whose whims and fancies are not, however, without foundation, as the Elector is in the habit of consoling himself with other compliant beauties, for the hen-peckings he gets at home. In his search after these he is aided by his Jew prime minister, *Baron Solomons* (Bartley), with whose assistance he is about to add another to his already numerous collection, of whose portraits, by the by, he has a celebrated gallery, known as that of the "Court Beauties." This other is *Clothilda Lilienstein* (Miss Faucit), who has been educated at a convent, where she has fallen in love with a young artist, *Herman Verstein* (Anderson), by whom her love is returned. On her way to court she is waylaid by *Herman*, who has been urged to this step by *Count Carolstadt* (Vining), who turns against him by the advice of *Solomons*, and aids in the rescue of *Clothilda*, being promised a handsome *douceur* and a colonelcy in the guards, on condition of making her his wife; this he accepts, and she proceeds to court: offended at her lover's unkindness, she is induced to sign a marriage contract with *Carolstadt*, which, after a tedious explanatory scene, he destroys, and the lovers are

made happy. Here we might conclude, as we have not space to give the underplot, which is, however, well constructed; but we must notice the acting, which was, in every respect, most excellent. Warde, Bartley, Vining, Meadows, and Mrs. W. Clifford, deserve great praise for their exertions in the author's service, as does Miss Faucit, who acted a good part with great judgment and grace; but our best acknowledgments are due to Mr. Anderson, who played the artist in a delightful manner; nothing was overdone nor left undone, and he made a trifling part quite prominent. Some of the scenery is new and beautiful, and no cost seems to have been spared in the production of the *Novice*, which, with the judicious curtailing already noticed, will become a standard piece at Covent Garden.

**Haymarket.**—Mr. Sheridan Knowles' new comedy, *The Love Chase*, was produced on Monday, and has been played every evening since with great and increasing success. It is one of the most charming productions we have witnessed for a very long time, and is acted in a style of unsurpassable excellence: we shall not give any details, as every one will go and see it; but we extract the following passages to shew the poetry scattered through the scenes.

#### The Chase.

"Well, Master Wildrake, speak you of the chase!  
To hear you one doth feel the bounding steed;  
You bring the hounds and game, and all to view—  
All scudding to the jovial huntsman's cheer!  
And yet I pity the poor crowned deer,  
And always fancy 'tis by Fortune's spite,  
That lordly head of his, he bears so high—  
Like Virtue, stately in calamity,  
And hunted by the human, worldly hound—  
Is made to fly before the pack that straight  
Burst into song at prospect of his death.  
You say their cry is harmony; and yet  
The chorus scarce is music to my ear,  
When I bethink me what it sounds to his;  
Nor deem I sweet the note that rings the knell  
Of the once merry forester!"

#### Original and Gastronomical Simile.

"Her voice  
Comes melting from her round and swelling throat,  
Reminding you of sweetest, mellowest things—  
Plums, peaches, apricots, and nectarines—  
Whose bloom is poor to paint her cheeks and lips."

#### Description of a Lady Dancing.

"Yet that's a trifle to the dance! down which  
She floats as though she were a form of air!  
The ground feels not her foot, or tells not on't;  
Her movements are the painting of the strain,  
Its swell, its fall, its mirth, its tenderness!"

#### Canoeing in Love.

"I cannot think love thrives by artifice,  
Or can disguise its mood, and shew its face.  
I would not hide one point of my heart,  
Where I did give it and did feel 'twas right,  
Nor feign a wish, to mask a wish that was,  
Howe'er to keep it. For no cause except  
Myself would I be lov'd."

#### A Hunt passing through a Country.

"To wood and glen, hamlet and town, it is  
A laughing holiday!—Not a hill-top  
But 'then alive!—Footmen with horsemen vie—  
All earth's astral, roused with the revelry  
Of vigour, health, and joy!—Cheer awakes cheer,  
While echo's mimic tongue, that never tires,  
Keeps up the hearty din! Each face is then  
Its neighbour's glass—where gladness sees itself,  
And, at the bright reflection, grows more glad!  
Breaks into tenfold mirth!—laughs like a child!  
Would make a gift of its heart, it is so free!  
Would scarce accept a kingdom, 'tis so rich!  
Shakes hands with all, and vows it never knew  
That life was life before!"

We do not hold that the study of the olden dramatists has been of much service to Knowles: from them he gets quaintnesses—peculiar phraseology—now quite out of use; but it is in himself and his warm true feelings, that he finds the snatches of poetry that are his great and prevailing charm.

Of the actors and actresses we have naught to say, for it would be invidious to select any of them for particular praise, except Mrs. Nisbet, who plays the part of *Constance* in the most perfect manner, and draws down the most rapturous applause; for ourselves, we shall

hate to see any one else in the character, doubting if it be possible for it to be acted as it is by Mrs. Nisbet. The *Swiss Swains* likewise continue a prosperous career. We believe the dialogue is from the pen of Mr. Webster, who plays one of the swains himself; the other is sustained by Mr. Collins. The story, though exceedingly improbable, is very amusing; and *Swiss Swains* nightly follow in the wake of *The Love Chase*.

**St. James's.**—The *Cornet* has been played every evening with increased applause, but we are almost unable to redeem our last week's promise of a more detailed notice, as the plot is too intricate for us to transfer it to our pages; we can, however, state, that it is capitally acted and sung by Misses Rainforth and J. Smith, Messrs. Ginbelle and Burnet. It is full of incident and very entertaining. The public do not patronise Mr. Braham in the way he deserves, for he is really an excellent caterer: his own appearance will, we hope, draw better houses, though those that have already passed, have been far from bad. The *Assignment* also retains its place, and is well worth seeing; Harley's acting of *Pierre Dubois*, which Vernet rendered so complete, is a capital conception, in a very different style, of the same part. To our readers we sincerely recommend a pleasant evening's amusement at the St. James's, which is certainly the handsomest theatre in London, not even excepting "that jewel of a place" the

**Olympic**, where Madame Vestris is reaping a rich harvest in overflowing houses. A new farce, produced on Thursday, was completely successful. We shall speak further of it hereafter.

**Adelphi.**—Yates has transplanted *The Dumb Man of Manchester* from Astley's, where it was extremely popular, and engaged Ducrow to personate the character, which he does with great truth and interest; his acting is, in fact, quite as intelligible as speech, and the *Dumb Man* in conjunction with Power's *Rory*, has drawn bumper houses since our last.

**The Strand** concluded a prosperous season on Thursday, on which evening Mr. W. J. Hammond had an overflow for his benefit.

### VARIETIES.

**Statistics.**—The importance of obtaining full and regular statistical reports and returns, on the authenticity of which implicit reliance may be placed, has been long and generally felt. A periodical publication, devoted to the subject, has at length been commenced, under the title of "The Statistical Journal." An examination of the first Number, and our acquaintance with the talents and attainments of its editor, satisfy us that, if this work be supported as it deserves, it will be the means of diffusing "a vast mass of valuable information, digested in an available form, for statesmen, political economists, men of business, and, in short, every reader who seeks to store his mind with truly useful knowledge." One of the most interesting papers in the first Number relates to the statistics of France.

**The Elgin Marbles and the Public Taste.**—In the report of the parliamentary committee on arts and manufactures, it is recommended that casts of the best specimens of sculpture be transmitted from the metropolis to other towns, at the lowest possible cost, in order to facilitate the formation of galleries at various institutions, and thereby disseminate good taste. This object has been opportunely advanced by the request of the French government to ours, for permission to have the Elgin marbles cast for the benefit of their national exhibitions.

#### \* DRURY LANE THEATRE.

##### "To the Editor of the 'Morning Chronicle.'"

SIR,—Allow me to call your attention to the practice adopted by the present management of this theatre. The proprietor, when he announced the performances for the first night of the season, also announced the prices of admission as reduced; the pit, for instance, to three shillings, the half-price, one shilling and sixpence. Now, sir, on my presenting myself at the pit-door on Tuesday evening for the half-price, two shillings were demanded as the price of admission. Several persons observed to the cashier that the price advertised was one shilling and sixpence, but he coolly observed, "that he believed it was so, but there was some mistake in the announcement." This is an imposition upon the public which I am satisfied has only to be brought to your knowledge to insure your early notice of it; and thus prevent the public being exposed to a practice very annoying, though, no doubt, it has the merit of benefiting the treasury of the proprietor.—I am, Sir, your most obedient servant,

"Oct. 18, 1837."

A CONSTANT READER."

This letter requires no comment from us; it is extracted from the "Morning Chronicle" of yesterday.—*Ad. L. G.*

It was not considered advisable to trust the operation to any but the moulder usually employed by the British Museum; but, in order to meet the wishes of our enthusiastic neighbours, Mr. Sarti has received orders to cast those valuable remains of antiquity, and the recommendation of the committee on arts is to be carried into effect by the sale of those admired relics of Grecian taste at the price of the plaster and labour. This looks like encouragement to taste, and it is hoped that the managers of literary and scientific institutions will not neglect the advantage thus offered.

**Weather Wisdom.**—Quite out all the week: we hope for better success in that to come. "The 15th will be milder, as the sun has the declination of Jupiter. Changes on the 17th. The sun aspects Jupiter on the 19th, which mends the weather a little; but on the 20th the balance will turn in favour of cold."

**Clerical Duet.**—"The Queen," says a Brighton correspondent of one of the London papers, "attended at the Chapel Royal in the morning, and heard the Rev. Mr. Anderson, who preached, while the Rev. Mr. Hale read prayers."

**Fontana.**—This celebrated engraver, who was a pupil of Raphael Morghen, died at Rome, on the 18th ult. in his 74th year.

### LITERARY NOVELTIES.

Bibliotheca Scholastica; or a Scholastic Dictionary, describing the manners, customs, institutions, &c., of the ancient Egyptians, Assyrians, Greeks, Romans, Normans, &c., by P. A. Nuthall, LL.D., translator of Juvenal, Horace, &c.

*In the Press.*

Divine Emblems, with Engravings, after the fashion of Master Francis Quarles, by Johann Abrecht.

### LIST OF NEW BOOKS.

CHARLES HENRY ADAMS.

### ADVERTISEMENTS,

Connected with Literature and the Arts.

**DIORAMA.**—Will positively be closed for the Winter Season on Saturday next, the 21st instant.

TO ARTISTS, TOURISTS, AND ADMIRERS OF THE FINE ARTS.

**PARLOUR'S PORTABLE SKETCHING-CASE, OR DELINEATOR,** is confidently recommended to the notice of all persons attached to the Molens of Drawing, as being indistinctly superior to the Camera Lucida, and all other instruments hitherto invented, for the purpose of Sketching. The Sketching-Case may be held in the hand, and a correct Drawing made of any object or landscape; or it may be attached to a table, in the same manner as the Camera Lucida. It is simple in its management, and does not exceed, in size, the common Sketching-Book. Manufactured for the Patentee, by Reeves and Sons, 130 Cheapside; may be had, also, of Smith and Warner, Marylebone Street, Piccadilly; Watkins and Hill, Opticians, Charing Cross; and at all other Opticians' and Artists' Repositories. Ladies and Gentlemen who have the Camera Lucida may have the Delineator affixed to their own stem.

**EDINBURGH REVIEW, No. CXXXIII.**

Advertisements for the forthcoming No. are requested to be sent to the Publishers on or before Thursday, October 19, and Bills on or before Saturday, October 21.

20 Paternoster Row, October 12, 1837.

**THE PERUSAL OF NEW BOOKS.**

The German and Prussian mode of circulating new Publications for perusal is adopted at Messrs. Saunders and Otley's extensive Establishment, Conduit Street, Hanover Square. Families, Book Societies, and Literary Institutions are supplied throughout England, Scotland, and Ireland.

A Prospectus of the Plan, Terms, &c. as a single letter, on application (post-paid) to Saunders and Otley, Publishers, Conduit Street.

**"THE BEAUTIFUL GRISSETTE"**

rose up when I said this, and, going behind the counter, reached down a parcel, and untied it. I advanced to the side over against her: they were all too large. The beautiful grissette measured them one by one across my hand. It would not alter the dimensions. She begged I would try a single pair, which seemed to be the least. She held it open; my hand slipped into it at once. "It will not do," said I, shaking my head. "No," said she, doing the same thing. — *Stern's Sentimental Journey.*

A highly finished Line Engraving by George T. Dox, Historical Engraver in Ordinary to his late Majesty William the Fourth, from a Picture by G. S. Newton, R.A., of the above subject, will shortly appear.

### ILLUSTRATIONS TO BYRON.

Just published, price 2s. 6d. No. VI. of the new and extended Series of

**THE BYRON GALLERY,**

with Descriptive Letter-press. "Adequately to describe the delicate beauty of these splendid plates, does not appear to be within the power of language." — *Imperial Magazine.*

Smith, Elder, and Co. Cornhill.

### BOOKS IN THE PRESS.

Preparing for immediate publication, in a vols. post 8vo. (Printed uniformly with the Life of Mrs. Hannah More) with Portraits, &c.

**MEMOIRS OF THE LIFE OF WILLIAM**

WILBERFORCE. By his Sons, ROBERT ISAAC WILBERFORCE, M.A. Vicar of East Farleigh, late Fellow of Oriel College; and SAMUEL WILBERFORCE, M.A. Rector of Brighton. These Memoirs are the result of a long and laborious study, during a period of fifty years, Mr. Wilberforce was accustomed to record his private sentiments and his remarks on the incidents of the day—from his correspondence with his distinguished contemporaries, Mr. Pitt, Lord Grenville, Lord Melville, Mr. Windham, Mr. Canning, Lord Liverpool, Lord Manchester, the Emperor Alexander, Prince Talleyrand, La Fayette, Jeremy Bentham, Dr. Currie, Dr. Burgh, Bishop Porteus, the Rev. William Mason, Dean Milner, the Rev. John Newton, the Rev. John Wesley, John Thornton, Esq., Henry Thornton, Esq., James Stephen, Esq., William Hay, Esq., Lady Waldegrave, Mrs. Hannah More, &c. &c. &c. John Murray, Albemarle Street.

**NIMROD'S NEW WORK, WITH THIRTY-NINE**

**SPLENDID ILLUSTRATIONS.** On the 1st of November will be published, in 1 vol. Imperial 4to. elegantly bound, with gilt edges, price Two Guineas; or with Proof Impressions of these Plates, on India paper, price Three Guineas.

**"SPORTING, by NIMROD."**

Embellished by 84 large and beautiful Engravings on Steel, and Fifteen Vignettes, illustrative of British Field Sports, from Pictures by R. Anderson, R.A., T. Gainsborough, R.A., A. Cooper, R.A., Charles Hancock, F. Lewis, and W. Barnard; with Literary Contributions by John Hamilton Reynolds, Esq., the Author of "The Comic Annual," the Author of "The Oak-leaved Shooting Code," the Author of "The Sportsman's Cyclo-pædia," &c. &c. &c. London: A. H. Baily and Co. 23 Cornhill.

**THE FAMILY LIBRARY.—A NEW VOLUME.**

Early in October will be published, in 1 vol. embellished with Engravings, price 3s. cloth boards.

**THE HISTORY OF THE BASTILLE AND**

its PRINCIPAL CAPTIVES, from the earliest Period. By R. A. DAVENPORT. Forming Vol. XLIV. of the "Family Library." London: Printed for Thomas Tegg and Son, 78 Cheapside; and may be procured, by order, of any other Booksellers in the United Kingdom.

New and illustrated edition of Campbell's Poetical Works, uniform with Rogers's Poems, and "Italy."

On the 1st of November will be published, in 1 vol. illustrated by Vignettes, from Designs by Turner, price 20s. boards.

**THE POETICAL WORKS OF THOMAS CAMPBELL.**

Edward Moxon, Dover Street.

Early in November will be published, in 18mo., embossed roan, price 4s. 6d., illustrated with beautiful Engravings on Steel and Wood, by Williams, Hewison, Orren Smith, and others, from Drawings expressly for this Work, by Montague Stanley, Esq.

**THE EXCITEMENT FOR 1839;**

Edited by the Rev. ROBERT JAMIESON,

Minister of Westminster.

Being the Ninth Series.

\* Several of the previous volumes have been reprinted, and may be had by application to the publisher, or through the medium of any bookseller. John Johnstone, Hunter Square, Edinburgh; and Simpkin, Marshall, and Co., London.

### BOOKS PUBLISHED THIS DAY.

With upwards of Two Hundred Woodcuts, handsomely bound, price 7s. 6d.

**PETER PARLEY'S UNIVERSAL**

**HISTORY FOR THE YOUNG, on the Basis of Geography.**

This work, an entirely new production of its highly popular Author, is reprinted from an unpublished copy, especially forwarded by him for the purpose. In adapting it for the English Public, great pains have been taken to avoid those national peculiarities which his earlier works have been disapproved of, preserving, at the same time, his attractive style and felicitous manner of conveying instruction. This genuine English edition will, therefore, it is confidently believed, be found an invaluable addition to our educational works, and prove every way worthy of the confidence of parents and teachers. London: John W. Parker, West Strand.

By whom are also published,

A great variety of School-Books; Books of Instruction and Amusement for Young Persons; and Select Books for Children.

### IMPORTANT WORKS ON NATURAL HISTORY.

### REVIEW OF NEW BOOKS.

*The Poetical Works of Robert Southey, Collected by Himself.* In 10 vols. Vol. I. London, 1837. Longman and Co.

WE are very glad to see the works of a poet for whom we have always felt the warmest admiration, collected, and in a shape which will ensure their popularity. We shall reserve the criticism which their progress will suggest, till we come to those nobler efforts of which *Joan of Arc* is chiefly valuable as the precursor. The spirit in which the preface is written is, at once, so touching and so high-minded, that we cannot but quote it.

"Now, when about to perform what, at my age, may almost be called the testamentary task of revising, in all likelihood for the last time, those works by which it was my youthful ambition 'to be for ever known,' and part whereof I dare believe has been 'so written to aftertimes as they should not willingly let it die,' it appeared proper that this poem, through which the author had been first made known to the public, two-and-forty years ago, should lead the way; and the thought that it was once more to pass through the press under my own inspection, induced a feeling in some respects resembling that with which it had been first delivered to the printer,—and yet how different! For not in hope and ardour, nor with the impossible intention of rendering it what it might have been had it been planned and executed in middle life, did I resolve to correct it once more throughout; but for the purpose of making it more consistent with itself in diction, and less inconsistent in other things with the well-weighed opinions of my maturer years. The faults of effort, which may generally be regarded as hopeful indications in a juvenile writer, have been mostly left as they were. The faults of language, which remained from the first edition, have been removed; so that, in this respect, the whole is sufficiently in keeping. As for those which expressed the political prejudices of a young man who had too little knowledge to suspect his own ignorance, they have either been expunged, or altered, or such substitutions have been made for them as harmonise with the pervading spirit of the poem; and are, nevertheless, in accord with those opinions which the author has maintained for thirty years through good and evil report, in the maturity of his judgment as well as in the sincerity of his heart. I have thus acknowledged all the specific obligations to my elders or contemporaries in the art, of which I am distinctly conscious. The advantages arising from intimate intercourse with those who were engaged in similar pursuits cannot be in like manner specified, because in their nature they are imperceptible; but of such advantages no man has ever possessed more or greater, than at different times it has been my lot to enjoy. Personal attachment first, and family circumstances afterwards, connected me long and closely with Mr. Coleridge; and three-and-thirty years have ratified a friendship with Mr. Wordsworth which, we believe, will not terminate with this life, and which it is a pleasure for us to know will be continued and cherished as an heir-loom by those who are dearest to us

both. When I add what has been the greatest of all advantages, that I have passed more than half my life in retirement, conversing with books rather than men, constantly and unwearably engaged in literary pursuits, communing with my own heart, and taking that course which, upon mature consideration, seemed best to myself, I have said every thing necessary to account for the characteristics of my poetry, whatever they may be. It was in a mood resembling in no slight degree that wherewith a person in sound health, both of body and mind, makes his will and sets his worldly affairs in order, that I entered upon the serious task of arranging and revising the whole of my poetical works. What, indeed, was it but to bring in review before me the dreams and aspirations of my youth, and the feelings whereto I had given that free utterance which, by the usages of this world, is permitted to us in poetry, and in poetry alone? Of the smaller pieces in this collection, there is scarcely one concerning which I cannot vividly call to mind when and where it was composed. I have perfect recollection of the spots where many, not of the scenes only, but of the images which I have described from nature, were observed and noted. And how would it be possible for me to forget the interest taken in these poems, especially the longer and more ambitious works, by those persons nearest and dearest to me then, who witnessed their growth and completion? Well may it be called a serious task thus to resuscitate the past! But, serious though it be, it is not painful to one who knows that the end of his journey cannot be far distant, and, by the blessing of God, looks on to its termination with sure and certain hope."

This is written in the true spirit of a great poet—lofty, earnest; conscious, and yet modest. We promise ourselves great pleasure in going over the ballads, which Southey carries, we think, to perfection; and the magnificent oriental creations. The volume itself is elegant-looking, with a spirited portrait of the author, and an exquisite vignette.

*Forget Me Not: a Christmas, New Year's, and Birthday Present, for 1838.* Edited by Frederick Shoberl. 12mo. pp. 360. London, 1838. Ackermann and Co.

THIS is an old favourite with the public, and deservedly so, for it is always among the prettiest of its class. One poem has struck us so much this year that we give it entire.

"*The Rich and the Poor*, by Mary Howitt.  
Go, child, and take them meat and drink,  
And see that they be fed;  
Alas, it is a cruel thing,  
To lack of daily bread!  
Then, come, that I may speak to thee  
Of things severely true;  
Love thou the poor, for Jesus Christ,  
He was a poor man, too!  
They told me, when I was a child,  
I was of English birth;  
They called a free-born Englishman  
The noblest man on earth.  
They bade me say my lisping prayers  
Duly both night and morn;  
And bless the Father of the world  
That I was English born.

My home it was a stately place,  
In England's history known;  
And many an old renowned deed  
Was graven on its stone.  
I saw the high-born and the poor  
Low bending, side by side,  
And the meek blabop's holy hands  
Diffuse his blessing wide.  
And round and round the sacred pile,  
My reverent fancy went,  
Till God and good King George at once  
Within my heart were blent.  
Those were my years of innocence,  
Of ignorance and mirth;  
When my wild heart leapt up in joy  
Of my pure English birth.  
Oh, England, mother England!  
Proud nurse of thriving men,  
I've learnt to look with other eyes  
On many things since then.  
I've thus been taught: I saw a man,  
An old man, bent and hoar,  
And he broke flats upon the road  
With labour long and sore.  
The day it was a day in June;  
The nightingales sang loud,  
And with their load of snowy bloom  
The hawthorn-trees were bowed.  
The very highway side was bright  
With flowers; the branches made  
Of tenderest green, above my head,  
A pleasant summer shade.  
The earth, the air, the sunlit sky,  
Of gladness they were full;  
My heart rejoiced: when there I heard  
Laborious sounds and dull.  
They were the old man's hammer-strokes  
That fell upon the stone,  
Stroke after stroke, with bootless aim;  
Yet kept he striving on.  
I watched him: coach and chariot bright  
Rolled past him in their speed;  
Horsemen and peasants to the town;  
And yet he took no heed.  
Stroke after stroke, the hammer fell  
Upon the selfsame stone;  
A child had been as strong as he,  
Yet he kept toiling on.  
Before him lay a little heap  
Of flints he had to break;  
It wearied me but to conceive  
What labour they would take.  
I watched him still; and still he toiled  
Upon the selfsame stone;  
Nor ever raised his head to me,  
But still kept working on.  
'My friend,' said I, 'your task is hard,  
And bootless seems your labour;  
The strokes you give go here and there;  
A waste of power, good neighbour!'  
Upon his tool he propped himself,  
And turned on me his eye,  
Yet did not raise, the while, his head,  
Then slowly made reply.  
'The parish metes me out my work;  
Twelve pence my daily fee;  
I'm weak, God knows, and I am old,  
Four-score, my age, and three.  
Five weeks I could not strike a stroke,  
The parish helped me then;  
Now I must pay them back the cost;  
Hard times for aged men!  
I have been palsied, agued, racked  
With pains enough to kill;  
I cannot raise my head, and yet  
I must keep working still;  
For I've the parish loan to pay;  
Yet I am weak and ill!'  
Then, slowly lifting up his tool,  
The minute-strokes went on;  
I left him as I found him first,  
At work upon that stone.  
The nightingales sang loudly forth;  
Joy through all nature ran;  
But my very soul was sick to think  
On this poor Englishman.  
Again: it was the young spring-tide,  
When natural hearts overflow  
With love, to feel the genial air,  
To see the wild flowers blow.

And near a mighty town I walked  
In meadows green and fair;  
And, as I sauntered slowly on,  
A little child came there.

A child she was of ten years old,  
Yet with no mirth of mien;  
With sunken eye and thin pale face,  
And body dry and lean.

Yet walked she on among the flowers,  
For all her pallid hue;  
And gathered them with eager hands,  
As merry children do.

Poor child! the tears were in mine eyes,  
Her thin, small hands to see,  
Grasping the healthy flowers that looked  
More full of life than she.

'You take delight in flowers,' I said,  
And looked into her face;  
'No wonder, they are beautiful;  
Dwell you a-near this place?'

'No,' said the child, 'within the town  
I live, but here I run,  
Just for a flower at dinner-time;  
And just to feel the sun.

For, oh, the factory is so hot,  
And so doth daze my brain;  
I just run here to breathe the air,  
And then run back again.

And now the fields are fresh and green,  
I could not help but stay,  
To get for Tommy's garden-plot  
These pretty flowers to-day.'

'And Tommy, who is he?' I asked.  
'My brother,' she replied;  
The factory wheels they broke his arms,  
And sorely hurt his side.

He'll be a cripple all his days,  
For him these flowers I got;  
He has a garden in the yard,  
The neighbours harm it not;  
The drunken blacksmith strides across  
Poor Tommy's garden-plot.'

As thus we talked, we neared the town,  
When, like a heavy knell,  
Was heard, amid the jarring sounds,  
A distant factory-bell.

The child she made a sudden pause,  
Like one who could not move;  
Then threw poor Tommy's flowers away,  
For fear had mastered love.

And with unnatural speed she ran  
Down alleys dense and warm;  
A frightened, toiling thing of care,  
Into the toiling swarm:

Her scattered flowers lay in the street  
To wither in the sun,  
Or to be trod by passing feet;  
They were of worth to none;

The factory-bell had cut down joy,  
And still kept ringing on!

Proud was I when I was a child,  
To be of English birth,  
For surely thought the English were  
The happiest race on earth.

That was the creed when I was young,  
It is my creed no more!  
For I know, we're men, the difference now  
Betwixt the rich and poor!"

There are some very spirited poems by Mrs. L. H. Sigourney. Among the prose stories, we would particularly mention Earl Warwick's "Seal Ring," by Miss Lawrence, and "Coralie," by H. F. Chorley. We regret that it is too long for quotation.

*The Book of Gems. The Poets and Artists of Great Britain.* Edited by S. C. Hall. 8vo. pp. 304. London, 1838. Saunders and Otley. Mr. HALL has executed a difficult task with great industry and much good taste. The selections give generally an excellent idea of the poets, as far as fragments can do, still we miss one or two established favourites; for example, Lamb's old familiar faces. The following are specimens of how the biographies have been executed:—

"Robert Pollock was born in 1799, at Eaglesham, in Renfrewshire,—where his parents were occupied in agricultural pursuits. He gave early promise of the ability for which he was afterwards distinguished, and his friends determined to educate him for the church. He as, accordingly, entered at the University of Glasgow, where he applied himself with ardour

to the study of theology; but had scarcely commenced the exercise of his professional duties, when his health became so seriously impaired, that a visit to the south of Europe was recommended as the only means of preserving his life. In August 1827, he quitted Scotland, and proceeded to Southampton, with a view of emigrating for Italy. His malady, however, continued to increase; and in the September of that year he died, at Shirley Common. His early death is to be lamented; for probably a wider intercourse with mankind would not only have matured his natural talents, but would have produced a healthier state of mind as well as body. 'Retired in voluntary loveliness,' he saw only that which is cheerless in nature, and depressing in religion:—

'To pleasure deaf,  
And joys of common men, working his way  
With mighty energy, not uninspired,  
Through all the mines of thought; reckless of pain,  
And weariness, and wasted health.'

Soon after the death of the writer, his poem, 'The Course of Time,' attracted very general attention. He had previously published two stories in prose, 'Ralph Gemmet,' a tale for youth, and 'The Persecuted Family,' a narrative of the sufferings of the Presbyterians, during the reign of Charles the Second. He was, however, beyond the influence of criticism, when his book became largely the subject of it. It has been highly lauded—we think too highly; and find it difficult to account for the popularity it has obtained. The poem is in blank verse; and is nearly as long as the 'Paradise Lost.' Its aspect is, therefore, uninviting; yet that it has been extensively read cannot be doubted,—several editions having from time to time appeared. If we may not describe the author as of a sickly mind, we perceive abundant proof that he was of a diseased constitution. He arrays religion in dark robes, and considers it unnecessary to portray her features as both gentle and beautiful. 'Her ways are ways of pleasantness, and all her paths are peace.' The poet, however, exerts himself to shew how rugged he can render the one, and how gloomy he can make the other. His volume, from beginning to end, is an awful picture of wrath and vengeance; it contains little to cheer, and nothing to gladden; and would tempt the reader to imagine that man was created only to be tormented. Such is, unhappily, too much the mode with poets who occupy themselves with the treatment of sacred subjects. Instead of striving to direct and control, they labour either to subdue or crush the natural sensations and desires of man. They, therefore, clip the wings of their own fancy; and, if they soar, it is with the painful flutter of a wounded bird. Religious poetry is, for the most part, prejudicial to the cause it professes to advocate. It may influence the head; but it rarely touches the heart. Men are drawn from low thoughts and vicious habits, far less by fear than persuasion. If religion be in 'gorgon terrors clad,' and 'circled with a vengeful band,' the effect produced must be unnatural and transitory. The poets, therefore, who so introduce, never recommend it. Such a course is to be deprecated the more, because the very opposite is so accessible. The best auxiliaries to piety are abundant throughout nature; the themes that most readily present themselves to the poet are those which, by the surest and safest way, lead the heart to virtue,—and they are all graceful, and beautiful, and cheerful. There are, undoubtedly, many glorious exceptions to the rule we have ventured to lay down; but we believe they are not to be found among writers who have exclusively devoted them-

selves to the treatment of religion, in verse. Religion, therefore, is deprived of one of its most powerful and effective advocates. It is made most influential, indeed, by those who are indirectly its supporters—who describe natural objects, and excite love as well as veneration, by leading the mind through Nature up to Nature's God: 'the meanest flower that blows' has been made to teach a lesson; and he best instructs the reason, and directs the heart, who finds

'Good in every thing.'

"Charles Dibdin, the son of a silversmith, at Southampton, was born in that town, in the year 1745. At an early age he ventured to try his fortune in the metropolis, where he at once set himself to compose songs and ballads; but was occupied chiefly in tuning piano-fortes. In 1762, he made his *début* as an actor at the Richmond theatre; and two years afterwards appeared on the London boards, as Ralph, in the 'Maid of the Mill.' He soon began to write for the stage; and, it is said, produced above one hundred dramas, of various degrees of merit. The 'Deserter,' brought out in 1772; the 'Waterman,' in 1774; and the 'Quaker,' in 1775, are still occasionally performed. Dibdin, however, did not like his profession; and took the earliest opportunity of quitting it. He opened a kind of theatre in Leicester Square, to which he gave the title of 'Sans Souci,' and had evening entertainments, at which he sung his own songs, and accompanied himself on the piano:—this simple design was amazingly successful. He is said to have written from time to time, during the period of the performances, above twelve hundred songs, to nearly all of which he composed the music. He died in indigent circumstances, in 1814. In 1803, a pension of 200*l.* a-year was granted to Charles Dibdin; after enjoying it for three years, a new administration, in order to display the economical principles upon which it designed to manage Great Britain, thought proper to deprive the aged vocalist of this resource. Other branches of his family have displayed talents of no common order, and have, we believe, also had to encounter adversity. As yet, we have manifested no desire to repay any portion of the large debt which is owing to him from a nation. The country has been recently called upon to grant annuities to professors of literature, whose claims are not half so urgent, or so just. We may hope that some part of the debt to Charles Dibdin will yet be discharged. In estimating his merit as a nautical song writer, we should not confine it to the mere gratification derived by the sailors themselves from singing his songs: we find in the sentiments expressive of the character of seamen, so much kindness of feeling, and a total absence of selfishness and worldly wisdom, that has tended, in no small degree, to raise sailors in the esteem of the country, and to render the maritime profession popular. This consideration, during a period of protracted naval war, is essential, in order to arrive at a due estimate of the services conferred by Dibdin upon the state. A sound critic, Mr. Hogarth, states, that 'Dibdin had hardly received any musical education; and his attainments in heart were so small, that he had not skill enough to put a good accompaniment to his own airs. But he possessed a gift which no education or study can bestow—an inexhaustible vein of melody.' Among the hundreds of airs which he composed, it is wonderful to observe how few are bad, or even indifferent; and how free they are from sameness and repetition: and yet, with all this variety, there is no straining after novelty.

The airs flow so naturally, that they appear to have cost him no sort of effort. In their expression, too, they are not less various than in their phrases. Whether the poetry is tender, lively, or energetic, the music never fails to speak a corresponding language. If we try the poetry of Dibdin by a severe standard, it will undoubtedly be found wanting; but if it be a triumph of genius to achieve completely the object desired, we must allot a high station to the most popular song writer of the age. It is scarcely an exaggeration to say that 'a nation's ballads' have greater influence on its people than 'a nation's laws'; and it may be safely asserted, that the co-operation of Charles Dibdin has been largely effective in giving truth to the line,

'Britannia rules the waves.'

His songs come home to the uneducated minds of seamen: they are simple in language, and homely in construction. Refined and embellished, their effect would be lost. That they have had a prodigious—almost a universal—influence over our mariners, is certain: it has been as salutary as it is powerful. They teach that while courage is a noble quality, it is elevated into a virtue when exerted for our country; and that something more than brute force is necessary to make a good sailor. They not only inculcate bravery in battle, but patience under less exciting perils; and describe discipline and subordination as leading duties. They have been quoted with effect to suppress mutiny; they have, indeed, contributed largely to strengthen the great bulwarks of Britain—her 'wooden walls'—to raise the character of her best defender—the 'British tar'—and to establish that which is a substance, and not a sound—'British glory!'

"Letitia Elizabeth Landon was born in Hans Place, London. She is of the old Herefordshire family, of Tedstone-Delamere. Her father was, originally, intended for the navy, and sailed his first voyage as a midshipman, with his relative, Admiral Bowyer: he afterwards became a partner with Mr. Adair, the well-known army agent, but died while his daughter was very young. Her uncle, the Rev. Dr. Landon, is head of Worcester college, and Dean of Exeter. As we have heard her say, she cannot remember the time when composition, in some shape or other, was not a habit. She used in her earliest childhood to invent long stories, and repeat them to her brother; these soon took a metrical form, and she frequently walked about the grounds of Trevor Park, and lay awake half the night, reciting her verses aloud. The realities of life began with her at a very early period. Her father's altered circumstances induced her to direct her mind to publication: and some of her poems were transmitted to the Editor of the *Literary Gazette*, the first and the most constant of all her literary friends. He could scarcely believe they were written by the child who was introduced to him. 'The Improvisatrice' soon afterwards appeared, and obtained for her that reputation to which every succeeding year has largely contributed. In person Miss Landon is small, and delicately framed; her form is exquisitely moulded; and her countenance is so full of expression, that, although her features are by no means regular, she must be considered handsome. Her conversation is brilliant, and abounds in wit. Like most persons of genius, her spirits are either too high or too low: and those who have seen her only during her moments of joyousness, imagine that the sadness which too generally pervades her writings, is all unreal:

'Blame not her mirth, who was and yesterday,  
And may be sad to-morrow.'

One of her prose tales records the history of her childhood. It is but a gloomy one—and she treats it as the shadow of her after life. In a communication before us, she says, 'I write poetry with far more ease than I do prose, and with far greater rapidity. In prose, I often stop and hesitate for a word; in poetry, never. Poetry always carries me out of myself; I forget every thing in the world but the subject which has interested my imagination. It is the most subtle and insinuating of pleasures: but, like all pleasures, it is dearly bought. It is always succeeded by extreme depression of spirits, and an overpowering sense of bodily fatigue. Mine has been a successful career: and I hope I am earnestly grateful for the encouragement I have received, and the friends I have made,—but my life has convinced me that a public career must be a painful one to a woman. The envy and the notoriety carry with them a bitterness which predominates over the praise.' It has, perhaps, been her lot to encounter those best of friends—enemies—on her path through an eventful life; but she has the affection, as well as the admiration, of many; and her own generous and ardent zeal in forwarding the interests of those she regards, has not always been met with indifference or ingratitude. Miss Landon has been nearly all her life a resident in London. Her poetry, therefore, dwells more upon human passions, desires, and enjoyments—the themes and persons that history has rendered sacred—the glorious chivalries of gone-by ages, and the ruins of nations,—than upon the gentler topics, objects, and characters which those who live in the country, cherish, venerate, and love. It is to be lamented, that her intimacy with nature has been so limited and constrained, and that the scope of her genius has been therefore narrowed. The sources of her fame have, however, been numerous and productive; and her poems have obtained a popularity scarcely second to that of any British writer. She not only obtained a reputation—she has sustained it; it is acknowledged and appreciated wherever the English language is understood. When she quitted the less substantial topics in which her early youth delighted, for themes more worthy of the muse, she proved the strength of her mind; as well as the richness of her fancy; and her latter productions are unquestionably her best. The extent of her labour is absolutely startling. A large proportion of her poems remain scattered through various periodical works: we believe, if collected, they would form a greater number of volumes than those already published; and her writings in prose are records of her industry, no less than of her genius."

It is obvious that kindness, rather than criticism, must be the prevailing spirit of these memoirs. Our own literary views are totally different, on many points; but it is giving Mr. Hall the highest credit when we say that he has executed his task in the best possible feeling. As a whole, *The Book of Gems* is a delightful volume.

*Flowers of Loveliness for 1838.* Twelve Groups of Female Figures, emblematic of Flowers: designed by various Artists: with Poetical Illustrations, by L. E. L. London, 1838. Ackermann and Co.

THESE pretty and fanciful subjects have called forth all that is most fanciful and pretty in Miss Landon's style. Some of the poems are among the best that we have seen—so musical

and so touching. We give, first, the dedication to our young queen, which is a very triumph of poetical ingenuity.

"To Victoria.

Violet, grace of the vernal year!  
Offer'd be thou to this spring-like reign!  
Is not thy tint to that ladye dear,  
Whose banner of blue is the lord of the main?

Ivy we twine of changeless green,  
Constant for ever in leaf and bough;  
So may the heart of our maiden queen  
Be always verdant and fresh as now.

Garation, laced with many a streak  
Of blooming red on its leaflets bright,  
May be a type of her mantling cheek,  
Bleat with a brow of pearly white.

Tansy, though humble an herb it be,  
Look not upon it with scornful eye;  
On virtue, that lurks in low degree,  
A glance should fall kind from those on high.

Oliver, thy branch, dove-borne o'er the foam,  
Was a sign for the surges of death to cease;  
So, from the lips of our dove should come  
The soft but the sure command of peace.

Roses of England, ceasing from fight,  
Twine round her brow in whose veins are met  
The princely blood those roses unite  
'In the veins of the noblest Plantagenet.'

Iris, to thee the maid of the bow,  
That promises hope, her name has given;  
Join, then, the wreath at her feet we throw,  
Who beams as a symbol of hope from heaven.

Anemone, flower of the wind! is the last  
We call,—and our garland is now complete:  
Gentle the current, and soft be the blast,  
Which Victoria, the queen of the ocean, shall meet!"

"The Poppy.

Pale are her enchanted slumbers;  
Pale is she with many dreams;  
That white brow the turban cumbers;  
Wan, yet feverish she seems.  
Not the fountain's silvery flowing  
Lulls that haunted sleep;  
Round her are wild visions growing,  
Such as wake and weep.

Drugg'd is that impassioned sleeping,  
Sleep that is like life;  
By the unquiet pillow keeping  
Hope, and fear, and strife.  
Fast the fatal flower has bound her  
In its heavy spell;  
Strange wild phantasms surround her,  
But she knows them well.

First, there comes an hour Elysian,  
Would it might remain!  
Bringing back Love's early vision,  
But without its pain.  
Soft the myrtles of the wild wood,  
Round her path-way part;  
Happy, like a guileless childhood,  
With a woman's heart.

But a deeper shadow closes  
On those lovely hours,  
And the opening sky discloses  
Old ancestral terrors;  
There they stand—white, stately, solemn;  
While she looks, they fall!  
Round her lies the broken column,  
And the ruined wall.

Then, amid a forest lonely  
Does she seem to stray;  
One huge serpent, and one only,  
Seems to mark her way.  
Then begins her hour of terror:  
Strange shapes know their time—  
Struggling with some nameless error,  
With some unknown crime.

Phantoms crowd around, repeating  
Words that are of death;  
Loud her startled heart is beating,  
Louder than her breath.  
But a rosy lip has kissed her,  
With that kiss she wakes;  
Pale she gazes on the sister  
Who her slumber breaks.

Mighty must have been the sorrow,  
Passionate the grief,  
Which can thus a solace borrow,  
From that haunted leaf.  
Scarcely does the broken-hearted  
Draw a living breath;  
Better it were quite departed,  
Than this life in death."

"The Water-Lily.

Not 'mid the soil and the shadow of earth,  
Have we our home, or take we our birth;  
Keep ye your valleys that breathe of the rose,  
Where bndeth the myrtle: we reck not of those.

Low in the waters our palace we make,  
Where sweepeth the river, or spreadeth the lake;  
And the willow, that bends with its green hair above,  
Like a lady in grief, is the tree that we love.

At noon-tide we sleep to the music of shells,  
That we bring from the depths of the sea to our cells;  
Our cells that are roofed with the crystal, whose light  
Is like the young moon's, on her first summer night.

Strange plants are around us, whose delicate leaves  
No hue from the sunshine or moonlight receives;  
Yet, rich are the colours, as those that are given  
When the first hours of April are aëre in heaven.

There branches the coral, as red as the lip  
Of the earliest rose that the honey-bees sip;  
And above are encrusted a myriad of spars,  
With the hues of the rainbow, the light of the stars.  
Our streams are like mirrors, reflecting the ranks  
Of the wild flowers that blossom and bend on our banks;  
We give back their beauty—the face is as fair  
Of the rose in the wave, as it is on the air.

But the flower that we choose in our tresses to bind,—  
How long are those tresses when flung on the wind!—  
Is the lily, that floats on the shadowy tide,  
With a white cup that treasures its gold-stained inside.

The pearls that lie under the ocean are white,  
Like a bride's sunny weeping, whose tears are half light,  
And pure as the fall of the snow's early showers;  
But they are not more fair nor more pure than these flowers.

We float down the wave when the waters are red  
With the blushes that morning around her hath shed;  
And we wring from our long hair the damps of the night,  
The dew-drops that shine on the grass are less bright.

But alone, in the night, with the planets above,  
Or the silvery moon, is the hour that we love;  
Cold, pale is the light, and it suits with our doom,  
For our heart has no warmth, and our cheek has no bloom.

The night wind then bears our sad singing along;  
Ah! 'twixt him who shall listen the song,  
There is love in the music that floats on the air;  
But the mortal who seeks us, seeks death and despair.

The volume itself is a very handsome one. The rich scarlet binding is enough to warm a room without a fire, and to warm it in the prettiest possible manner.

*The Picturesque Annual for 1838.* By Leitch Ritchie, Esq. From Drawings by D. M'Clure, Esq. A.R.A. and T. Creswick, Esq. 8vo. pp. 264. London, 1837. Longman and Co.

*The Picturesque Annual!* what a misnomer! Why, it is a treatise on political economy! Page after page is given to workhouses, poor-laws, and all that we daily see in the "Morning Chronicle." Still there is much of truth and good feeling, throughout, of character in such a work. We shall give a few extracts of a more miscellaneous kind.

*Dreadful Fate of a Revenue Officer.*—"The establishment of the water-guard here, as elsewhere, was attended by one mistake, which, especially on a coast like this, diminished much of its efficiency. Instead of employing men who knew the coast, utter strangers were sent from England; and, for some time, smuggling went on as before. Lieutenant Leeds, however, the first chief of the guard, was a desperate fellow. He boarded smugglers of the largest class, and used his fire-arms freely. His fate was deeply tragic. One day, a fine American vessel, either not aware of the new coast police, or presuming upon its own giant strength, stood boldly into the bay, and fired two guns, either in warning or defiance. Leeds would not be warned, and determined not to be defied with impunity. He got a small smack, manned her with eleven stout fellows, armed with muskets, pistols, and cutlasses, and stood boldly out to sea. The twelfth man belonging to his force was too late to get on board; he had waited for a moment to dig a few potatoes for his wife, before embarking on the perilous enterprise; and, although the boat had only just left the quay when he reached the spot, Leeds swore that he should not be taken on board; but that, the moment he returned, he would have him broken. My informant heard the orders given by the lieutenant to his men,

which were, that they were to lie flat on the deck till they reached their prize, and then fire a volley, and board in the smoke. Onward bounded the adventurous smack, and in glided the haughty American to meet her. No strife, no struggling, no firing, told of the collision. The smack disappeared from the face of the waters, under her enemy's keel, and the smuggler continued her course into the bay, stately, and alone. Only one man rose: he was the owner of the smack, whom Leeds had tempted, with a large sum, to lend his vessel and his personal assistance. He succeeded in climbing up the chains, but his brains were immediately dashed out with a handspike. This victim's hat was found some time after on the opposite coast of Scotland, with his name inscribed in it.

*Cholera at Sligo.*—The Asiatic pestilence which raged same years ago in Europe, under the name of cholera, threatened to depopulate Sligo; and the precautions which it became necessary to observe by the surrounding country, almost deprived the inhabitants of every gleam of hope. A line was drawn round the devoted town, beyond which there was no escape; and those who attempted to fly were driven back, as if into a grave. Nothing was heard in the streets but sounds of lamentation and despair. Even the phenomena of external nature served for omens and predictions of evil. Some flashes of lightning had heralded the approach of the angel of the pestilence; but during his sojourn, a heavy cloud brooded over the town. Not a ray of sunshine was visible by day, and not a star by night. At this juncture, men naturally reverted to those feelings of religion which were before dimmed or deadened by the seductions of the world; and every hour of every day they found the refuge open for their admission, and the servants of the sanctuary at their post. Catholic, Protestant, Dissenter—were all alike the ministers of God. On this great day of judgment, there was not one priest of any denomination who shrunk from his perilous duty. Wherever their presence was required, there they took their stand; at the foot of the altar—at the bed of the dying—by the side of the new-made grave. Every heart confessed that death was not the master, but the agent of the dispensation; for, rising high above the sound of his footsteps, as he passed through the houses, came a voice from the many-portalled temple of the Lord Jesus Christ, proclaiming, 'Come to me, and I will give you life!' During the period of this visitation, only one clergyman—a Baptist minister—lost his life; while the physicians of the body were nearly all swept off. Besides these two classes, the authorities of the town did their duty well and bravely. Mr. Fausset, the provost, rode in every morning from the security of his country-house, with as great regularity as if all had been well, to visit the hospitals, bury the dead, preserve order in the street, and take his seat as president of the board of health. In spite of his unrelaxing labours, he, one morning, on reaching the town, saw the ground of the fever hospital covered with unburied corpses; and then, as he expressed it to me himself, he felt as if the end of the world were indeed come.

The board of health consisted at first of twelve members, who were rapidly diminished to seven. Nearly their whole duty, at last, was to grant coffins and tarred sheets for the dead bodies, and to see that the stock of those materials was kept up. One day, two poor little boys came to beg a coffin for their mother, and the provost, struck by their forlorn appearance, asked why their father had not come, who

would have been better able to carry it. 'We buried our father yesterday,' was the reply."

*Cause of Lord Mulgrave's Popularity.*—The agitator, in private life, is said to be a good, liberal, hospitable man. Politics are banished from his table, where men of all parties are received with the same cordial warmth: notwithstanding this, he has more personal enemies than any other man in Ireland; a circumstance which appears to me to imply a great want of that tact which should distinguish a political leader. Lord Mulgrave, on the other hand, although detested by certain party-men for his politics, is rarely passed over, even by them, without a good word. A friend of mine, whose politics ran so high that he declined being instrumental in giving the viceroy a public dinner, would cheerfully have bestowed three hundred and sixty-five dinners in the year upon Lord Mulgrave. The reason, no doubt, was, that his lordship, instead of boring the worthy provost with unwelcome topics, walked through the town with him, commenting on the numbers of pretty girls they passed. There is no doubt on my mind, that Lord Mulgrave is the best fitted for his post of all the men who ever held it."

We will, on no account, weaken the impression of his lordship's political gallantry, by any remarks of our own.

*Findens' Tableaux.* Edited by Mary Russell Mitford. Imperial 4to. pp. 56. London, 1837. Tilt.

WE cannot speak highly of the literary contents of this volume; they are of a very low order. Miss Mitford does not seem at home in such very fine society: she lacks the spirit and freshness of her own green lanes. Incomparably the best poem in the work is by an anonymous writer, with the initials E. B. B. We think that we have before seen them affixed to two exquisite ballads in the "New Monthly." We must give ourselves the pleasure of quoting it:—

"India, a Romance of the Ganges.  
They stand beneath the midnight,  
Beside the river-sea,  
Whose water sweepeth white around  
The shadow of the tree.  
The moon and earth are face to face,  
And earth is transected deep;  
The wave-voice seems the voice of dreams  
That wander through her sleep.  
The river floweth on.  
What bring they 'neath the midnight,  
Beside the river-sea?  
They bring that human heart, wherein  
No nightly calm can be—  
That droppeth never with the wind,  
Nor drieth with the dew—  
Oh, calm it, God! Thy calm is broad  
To cover spirits, too.  
The river floweth on.

The maidens lean them over  
The waters, side by side,  
And shun each other's deepening eyes,  
And gaze down the tide:  
And each within a little boat  
A little flame hath lit;  
If bright it move, the loved doth love,—  
And love doth fall with it—  
The river floweth on.

The stars are strong above us,  
To symbolize the soul:  
Whereby a tempest-wind may rush,  
Nor dim them as they roll.  
And yet the soul, by instinct sad,  
Doth stoop to symbols low—  
To that small flame, whose very name,  
Breathed o'er it, shakes it so.  
The river floweth on.

Go, little boats, go softly,  
And guard the symbol spark!  
The little boats go soft and safe  
Across the waters dark.  
And Luti's eyes have caught the fire  
They watch; and unawares,  
That blessed while, she lets a smile  
Creep silent through her prayers!  
The river floweth on.

The smile—where hath it wandered?—  
She riseth from her knee:  
She holds her dark, wet locks away—  
There is no light to see!  
She cries a quick and bitter cry—  
‘Nuleeni, launch me thine!  
We must have light abroad to-night,  
For all the wreck of mine!’  
The river floweth on.

‘I do remember watching  
A-neath this river-bed,  
When on my childish knee was laid  
My dying father’s head.\*  
I turned mine, to keep the tears  
From falling on his face—  
What doth it prove, when death and love  
Choose out the falsest place?’  
The river floweth on.

‘They say the dead are blessed,  
The death-change here receiving.  
Who say—ah, me!—do any say  
Where blessed are the living?  
Thy boat, Nuleeni!—look not sad—  
Light up the waters rather!  
I weep no faithless lover where  
I wept a loving father!’  
The river floweth on.

‘My thought was of his falsehood,  
Ere my flame had waxed dim!  
And though I closed mine eyes to dream  
That one last dream of him,  
They shall not now be wet to see  
The shining vision go.  
From earth’s cold love, I look above  
To the holy house of snow.†  
The river floweth on.

‘Come thou—thou never knewest  
A grief, that thou shouldst fear it—  
Thou wearest still the happy look  
That feels another’s near!‡  
Thy humming-bird is in the sun,‡  
Thy cuckoo in the grove;  
And all the three broad words, for thee,  
Are full of wandering love.’  
The river floweth on.

The little maiden cometh—  
She cometh shy and slow.  
I ween she seeth thro’ her lids,  
They drop a-down so low!  
Her tresses near her small feet bare—  
She stands, and speaketh nought,  
Yet blushes red, as if she said  
The name she only thought.  
The river floweth on.

She kneeled by the water—  
She lighted up the flame—  
And o’er her youthful forehead’s calm  
The trembling radiance came.  
Go, little boat! go, soft and safe,  
And guard the symbol spark!  
Soft, safe, doth float the little boat  
Across the waters dark.  
The river floweth on.

Glad tears her eyes have blinded—  
The light they cannot reach—  
She turneth with that sudden smile  
She learnt before her speech.  
‘I do not hear his voice; the tears  
Have dimmed my light away;  
But the symbol light will last to-night—  
The love will last for aye.’  
The river floweth on.

Then Luti spake behind her—  
Out spake she bitterly:  
‘By the symbol light that lasts to-night,  
Wilt vow a vow to me?’  
She gazeth upward in her face;  
Soft answer maketh she:  
‘By loves that last when lights are past,  
I vow that vow to thee.’  
The river floweth on.

An earthly look had Luti,  
Though her voice was deep as prayer.  
The rice is gathered from the plains,  
To cast upon thine hair.  
And when he comes, his marriage-band  
Around thy neck to throw;  
Toward his gaze thy bride-smile raise,  
And ask of . . . . . Luti’s wo!  
The river floweth on.

\* “The Hindoos carry their dying friends to the banks of the Ganges, believing in the after-blessedness of those who die there.”

† “The Hindoo heaven is localised on the summit of Mount Meru—one of the mountains of Himalaya, or Himmeleh, which signifies, I believe, in Sanscrit, the abode of snow, winter, or coldness.”

‡ “Hannadeva, the Indian god of love, is imagined to wander through the three worlds, accompanied by the humming-bird, cuckoo, and gentle breezes.”

§ “The casting of rice upon the head, and the fixing of the band or tali about the neck, are parts of the Hindoo marriage ceremonial.”

‘And when, in seasons after,  
Thy young bright-faced son  
Shall lean against thy knee, and ask  
What deeds his sire hath done;  
Press deep adown thy mother-smile  
Upon his ringlets long—  
View deep his pretty childish eyes—  
And tell of—Luti’s wrong!’  
The river floweth on.

She looked up in wonder,  
Yet softly answered she—  
‘By loves that last when lights are past,  
I vowed that vow to thee!  
But why glads it thee, that a bride-day be  
By a word of wo defiled—  
That a word of wrong take the cradle song  
From the ear of a senseless child?’  
‘Why!’ Luti said, and her laugh was dread,—  
Her laugh was low and wild—  
‘That the fair new love may the bridegroom prove,  
And the father shame the child!’  
The river floweth on.

‘Thou flowest still, O river!  
Thou flowest ’neath the moon—  
Thy lily hath not changed a leaf,\*  
Thy charmed lute a tune!  
He mixed his voice with thine—and his  
Was all I heard around!  
But now, beside his chosen bride,  
I hear the river’s sound!’  
The river floweth on.

‘I gaze upon her beauty,  
I feel her happy breathing:  
The light above thy wave is hers;  
And mine, the rest beneath them.  
Oh! give me back the dying look  
My father gave thy water!  
Give back! and let a little love  
O’erwatch his weary daughter!’  
The river floweth on.

‘Give back!’ she hath departed—  
The word is wandering with her,  
And the stricken maidens hear afar  
The step and cry together,  
O symbols! none are frail enow  
For mortal joys to borrow!  
While bright doth float Nuleeni’s boat,  
She weepeth, dark with sorrow!  
The river floweth on.”

The external appearance of the volume is most elegant.

*Pascal Bruno; a Sicilian Story.* Edited by Theodore Hook, Esq. 12mo. London, 1837. Colburn.

Now, what does this mean? Edited by Theodore Hook! We scarcely suppose Mr. Hook would be at the drudgery of a translation, not over well done; he does not even imply that he has. For what purpose, then, is his name given? Why, for that most important of all, figuring in an advertisement. It is just a piece of trickery and puffery, to which we wonder that he should lend himself. It is a complete specimen of the art of book-making. There is just material enough for an excellent periodical article, which it originally was; but large type, and Mr. Hook’s name, make a volume. *Pascal Bruno* is a translation of part of M. Alexander Dumas’s “*Impressions des Voyages*,” which first appeared in the “*Révue des deux Mondes*.” It is a clever bandit story, told with an animation and a reality, which especially characterises M. Dumas’s style. We give *Pascal Bruno*’s first appearance on the stage in the character of bandit. It is the wedding of the girl once betrothed to himself.

“As soon as the dessert was put down, and when the nuptial festivity was at its height, the doors of the palace were thrown open, and Gemma, leaning on the prince’s arm, preceded by servants bearing torches, and followed by their suite, descended the steps of the terrace, and proceeded to the banquet. The country-people were rising from their seats, when the prince motioned to them not to disturb themselves, and, with Gemma still leaning on his arm, his excellency began a tour round the tables, and concluded the ‘progress,’ by stopping before the newly married couple. A servant

\* “The Ganges is represented as a white woman, with a water-lily in her right hand, and in her left, a lute.”

took a golden cup to Gaetano, who, filling it with wine, presented it to Gemma. The beautiful countess, wishing the bride and bridegroom joy, touched the brim with her ruby lips, and handed the cup to the prince, who drank off its contents, and threw into it a purse of gold, which was carried to Teresa, as her wedding present. Shouts instantly arose of ‘Long live the Prince of Carini!’ ‘Long live the Countess of Castel-Nuovo!’ The esplanade was at this moment suddenly illuminated, as if by magic, in the midst of which the illustrious visitors withdrew, leaving behind them the light and joy of some bright vision, which had too quickly faded. These noble personages had scarcely entered the castle, with their attendants, before music was heard: the young folks left the tables, and hurried to the place allotted for dancing. Gaetano, according to the established Sicilian custom in such matters, prepared to open the ball with the interesting Teresa, whose beauty and grace of manner had been the subject of general admiration throughout the day. He approached her with the finished air of third-rate gracefulness—a sort of lively caricature of the best Sicilian cavaliers, and, in the highest possible spirits, solicited the honour of her hand. At that moment, a stranger presented himself on the esplanade, and stood in the midst of the company gazing upon the scene. The looks of the whole assembly were turned towards the new comer, who was dressed in the Calabrian costume, wearing pistols and a dagger in his belt; his jacket slung over one shoulder, like a hussar’s pelisse, left open to view his other sleeve stained with blood. Teresa saw him—she gazed on him for a moment—uttered a faint cry, and remained pale and motionless, as if she had seen a spectre. It was Pascal Bruno. Every eye was fixed on the uninvited guest; a dead and awful silence reigned. Every one present felt assured of the approach of some terrible catastrophe. Pascal, apparently unmoved by the sensation he had created, walked directly up to Teresa, and, standing before her, folded his arms, and fixed his piercing eyes on her pale countenance. ‘Pascal,’ said Teresa, in a faltering voice, ‘Pascal, can it be you?’ ‘Yes, Teresa,’ said Bruno, in a deep hollow voice, ‘it is I. I heard at Bauso, where I patiently and confidently waited your return, that you were to be married at Carini; so I came hither, and I hope am in time to dance the first tarantella with you.’ ‘I beg your pardon, sir,’ said Gaetano, coming up to him with a mingled air of anger and of gaiety, ‘that is the bridegroom’s right.’ ‘It is the right of the affianced one,’ said Pascal. ‘Come, my beloved Teresa, this is the least you can do for me after all I have suffered for you.’ ‘Teresa is my wife,’ said Gaetano, stretching forth his arm toward him. ‘Teresa is my betrothed,’ said Pascal, taking her hand. ‘Help! oh, help!’ said the wretched girl. The appeal was irresistible—the effect instantaneous. Gaetano seized Bruno by the collar—they struggled for a moment—that was all: in another instant Gaetano uttered a piercing cry, and fell dead at his feet. Pascal’s dagger was buried to the hilt in his breast. Some of the men who were nearest him, on the instant, rushed towards the murderer to secure him. Bruno stood unmoved, and, drawing one of his pistols from his belt, waved it over his head as a signal to the musicians, to strike up the Tarantella. They obeyed, as it were, mechanically. The rest of the company, paralysed by the suddenness and fearfulness of what had happened, remained motionless. ‘Come, Teresa, come, let us begin,’ said Pascal. Teresa

was no longer in possession of her faculties, she had become a creature demented by fear. She unconsciously yielded to his guidance, and this horrible dance, close to the corpse of the inoffensive murdered young man, was continued by the musicians to the last strain. Incredible as it may appear, no one stirred—no one spoke—it was something too terrific—something so unnaturally horrid, that nature itself seemed palsied. The moment the music ceased, as if it had been all that had excited and sustained her, the wretched Teresa fell fainting on the body of Gaetano. ‘Thanks, Teresa,’ said Pascal, ‘that is all I wanted; and now, if any man wishes to know me here, that he may find me elsewhere, I am Pascal Bruno.’”

Horrors enough, and there are more behind, to make the fortune of a dozen melo-dramas.

*The Taunus; or, Doings and Undoinings; being a Tour in search of the Picturesque, Romantic, &c. of the Taunus and the Donnersberg.* By Charles V. Inledon. 8vo. pp. 636. Mentz, 1837, Kirchheim and Co.; London, Black and Armstrong.

THIS is a strange rig-ma-role volume, neither German nor English in substance or style; neither prose nor poetry; but an odd compound of descriptions, antiquities, legends, and observations, altogether so eccentric, that the reader must be endowed with a large share of patience to be able to get through many of its pages. Never was the dukedom of Nassau so be-written about; its springs so be-praised; its scenery so be-paradised. But let us hear the author himself.

“An ardent love of nature first induced the wish to trace its beauties in this highly favoured land; historic records, pointing to the path victorious Drusus trod, or to the spot where valiant Hermann bled, propelled my willing steps; while loved romance (the very offspring of the soil) presented treasures to my view in saws and legends fairer than ever poet told or minstrel sung, to strew the path I wished to tread. Having to gain these different objects, made a pilgrimage exceeding a thousand miles, and thereby gratified my own desire, a question somehow or other arose, whether I should or should not make the result of my observations known to the public, for their amusement or information. \* \* \* Led by an amalgamation of feelings, gentle reader, long time I argued with the dread of failure, the frost of disappointment, the world’s rude censure, and the blight of my ambition, whether to give mankind the benefit or not of what experience had given me. ‘Shall I do it?’ said Vanity and Interest: ‘Shall I leave it undone?’ said Diffidence and Fear. ‘To do it or not to do it, that is the question?’ said Prudence; but long before the argument was brought to any close, the pros and cons had furnished me with a fair title to my work, and ‘Doings and Undoinings’ was resolved upon.”

As a sample of the work itself, we copy the following:—

“The celebrated plane-tree of Frauenstein stands at no great distance from the church, and, with its spreading branches, now supported by a framework of timber, occupies a considerable space. Beneath this gigantic tree, the growth of centuries, the good old folks of Frauenstein enjoy a shelter from the mid-day sun, while, midst its branches, each adventurous youth essays his skill, and braves his comrade to some act of daring which himself performs. In the modern literature of England no species of composition, perhaps, so completely unites æsthetic beauty with authentic information, as

those biographical and rhetorical essays denominated ‘The last Dying Speech and Confession,’ &c. which not unfrequently record the said oration, and recount the circumstances attending the last moments of the culprit, long before the first is delivered and the latter completed, having, to save time, been printed the night previous, that the curious in such matters might possess genuine information on the subject. Unfortunately, I could obtain no such authentic account of the ‘birth, parentage,’ &c. of the tree in question; but such as I could collect I give to my readers. ‘In blood was the plane-tree planted,’ was the reply of a peasant to a silver-headed sage, who, leaning on his staff, stood a moment to contemplate it. The wanderer’s cheek was pale as death as, in reply to his question, ‘How in blood!’ he learned that a cruel noble had, on the spot where grew the tree, slain the lover of his daughter; and that the maiden, before retiring to a convent to weep away her residue of life, had planted the tree, and left a small estate in the possession of a faithful domestic, that for the revenue of the same he should water and cherish the tree. It is told that, in the garden of the convent to which the fair Adelbertha retired, she planted, too, a plane-tree, beneath whose branches she wept away her miserable life: it is added, long was her pilgrimage of woe:—ladies loved more fervently in those golden days of constancy than now. So planted, it was matter of wonder to all, that the tree of Frauenstein should so flourish; yet wide it spread its branches over the soil, a fair and goodly tree, nor ever drooped its lovely head, save when the thoughtless robbed it of a branch, or wounded its venerable trunk; then from the lacerated member issued forth some drops of blood, and, as the aspen trembles in the gale, each leaf was seen to vibrate beneath the pain; but what, added my informant, is the most singular part of the business, is, that although the convent, rendered celebrated by the constancy of the lovely maid, was more than a hundred miles distant from this place, yet never bled the plane of Frauenstein but sure, by sympathy, the tree of St. Zepherina wept its tears of blood. They add, so profound was the grief of the latter tree at the death of the sorrowing nun, and so profuse the loss too of its vital fluid, that, in the same night it died away, and from its trunk they formed the narrow home of Adelbertha. The profane have felt disposed to doubt this fact; but, be it true or false, the tale affected him to whom it was related much, and, wiping from his eye a starting tear, the stranger left the spot, passed through the village, and, not till after a walk of two or three hours, and as day was drawing to a close, recovered from the deep dejection which the recital had produced. Pursuing his almost wayless path, as the shades of evening were fast drawing a mantle o’er the landscape, he met a lovely boy of about eight years of age, and inquired of him the road to the nearest house of refreshment, and where he could rest his weary limbs till morning’s sun should summon him again to toil. Music was in each tone and accent of the child, as he replied, ‘There is here no inn; but if you’ll share our frugal meal, my bed I’ll willingly resign to one so old and feeble, and watch with pleasure by your couch, for you are ill, I am sure you are.’”

So much for the grotesque sentimental: here is a fragment of plainer narrative.

“Shortly before arriving at Mentz, I was much surprised, and not a little alarmed, by the temerity of a youth who was swimming near the vessel, who, as it approached him,

dived immediately under the paddle, and made his reappearance at some considerable distance, in the rear of the steamer. A similar exploit is frequently performed by the expert swimmers here, who dive, one after the other, beneath the wheels of the mills in the Rhine, of which there are seventeen stretching far out in a line across a considerable part of the stream, close by the bridge of boats.”

As Mentz has lately flourished with a fête interesting to literature, it may, perhaps, amuse the reader to see how Mr. Inledon describes the origin of that city.

“When, long after the destruction of the world by the flood, the grandchildren of Noah dispersed through the different countries to people the earth, Magog, the second son of Japhet, took his direction northward. I should not have thought it necessary, so long after the decease of my hero, to expatiate at all upon his personal charms; but as custom has established the right, on the fairer part of the reading community, to be made acquainted with such matters, I shall briefly state, that, from such sources of information as are at present attainable, I find my hero was of majestic growth (some few feet taller than the degenerate present race), of carriage noble, and of unrivalled symmetry; fair, with blue eyes, aquiline nose, and long and flowing hair, which reached half down his manly form. A leopard skin, in graceful folds (they were more skilful furriers than now), fell from his shoulders, over his person to his knees; his legs and arms were bare. With no other weapon than a knotty staff; no companion, except two favourite dogs, two stags, and two roebucks, he departed from the home of his infancy, and wandered forth, to seek, in far and unknown climes, his future resting place. Thrice had the sun in splendour gone to rest; thrice, in his evening prayer, had the beloved of Ararat (whose mountain tops had vanished from his sight) been subjects of his benediction, when Magog’s heart began to sorrow for the joys he had left behind. On all around the might and majesty of the dread judge was seen; for every where the vestige of destruction marked the vengeance of the Lord—the remnants of the flood. No human being yet had cheered the wanderer’s sight. In this depopulated land he thought that he already felt the punishment of his rash oath; the quarrel with his brothers Maida and Jubal stung him to the quick; and, as he turned a sorrowing glance towards the green fields of his forsaken home, he ejaculated,

‘The angry vow, in haste and passion made,  
Is kept in sorrow, in remorse obeyed.’

With what pleasure would he have returned to the charge of the vine and olive-trees planted by his grandfather, could he have retraced his steps; that was impossible, and, with a heavy heart, he journeyed on. Marshes, rivers, rocks, and mountains, opposed the passage of the exile. Over silvery lakes, over gliding streams, over mighty floods, his sinewy stags transported him. Each herb, each berry, was essayed to nourish life; the mountain crag, or dismal cavern, was at night the outcast’s home; the northern blast, as further in the land he toiled, his thin-clad limbs with ague shook: he thought on Ararat, and sighed,—thought on his oath, never to return, and wept. He had wandered already nearly 300 days, when he arrived at a plot of high ground, over which the waters of the flood seemed not to have spent their fury. He felt convinced, too, of this fact, when a huge bear approached, the dimensions of whose frame most clearly proved it must have lived before the flood. Growling aloud, it neared, as if dis-

posed to seize him as its prey. With his strong arm, the grandson of great Noah felled the dread monster to his feet. From nipping cold its skin soon shielded Magog's form, and taught him that, even in the wilderness, the all-seeing eye of God perceives, and his beneficent hand protects and provides for his creatures. Animals, of every kind and species, now darted over his path; all nature seemed more smiling, more inviting; and, ere many days, he reached a spot where fruit and flowering trees, where corn and lovely shrubs, proclaimed the near abode of man. Huts in the distance, too, he spied; and, as his glaring eye-ball, strained to attain the anxiously desired object, at length, overjoyed, beheld a human being, the grateful man fell prostrate to the earth. Here, with uplifted hands towards heaven, and with a heart overflowing with delight and gratitude, he hid his fast-falling tears on the bosom of the earth, and poured forth his thanks in praise and adoration. Soon as the now delighted Magog rose from the earth, he was instantly perceived, and a lovely maiden, attended by an old man, whose silver beard reached to his middle, approached him. The pair surveyed him with surprise, but neared with confidence, and, taking his hand, the sage now led him towards the colony. Instantly he was surrounded by a group of the inhabitants, who, on some words uttered by the old man, seated themselves. He then held an address to the assembled people, which seemed to Magog to be a recommendation to them to receive with kindness the stranger; and then, addressing himself to the wanderer, evidently, by his gesticulation, bade him welcome. They then conducted him to a cottage, which was that of the ancient of the community. Here, after a meal of fruits and viands, a bed of leaves was prepared for him, and he retired for a refreshing repose. On the third day of his arrival, the people congregated with great shouts and clapping of hands, and with singing and other indications of rejoicing, at the cottage of the sage. Led by him, Magog ascended a hill at the back of his hut, where, decked with garlands of wild flowers, stood a rude altar, and near to it a still far ruder figure. A fire was soon kindled on the altar, and an animal placed alive upon the burning embers, which being at length consumed to ashes, the same were carefully collected, and laid at the feet of the wooden figure, before which all prostrate bent in silent adoration. The grief of the old man seemed great when he found Magog was not to be induced to bend before the god of their idolatry. Every fifth day this religious worship was pursued, all labour ceased, and the evening of the day was devoted to pleasure. Twice made the sun revolved around its axis ere Magog thought to quit the happy home of these simple people; but ere the first six months had passed, religion's dawning light had beamed upon their minds, and the insensate god, the carved work of man's hand, the creature of his own creation, had been consumed upon the altar erected to his worship. Content is not in man; Magog again forsook a happy home; again he wandered over inhospitable tracts, mid dismal solitudes, over mountain steepes, the rock's abyss, the waters of the lake, and over the desert's plain. At length he encountered a sight new to the astonished traveller. Majestic mountains, one more lofty than another, covered with snow, or glittering in the sun from ice, struck him with wonder and delight. But, like all worldly pleasures, short was the measure of his joy. Hunger deprived him soon, in this inhospitable clime, of each com-

panion of his weary way, except an only stag; and after wandering over these regions of sterility for several weeks, and bitterly repenting his departure from his friends in the peaceful vale, he arrived one day, suffering from fatigue and hunger, at a large and beautiful water, on the banks of which he found salutary and nourishing roots. After wandering many days on the margin of this lovely lake, he arrived at a part where a stream separates itself from the parent water. Magog followed the course of this stream, and the further he proceeded, the more lovely he found became the country through which it wound its course. He had journeyed on for near a moon, when he arrived at a part of this majestic river, on the banks of which the soil, teeming with all the beauties of nature, and luxuriant in her richest gifts, determined him to tarry for awhile. Another river, far less majestic, here mingled its yellow waters with the azure of the lovely stream. Outstretched beyond a plain of matchless beauty, a distant chain of mountains, whose summits seemed as pillars to uphold the canopy of heaven, bounded the prospect. Oh! it was a sight to cheer the wanderer's heart, and fill his mind with admiration. Magog, stretched at his length upon the ground, perfumed by every herb with which the bounteous hand of nature, lavish in her gifts to this highly favoured land, has blessed it with, surveyed each beauty with a lover's glance, and vowed this was his home. Just as the sun's last beams were sinking in the west, soft music, as it were to perfect quite the measure of the exile's joy, stole gently on his ear. He sprang upon his feet to ascertain from whence the dulcet sounds proceeded—sounds such as he never had heard before; but what was his astonishment when he beheld two heavenly forms, beings seemingly of another world, so perfect were the pair, seated in a chariot drawn by five milk-white stags, whose horns appeared of burnished gold. One of the nymphs with purple reins guided the flying stags, while from the other's skill, the music, which so entranced the youth, without an effort seemed to flow. No sooner did the pair observe the awe-struck stranger, than she who had produced the heavenly strains, dropping her instrument, drew forth a silver arrow, with which she was about to take her aim at the astonished Magog, when the amazon was restrained by her companion, who, guiding her carriage towards the stream, instant its waters separated, and the fiery stags darted headlong through the bed of the river. Before Magog had recovered from his astonishment, the lovely charioteer drew up before him. Both nymphs descended from their seats, and the skillful driver thus addressed the youth:—'Stranger, who art thou? whence comest thou? what doest thou in my father's realm? and what is the object of thy sojourn?' Entranced, the youth replied: 'Fair nymph, fain would I call thee by a name that must be foreign to my poor speech, for I can find no word to speak my wonder; my native tongue is bankrupt in expression of my admiration of thy matchless charms.' With a smile the fair one encouraged him briefly to relate his history; this done, he modestly inquired with what to him yet unknown deity he spoke: he thought till now there had been but one, and that, Great Nature, 'I am Maguntia, the daughter of the thousand year old Magnus, granddaughter of the most ancient Rheinus; but come, thou grandson of famed Noah, thou must visit with us the habitation of my father, thou shalt be welcome.' Instant the youth was by her side,

but ere he had time to think, he lost perception beneath the waters of the yellow stream. It was clear poor Magog was not formed for such a home, and the fair Maguntia, enamoured of the youth, hastened her lover to the surface of the deep, and thence, on shore. Beneath the fostering care of fair Maguntia, suspended animation soon returned; and, grieved to find her favourite could not inhabit with herself her watery home, she quick resolved to supplicate her father to erect on land a home for him, if he would consent to stay and share her love. Damsels were not so shy as now, or, beneath the waters of this stream, it is main sure they have constant leap-year. The offer was embraced with joy, and the fair one hastened to her indulgent father's palace, where fairies, fays, and fishes, dwell. Sleep sealed the eyelids of the enamoured youth, and dreams, such as happy lovers know, chased in creative fancy's form, through a night of bliss, the hours away, and when he awoke, his guardian angel, fair Maguntia, hung over his couch. His was a moment of delight; he heard the liquid words stream from the mouth of the water nymph, heard the confession of her love, he knew himself beloved, and his was bliss supreme. Fathers and grandfathers are in such moments sometimes unwelcome guests; so thought, no doubt, poor Magog, when sounds of music, breathed through a hundred horns of muscle-shells (different from ours of the present day, no doubt), announced the arrival of the ancient pair. Old Rheinus, with his son Manus, accompanied by thousands of tritons, left their watery palace to attend a feast given in honour of the stranger, lover of the daughter of the stream. The son of Noah was welcomed by the sages of the deep, from which, no doubt, has originated the saying, 'a deep one,' and the nuptials of Magog and Maguntia were solemnised with unheard of splendour. On this happy occasion Magog laid the foundation-stone of his future habitation; and, in a short period, around his costly palace, a town, unrivalled in its situation, stood, the proud erection of the tritons of the deep, and built of stones raised from the bed of its parent streams. For ages the town increased in its population and in splendour, till some barbarous nations, envious of its prosperity, attacked, and totally destroyed it. Some thousand years after, the warlike Romans, under the great commander, Drusus, overrunning the whole country, came to this spot, and, enchanted by a situation which reminded him of the pure climate of Italy, built, on the ruins of the town, the fair Maguntium, from Maguntia—the inhabitants of the neighbourhood still calling the ruins of the former town by that name."

*Jam satis*: if not more.

*The Landscape Annual*. Edited by J. Roscoe. 8vo. London, 1838. Jennings.

WE have elsewhere spoken of the pictorial embellishments; and the literary portion being principally compiled, does not require any very strict criticism. Mr. Roscoe is a very industrious writer, and has brought together a great deal of information respecting Spain and Morocco, still, the very self-complacent preface might have been spared.

#### LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

OXFORD.—On Saturday, the 7th inst. the Rev. A. T. Gilbert, D.D. Principal of Brasenose College, having been re-nominated Vice-Chancellor of the University, took the oath of office, in full convocation, and entered upon the duties of the vice-chancellorship for the second year, with the accustomed solemnities. The following heads of houses were afterwards nominated by the new vice-chancellor to act as pro-vice-chancellors during his ab-

science from the University, viz.:—Dr. Jenkyns, Master of Balliol College; Dr. Jones, Rector of Exeter College; Dr. Bridges, President of Corpus Christi College; Dr. Marsham, Warden of Merton College.

On Tuesday, the 10th, being the first day of Michaelmas Term, the following degrees were conferred:—

*Master of Arts*.—Rev. C. G. Owen, Queen's College.

*Bachelor of Arts*.—Rev. E. J. Gosling, Magdalen Hall.

CAMBRIDGE.—On Tuesday, the 10th inst. the following gentlemen were elected University Officers:—

*Proctors*.—Rev. E. Barnes, M.A. Christ's College; Rev. J. H. Evans, M.A. St. John's College.

*Moderators*.—Rev. E. Stevenson, M.A. Corpus Christi College; Rev. Professor W. H. Miller, M.A. St. John's College.

*Scrutators*.—Rev. J. Saunders, B.D. Sidney Sussex College; Rev. G. F. Nicholas, M.A. King's College.

*Tutors*.—T. B. Burcham, M.A. Trinity College; Rev. R. Birkett, M.A. Emmanuel College.

At the same congregation, the degree of Master of Arts was conferred upon C. George, of St. John's College.

On Thursday, the 12th, the following gentlemen were appointed the caput for the ensuing year:—The Vice-Chancellor; G. Archdall, D.D. Master of Emmanuel College, Divinity; J. W. Geldart, D.C.L. Trinity Hall, Law; J. T. Woodhouse, M.D. Caius College, Physic; H. Arlett, M.A. Pembroke College, Sen. Non Regent; E. H. Browne, M.A. Downing College, Sen. Regent.

The Fitzwilliam syndicate have just issued the following report to the senate:—"That Messrs. Robert Hicks and Son, builders, have offered to complete the whole work of building the carcass of the Fitzwilliam Museum, according to the drawings and specification of Mr. Basevi, for the sum of 33,362*l*. The syndics, having compared this tender with the others which have been sent in, beg leave to recommend the senate to accept the same on the production of proper securities."

#### ARTS AND SCIENCES. THE BRITISH ASSOCIATION. SEVENTH MEETING: LIVERPOOL.

[Sixth and concluding notice.]

FRIDAY.—SECTION F.

DR. TAYLOR announced communications from the Attorney-General of New South Wales, respecting the colonisation of that country, and which would be laid before the Section at Newcastle.

*The Plague*.—Mr. Urquhart, late Secretary of Legation at Constantinople, read a paper 'On the Topography of the Plague.' He stated that, during his residence in Constantinople, in 1834, a case of plague occurred in the house in which he resided, and he was advised to leave the house, but refused. The sick person recovered, and no other individual was attacked. A native, at the time, had remarked to him that he ran no danger whatever, as his residence was in a quarter in which the plague never proved fatal; and the remark had caused him to inquire why it was that particular places were almost invariably free from, and others as almost invariably exposed to, the ravages of the plague. The result of his observations, which had been continued for three years, had led him to the conclusion that, if it did not owe its origin to, it was materially aggravated by, the proximity of the cemeteries to the towns and villages; and that its attacks were most likely to be felt in those places situated above, rather than below, the cemeteries. The plague, he had no doubt, owed its origin to atmospheric influences; for he had observed that the birds always deserted the places where it was raging. Again, wherever it existed, he had always found that a relative position between the cemetery and the spot existed. It was known that the Turks, from religious prejudices, buried their dead very near the surface; and the mephitic vapours which arose from a congregation of putrefying bodies, placed within two feet of the surface, no doubt tended to the extension, if they were not the cause, of the plague. In India, where it was the practice to burn the dead, and in Egypt, where it was the custom to embalm them, no such scourge was known. Mr. Urquhart apologised for having no data to offer to the society's notice; but he hoped that the fact of his having called their

attention to the subject, would lead to the prosecution of a more regular inquiry. The field was broad, and interesting both in a scientific and philanthropical point of view.

Mr. Wyse corroborated the statements which had been advanced by Mr. Urquhart. He himself had never passed the cemetery near the gate of Adrianople, in humid weather, without a distinct perception of effluvia. He hoped that a report on the subject would be made to government, by whom the necessary inquiries could be instituted with far greater facility and success than by any body of private individuals. It would be for them to draw up the necessary formularies, and to forward them to the secretary of state, that they might by him be sent to the various consuls. They would then have data whereon to ground an hypothesis.

Dr. Boyce observed, that this source of the disease had been overlooked by medical men; and the inquiry now proposed would be of great interest. Thanks were voted to Mr. Urquhart.

*Reclamation of Irish Bogs*.—Mr. Birmingham read a paper, 'On the Reclaiming of a Bog in the County of Galway, in Ireland, belonging to Lord Clonbrock, which had been under his management for Three Years.' He detailed the processes resorted to; gave a description of the implements employed; and shewed that, by a small outlay (amounting altogether to about 149*l*., and including 445*l*. paid in wages to some of the poorest of the neighbouring peasantry), a great portion of the bog, comprising above 100 acres, had been converted into good land, and had proved not only profitable to the landlord, but beneficial to the peasantry. Twenty small occupiers had now comfortable cottages on the tract. He observed, too, that 500 acres could be cultivated with the same machinery that they had for 100; which would, consequently, wonderfully reduce the acreable expense. When he said, it was considered that there were millions of acres of similarly reclaimable bog land in Ireland, and that there were in his country a million and a half of destitute people, it could not but be said that the subject was one which deserved some attention. He concluded by expressing a hope that such scientific gentlemen, who interested themselves in agricultural matters, would come forward with all the information they could give relative to the best description of manure to be employed on such land, as to what plants and vegetables were most suited to the soil, and what was the best method of draining it.

Mr. Wells, secretary to the Dublin society, mentioned the quantity of bog here and there reclaimed by the encroachments of the peasantry themselves, who settled on them like American squatters, and raised good crops of potatoes and oats. The owners of the bogs, however, were usually jealous of these locations, and either charged high rents or drove off the intruders. He had no doubt but immense tracts might be made profitable; and, also, much waste lands on the banks of rivers and streams, now utterly uncultivated.

Mr. Bird asked, whether, after three or four years, reclaimed bog-lands did not cease to pay their expenses?

Mr. Birmingham could only answer for the present, being the first year.

Dr. Granville stated that the question relative to manures, and the best mode of draining, had already been answered in Holland and Germany. He himself had been commissioned by a society of scientific gentlemen in London, to proceed to the Continent, to make inquiries,

and to supply all the statistical information he could procure on this subject. He had done so, and the results of his inquiries had been communicated in a report to the board of the Thames Improvement Company, in February, 1837, and ordered to be printed for circulation. In that report the answers to the questions would be found. The system pursued in Holland had been brought to such perfection, that they even reclaimed sand-hills; and, in many places, where originally there were only deserts, they had produced gardens; and in some cases the expenses had been covered by the produce of the first year.

*Commercial Products of India*.—The next paper which engaged the attention of the members, was a paper, by Colonel Sykes, 'On the Commercial Products of India.' He stated, that there existed in that country numberless articles of produce, many of which were at present used to a great extent in this country (imported from other countries), but could be procured thence at a much cheaper rate than they were now purchased at; others that could be substituted with advantage for articles of a much dearer description; and, again, countless others that were unknown and undreamed of in England, and which might enter with advantage amongst the articles of regular merchandise. The colonel mentioned the most important products, and referred commercial men, for fuller information, to a series of reports issued by the committee of agriculture and commerce of the Royal Asiatic Society. The articles which he enumerated were, Indian wool (the imports of which, we perceive from a return in one of the reports alluded to, was, in 1833, 303 cwts., and in 1836, 14,645 cwts.); a number of oil and cordage plants, of an extremely valuable character, and many of which are unnoticed in any price current; Indian rubber; wheats, which are of the very finest order; sugar, of which, he said, he had merely to observe that it could be produced to any extent that this country might require; cotton, which came from the heart of India, and which he hoped, by the formation of good roads, to see brought to the coasts in vehicles, and not, as at present, on the backs of bullocks; an article from the Deccan, which yielded an excellent dye; linseed-oil, which has been obtained from Calcutta, and is worth 15 per cent more to the crushers than that brought from Russia, hitherto our sole supplier; castor-oil, for which we formerly depended on the West Indies, but which now, instead of being confined to medicinal purposes, was used in various manufactures; mustard-seeds and rape-seeds—all of which yielded oil; cocoa-nut oil, the present price of which was 312 per cent above the cost price in Bombay; Bengal hemp, from which bags, twine, cordage, canvass, &c., were made in the east. The ropes made of this material, he added, suffered very little by immersion in water; and he stated, that all the paper in common use in the Deccan was manufactured from old and worn-out grain bags, and other articles, formed from the fibres of the Taag, or Bengal hemp. The colonel informed commercial gentlemen that they might become members of the Royal Asiatic Society by the payment of a guinea annually.

Upon this subject some very interesting conversation ensued; and the advantage of communicating with the Commercial and Agricultural Section of the Royal Asiatic Society was pointed out to the notice of Liverpool, and all commercial men.

*State of Crime in Liverpool*.—Mr. Joshua Walmaley then read a paper, 'On the State of

Crime in Liverpool.' The report gave, as the result of rigid inquiry (and underrated), a criminal population to this town of 4200 females and 4520 males; 2270 of the latter being professional thieves, and the remainder occasional thieves, living by a combination of labour and plunder; and the whole was set down at upwards of 700,000*l*. In the year 1835, there were taken into custody 13,506 persons, of whom 2138 were committed. In 1836, there were taken into custody 16,890, of whom 3343 were committed. Up to the 13th of the present month, the number taken into custody in eight months was 12,709, of whom 2849 were committed. From July 1835 to July 1836, the number of juvenile thieves, under 18 years of age apprehended was 924, of whom 378 were committed. From July 1836 up to the present day, the number of juvenile thieves taken into custody was 2339, of whom 1096 were committed. There were in custody, during the same period, upwards of 1500 well-known adult thieves. Returns of houses of evil repute were next given; and also another return, which, though not absolutely bearing on the subject, is not without interest. Of 419 individuals now in the gaol, 216 profess the religious creed of Church Protestants, 174 Roman Catholics, eight are Methodists, 17 are Presbyterians, two are Unitarians, one Baptist, and one Independent. 141 can neither read nor write, 59 read imperfectly, 38 read well, 127 read and write imperfectly, and 56 read and write well.

The report concluded thus:—"I have come forward at this time solely with the hope that the subject may be taken up by those able and willing to devise and carry into effect some means for the amelioration of the condition of so many of our fellow-creatures. The surveillance of a vigilant police unquestionably lessens the opportunities for the commission of crime, and leads to the quick detection of the offenders; but humanity requires that, while we take measures to punish, we should use means to reclaim. We should recollect that 'Of the means to do ill deeds make ill deeds done.'"

A good deal of discussion ensued; but the general accuracy of Mr. Walmaley's figures seemed to be unimpeached.

About two o'clock Lord Sandon vacated the chair, and terminated the business.

#### SECTION G.

*Printing for the Use of the Blind.*—Mr. Oliphant, of Edinburgh, spoke at considerable length in defence of an angular system of characters for the use of the blind. He quite agreed with the report, as to the inexpediency of introducing an arbitrary or stenographic character; but, in common with many gentlemen present, had felt disappointed that Mr. Taylor had not entered more fully into the merits of the systems of Mr. Alston, of Glasgow, and Mr. Gell, of Edinburgh. The former gentleman had adopted the Roman capital letters alone, which, in his opinion, were liable to very serious objections. They were all of the same height, and possessed the same general appearance—qualities which rendered them most applicable for titles and inscriptions, where diversity of form and size would be offensive, but which, in a tangible alphabet, were most of all to be avoided. Many of the distinguishing characteristics of the Roman capitals were in the centre of the letter, a position in which, when the size of the type was reduced, it was impossible for the sense of touch readily to distinguish the shape of the enclosed space. This opinion he exemplified by a comparison of various letters, such as H, N, M; X, Z; B, R; O, C, G, &c., whose

extreme points, being nearly in the same position, were alone perceptible to the finger when rapidly running along the line. Mr. O. stated various other reasons by which the Roman capital alphabet was rendered inapplicable for the blind; and expressed his conviction of the impracticability of reducing the size of the type at present in use at the Glasgow press, without impairing its tangibility. On the other hand, many of these difficulties was got over in the alphabets, as recently improved by Mr. Gell, a gentleman who, for many years past, had devoted much attention to making experiments on various characters. Most of the objections noticed in the report had reference to the angular letter in use some time back; but that they were now almost entirely obviated in the present form of the letters, which were now quite legible to the eye, without having lost any of that tangibility by which they were formerly distinguished. As a proof of the ease with which the angular modification of the small Roman alphabet could be read, he mentioned that, during the preceding week, he had witnessed the children attending the School for the Blind, in Edinburgh, reading with not less than eight and ten folds of a silk handkerchief interposed between their fingers and the embossed types; and that Mr. Gell, jun., by constant practice, had acquired such delicacy of touch, as to be able to distinguish letters cut upon a small-pica body, a size of type on which the common octavo Bible is frequently printed; and that he had little doubt but that in a short time, instead of a single Gospel in the raised letters occupying a quarto volume, that the whole New Testament would be contained within that compass. Mr. O. was proceeding to give further illustrations of the importance of introducing the small letter into any system which should receive the sanction of the British Association, by being recommended in its Report, when, at the suggestion of Dr. Carpenter, it was agreed that Mr. Oliphant should have an opportunity of communicating his remarks to Mr. Taylor, who was authorised to insert them, with any observations of his own, as an appendix to his report. Mr. Alston had the same privilege also conceded to him; and, after the thanks of the Section had been given to Mr. Taylor for his valuable report, the discussion was dropped.

Mr. Russell concluded his 'Observations on the Resistance of Waves,' &c.

*Duty of Cornish Engines.*—Mr. John Taylor, the manager of very extensive Cornish mines, and Mr. Lane, the keeper of the registers, attended by request to give further information on this highly interesting subject.

Mr. Taylor being asked if there was any doubt that the performance of a certain engine reached 125 millions, said, it was the general opinion in Cornwall, that no experiment made for so short a time was to be relied on. Their duty was taken on the average of the month. He found that, if the engine-man was warned, the flues, &c. well heated, and every thing got up in particular order, a very partial result would be obtained. The result of experiments altogether went quite to confirm Mr. Lane's estimates. Other experiments had been made for a few hours, and one had been attended by Mr. Lane; but practical men generally would not attend to those experiments, because they put no reliance on them.

Dr. Lardner said, the conclusiveness of the experiment was one thing, the fact another. Did the duty actually amount to 125 millions during it? Was Mr. Henwood right in conjecturing that the engines got up the steam

very high, and worked it out during the experiment?

Mr. Lane could fully answer in the negative for six hours before. He saw the coals cleared out; the fresh ones weighed; every thing locked up; and, though he put no reliance on the experiment, he had no doubt of its accuracy, so far as it went. He had no doubt the engine did do the duty of 125 millions. Its monthly average was below 100. The experiment continued twenty-six hours.

The conversation was protracted some time, and the experiments of Mr. Farey referred to. We have only room to state that, in answer to a question from Mr. Cliest, relative to leakage and loss of water, Mr. Taylor said that this mode of measuring the duty was proposed by Mr. Watt, merely as a standard of comparison between one engine and another, and no one supposed that the discharge amounted to the whole calculated amount. An experiment had actually been made, however, by measuring the water, and the difference did never affect the duty much. They do not say that the actual delivery is to the full amount; but they say that such is the weight of the column lifted.

*Thrust of Arches.*—The remainder of the morning was principally occupied by the reading of a paper, by Professor Mosely, on this subject.

Mr. Webster read a notice that it was intended to open classes in the new University of Durham for the education of civil engineers, which led to a *spree* between Dr. Lardner and Professor Robinson, by way of *finale*.

The Sections having broken up somewhat earlier than the accustomed hour of three o'clock, the point of attraction was soon seen to be the Botanic Garden; and thither the carriages of every description were wending their way, laden with the company invited to the *déjeuner à la fourchette*. The day seemed made expressly for the purpose; and the good folks of Liverpool were fortunate in having their handsome entertainment favoured by auspicious weather. The grounds are newly laid out on a much larger scale than the Gardens which preceded them, and offer ample room for botanical purposes. On the present occasion they were promenaded by several thousand well-dressed persons; and the effect was as striking as any thing of the kind we ever witnessed. The *déjeuner* itself, spread under an immense awning, was of a splendid description; and the profusion of the finest fruits, melons, grapes, pines, &c. left the vast numbers assembled nothing to wish for.

Indeed, like all the rest of the doings connected with the Liverpool reception of the Association, the treat was not only abundant, but magnificent, and conducted with admirable order.

*Evening Meeting at the Amphitheatre.*—In the evening, as previously arranged, a meeting took place at the Amphitheatre, at which gentlemen, appointed by the various Sections, made brief Reports of their Proceedings throughout the week. At former meetings similar reports were made every evening; or three or four times within the week; but this method of generalising the intelligence had been found to be troublesome and imperfect. In the hope of improvement, it was now endeavoured to combine the whole together, after the business was finished; but the plan, though interesting, was not eminently successful. The only way to obtain a perfect abstract and popular view of the circumstances must be to take notes of every day's work in every Section, and submit

them to the presidents for revision and correction; but even this might be in some instances faulty, in consequence of the presidents often leaving their own Sections to read papers or participate in the discussions of others; and thus breaking the thread of observation. The subject, however, will be considered before the next year, and the best machinery be applied to surmount the difficulties.

The Amphitheatre was crowded, and the *coup d'œil* extremely good; but as we have already reported every particular of the proceedings worthy of public attention, we need not follow the necessarily more meagre statements of the distinguished individuals who now appeared on the stage to perform the tasks allotted to them, but only refer to what appeared most new or interesting as coming from them.

Lord Burlington having taken the chair, Professor Peacock gave a very distinct account of the Papers, &c. in Section A., specifying those of the greatest importance. Among the latter were Mr. Lubbock's 'Observations on Tides,' respecting which Mr. P. particularly mentioned the remarkable coincidence between theory and observation; whence he confidently anticipated that the theory of the tides would soon be as accurately settled as that of any celestial phenomena. He also noticed the Report from Dr. Robinson on certain Lunar Observations, 6000 in number, and their coincidence with those of Mr. Pond, to the extent of 1-3000th part of a second. Having dwelt with just encomiums on Mr. Russell's, Sir W. Hamilton's, Professor Lloyd's, Mr. De la Rive's, and Mr. Harris's communications on Waves, Algebra, Optical Phenomena, Magnetism, and Tides respectively, he then adverted to Capt. Denham's experiments on Light-Houses more fully than we have done. Captain Denham, he said, had exhibited his proposed improvement in the construction of coloured light for light-houses. He had exhibited the red light, as produced in the usual manner; the same, as produced by a red globe; the same, as produced by a red cylinder. Many interesting and important remarks were made on the subject by Mr. Faraday and Sir D. Brewster; but, as the glasses were not identical, precisely, in structure, they could not pronounce conclusively on the merits of the invention; but, so far as appeared, the red light produced by Captain D.'s apparatus was of a very striking character. Professor Robinson, of Armagh, had sent a series of observations on the Parallax of the Fixed Star in Lyra. This, they were aware, was a most exciting and controverted subject. It was of the highest importance to astronomers—no less than to determine whether the fixed stars were within a distance, not such as could be conceived in miles—but even such as could be appreciated by philosophical instruments. Mr. Pond was against the existence of any appreciable parallax; Dr. Brinkney, a high name, thought the contrary. On the authority of Sir William Hamilton, it appeared that the observations at Dublin yet confirmed the latter. Dr. Robinson's observations were discrepant with those of Mr. Pond; and though many think the question settled, he (Professor P.) must still, under the authority of two such distinguished philosophers, consider it opened anew, but only, he trusted, to be settled for ever.

Mr. Peacock's address, which was remarkably clear, intelligent, and well delivered, having occupied thirty-five minutes, the chairman remarked on the expediency of the speakers limiting themselves, as nearly as possible,

to the time fixed (a quarter of an hour or little more), in order that the whole might be got through by a reasonable hour (it was now past nine o'clock); and called on Mr. Faraday for the Report of the Chemical Section B.

Mr. F. concluded amid great applause in eighteen minutes, and was succeeded by Professor Sedgwick for the Section of Geology, C; who, after a playful introduction, said, he would take the papers read at his section, not chronologically, but as they related to the stratifications, beginning with the superficial. First was a paper 'On the Motion of Glaciers;' then two by Mr. Yates and another gentleman, on an operation of which they unfortunately knew too much this week—the deposition of mud. Next came the paper of their distinguished townsman, Captain Denham, 'On the Navigation of the Mersey,' which shewed, as well as the records of great ports filled up by the like cause, the great importance of knowing something about mud. He had no time to go into the merits of this paper, but it did Captain Denham the highest honour. The learned professor proceeded through the subjects of gravel, fluviatile strata, and the new red sandstone; and the papers relating to those formations, until he came to the coal formation, and on that he noticed the numbers and value of the local contributions to the geology of South Lancashire, which he hoped was in some degree attributable to the influence of the Association. He alluded with much feeling to the accident at Workington, where a mighty coal-field, one of the hearts, as it were, of the country, was destroyed; but he was convinced that Providence, so kind to this country, had conferred on it coal-fields so vast, that thousands of years would not exhaust its enormous resources of fuel. He referred to the new fissures discovered by Agassiz in the Ludlow rock; and bestowed much praise on the labours of Mr. Gilbertson, of Preston. After passing through the limestone, the transition rocks, and touching on mineral veins, avowing his belief that the earth had existed for ages before man was created, the speaker wound up by a powerful vindication of the moral and religious tendency of the study of geology.

Professor Henslow gave an account of Section D. He analysed the most valuable papers, and touched on many interesting subjects. The most interesting fact he stated, was that relating to Mr. Crosse's experiments. Mr. Crosse discovered living animals in a solution of silica acted on by galvanism. Some people, not Mr. Crosse himself, said those insects were generated by galvanism; others, that they or their ova existed in the silica, and were set at liberty by the solution. Mr. Children, of the British Museum, Mr. Golden Bird, and another chemist, had all three repeated the experiment with the greatest attention to accuracy. All three came to the same conclusion—that they could produce no such animals. Further, entomologists had examined the specimens furnished by Mr. Crosse, and had decided that they were a well-known common and destructive little mite, and conjectured that the ova had been introduced in the distilled water, and developed by the galvanic action.

Dr. Roget, as president of Section E, gave an account of the successful attempt made in his section to identify the sounds given by the human heart with those produced by the percussion of fluids in common elastic tubes; and entered at length into a description of the stethoscope, which he illustrated by exhibiting forms and modes of applying the instrument. In conclusion, he observed that philosophers

were called cold and unfeeling, but from this it appeared that they had at last learned the language of the heart!

Lord Sandon (who was received with great applause) narrated the proceedings of the Statistical Section E, in one of the most concise and luminous addresses of the evening; but as we have pretty fully reported the leading papers, we shall here only speak in terms of perfect accord of the sound and judicious advice with which his lordship concluded. He noticed the near approach which the matters discussed in this Section made to prohibited topics, and earnestly exhorted its members to adhere to their past principles; to devote themselves to the elucidation of inquiries calculated to benefit their country, and their fellow-creatures; and to avoid the quicksands on which the introduction of religious opinions or political questions would infallibly wreck them.

Professor Robinson wound up the proceedings by an eloquent flourish of trumpets from Section F, Mechanics. If he were to attempt to detail all the results of the Section, morning would arise before their interest would be exhausted. The Association, first of all, had a Mathematical and Physical Section. It was not then conceived that the higher minds, which dwelt amid the sublimities of geometry, would find, not merely associates, but guides and teachers in their own science, among those on whom they looked down. But it was impossible that sound practical men could come into contact with such persons as Brewster and Whewell, without catching some portion of the fire which animated them. The seed had been sown, and the fruit had been not a hundred fold, but a thousand fold. The Section of Physics threw off that of Mechanical Science. Since then, the latter had attained a magnitude and interest which, if second to any, was second only to Geology. It had now the protection of the British Association, a Minerva, extending over it a shield, on which all the imbecile arrows of derision and mockery fell in vain. Long might the Society go on increasing in prosperity; and he who first conceived the idea of it would go down in history as a benefactor to the human race.

Professor Phillips then announced the appointments for excursions to-day, and at ½ past 11, *exeunt omnes*.

It was rather *mal-à-propos*, that the opening of the Mechanics' Institute was also appointed for this evening, as it prevented the attendance of many eminent persons. It was, nevertheless, opened in excellent style; above a thousand individuals being present, and the addresses delivered, and motions made, by men of great celebrity.

#### SATURDAY.

The only Section which met to-day was that of Geology, which sat for nearly two hours, till one o'clock, when the General Meeting was held.

Mr. Fox reported that he had obtained some slight indications of electric action in Sken's lead-mine, near Middleton, Teasdale; but that he was induced to believe, from the experiments which he had hitherto made in lead-mines, situated in limestone, and sandstone, that the electricity developed in them is much more feeble than it is in copper and some other veins, situated in the lower rocks, such as granite and killas. He also stated that he found the altered coal, or cluder, occurring contiguous to the great trap dyke in Durham, in Cockfield Fell Colliery, to be incapable of conducting Voltaic electricity; whereas common cinder is a good conductor—and so is the altered coal in ques-

tion, after exposure to heat sufficient to coke it. Hence it appears that the cinder of Cockfield Fell must have undergone some change, to deprive it of its conducting powers. He also reported the results of some experiments which had been made for him in Levant copper and tin mines, and the Consolidated Mines in Cornwall, by which it appears that thermometers, four feet long, and buried in holes three feet deep, which were filled round with clay, indicated, at the deepest parts of these mines, higher degrees of temperature than shorter thermometers, buried only one inch deep in contiguous holes. In Levant mine, at 200 fathoms below the sea level, and about 230 fathoms under the surface, the deep thermometer indicated a temperature of  $80^{\circ}$ , and the short one  $78\frac{1}{2}^{\circ}$ . Both were in granite, and four feet from the lode. This is equal to an increase of  $1^{\circ}$  for every 46 feet, calculating from the surface. In the Consolidated Mines, situated in killas, the deep thermometer indicated a temperature of  $85\frac{1}{2}^{\circ}$ , at 24 fathoms from the lode, and at the depth of 290 fathoms under the surface, or 237 fathoms under the sea level, half tide; which is in the ratio of  $1^{\circ}$  of increase for every 49 feet. The short thermometer, buried only one inch deep, near the same station, indicated a temperature of only  $84^{\circ}$ . At another place, only 10 fathoms from the lode, long thermometer,  $86\frac{1}{2}^{\circ}$ , short one,  $85^{\circ}$ ; and in the lode itself, former  $92^{\circ}$ , and the latter  $88^{\circ}$ . These experiments clearly prove that, in these cases, the temperature of the earth is not increased, but the reverse, by adventitious causes. Mr. Fox considers that the anomalous results of temperature obtained in mines is in great measure to be attributed to the greater or less facility which the rocks themselves afford to the circulation of water; the warmer portions of that fluid having always a tendency to ascend, and to convey heat upwards, more or less according to the nature and fissured state of the rock; and in this way he accounted for the temperature of granite being rather inferior to that of killas, at equal depths.

Mr. Elias Hall described, very minutely, the geological formations of Derbyshire, and exhibited an indented map of the county cut by himself. It was a model with all its diversities of hill, dale, and plain. The various mineral productions were shewn, with the position and direction of the strata of the earth, rocks, &c.

Mr. Hardman Phillips read an interesting paper 'On the prodigious Field of Bituminous Coal in Pennsylvania,' which, he said, resembled the Newcastle coal in all its valuable properties.

Professor Sedgwick, in one of his eloquent bursts, closed the proceedings of the week, and had the thanks of the Section, and of its crowd of fair auditors, voted to himself by acclamation.

At the amphitheatre in the evening, Mr. Murchison, the general secretary, read the report from the general committee, relative to the appointment of officers for the ensuing year, (given in our journal of the proceedings of the committee.) Though the Society was not blessed with any very rich endowments, yet it had spared, from the contributions of its philosophers, and of the humble aspirants for scientific lore, the sum of 3000*l*.

After various appropriate speeches, thanks were voted to Sir John Tobin; to the Mayor of Liverpool; to the President, &c. of the Royal Institution; the Members of the Mechanics' Institution; the committee of the Savings' Bank; the members of the Liverpool Medical

Institution; the proprietors of the Botanic Gardens; the members of the Athenaeum, Lyceum, Lloyd's, the Exchange Rooms, &c., for the very valuable accommodation which had been afforded to the Association; to the various bodies who had placed steam-vessels at their disposal; to the Earl of Derby; Charles Blundell, Esq. of Ince; the proprietors of the Salt Mines; and others, who had kindly thrown open their works to the inspection of the Association; to the members of the Academy of Artists; to the local council; to Mr. Turner, the local secretary; to the Earl of Burlington, for the able and dignified manner in which he had presided over the meetings of the Association; and to those distinguished foreigners who had honoured the Association with their presence.

To all these well-deserved compliments, suitable thanks were returned; and one reverend gentleman (Mr. Campbell, we believe), the rector of one of the principal churches in Liverpool, in acknowledging that paid to the savings banks, delivered an address equally distinguished by eloquence, good feeling, and sound religious principles. It produced a vivid sensation on the auditory, and would be well worth preservation for the benefit of truth and science.

The Earl of Burlington said, the moment for the performance of his last duty had at length arrived, the laws of the Association wisely limiting their session to a single week. It was with a feeling of pain that he bade adieu to that assembly. The friendly intercourse of the week was now at an end, but the feelings which had been excited would not so soon pass away. He thanked the inhabitants of the town generally, for the manner in which they had been received. He wished, also, to express his sense of the kindness and hospitality which he had received from the chief magistrate of this town. This he did on behalf both of himself and Lady Burlington. He had nothing further to add, but that the meeting stood adjourned to Newcastle-upon-Tyne, where they should again assemble early in August next.

On Sunday, after divine service, a small party, consisting of the Earl of Burlington, Lord Compton, Lady Compton, Sir D. Wilkie, Sir W. Hamilton, Messrs. Sedgwick, Whewell, Greenough, S. Turner, De la Beche, Wheatstone, Jerdan, Turner, jun., availed themselves of the polite invitation of its proprietor, Mr. Blundell, to visit his extraordinary collection of marbles, &c., at Ince. Our readers may not be aware that these comprise a moiety of the famous Townley collection, Mr. Blundell's ancestor being a companion in the travel; and are wonderfully rich in Grecian art and Roman antiquities. Some of the groups and statues are of the highest character, and hundreds of mausolea, cinerary urns, inscriptions, busts, basso-reliefs, &c. &c. of the utmost interest: together with the pictures, also a grand collection, and including several of the noblest of Wilson's productions, they were examined with deep curiosity; and, after partaking of a handsome collation, and enjoying the converse of the venerable owner, a superb specimen of

"The good old English gentleman,  
One of the olden time,"

the party returned to Liverpool completely gratified with their pleasant excursion.

We are not aware that we have left unnoticed any of the proceedings at this interesting meeting, or slurred over any matter which could be useful to our readers. Masses of in-

applicable detail, formula of abstruse speculations, and discussions of trivial subjects, possessing more of personal than of public value, we have curtailed, but not of their fair proportions, — preferring, in these instances, quality to quantity. Experiments and questions of importance to particular classes, such as the miner, the steam navigator, the engine-maker, the railroad engineer, and the mechanic, have had their substance condensed, where we considered the differences of opinion and the volumes of words to be rather perplexing than elucidatory: nor have we dwelt upon vague and disputed theories which were left at the close in exactly the same position of uncertainty in which they were at the beginning; and in the investigation of which, in truth, no advance had been made during the last two or three years. We had no inclination to repeat our Bristol, Dublin, or Edinburgh statements.

The higher and abstract sciences have fully maintained their station in all these meetings; and the few to whom they are intelligible will, we trust, find all they can wish to know respecting their progress in our pages — viz. the results of extraordinary mental exercises.

Of the more practical illustrations of chemistry, botany, mechanics, we have omitted nothing; though in several cases, such as iron-smelting, the preservation of plants without air, and other points of minor inquiry, the conclusions of the Sections were themselves indefinite, and much postponed to future investigation.

The three Sections which occupied the most lively attention were the Geological, the Mechanical, and the Statistical. The first, from the eloquence and talent of its leading members, from its own novelty, and from the ease with which every body can become a bit of a geologist, must always be popular. At this anniversary, its chief contributions, though valuable, presented no new features of remarkable character. The peel of the orange was not penetrated far beyond the scratch of the pin. The Mechanical Section, as we observed in the course of our report, has grown in activity and strength. It will require a very watchful and intelligent committee to render its proceedings as beneficial as they are likely to be (in continuation) various and warm. It embraces so many objects of immediate and individual concern, that the conflict of opinion must be well regulated in order to make it nationally productive of good. The Statistical Section seems to be doing all that could be expected; collecting data for useful application hereafter, amongst which there must inevitably be a considerable accumulation of *caput mortuum*. The directors, however, deserve one great praise: they have steered clear of every questionable topic; and, though, as in geology, the facility of being a smatterer is a potent recruiter of members, the discussions have generally partaken of interest and utility.

Among things connected with the meeting, we should mention the greenhouse in which a variety of plants have been kept without the admission of air, or being watered oftener than once in four or five months. It is a glass cabin eight or ten feet long, and four or five in breadth: and the various shrubs appeared to be healthy and vigorous. But as there must be a rush of air every time the doors are opened, we cannot deem the experiments so absolute as those made on a smaller scale under bell or other glasses. The trials are curious, and since every one may readily make them,

we would recommend their adoption, especially to our fair botanical friends.

With regard to the "tottle of the whole" of this anniversary, it must be viewed with unmingled satisfaction. The town and inhabitants of Liverpool discharged the duties of hospitality in a manner to do themselves the utmost honour. The harmony and sociality of the entire proceedings were also especially gratifying. There were no collisions except such as if "a brother should a brother dare;" and the very slight mistake in inviting two presidents for the ensuing year was soon admirably adjusted by the tact and judgment of Mr. Murchison, to whose great exertions, as general secretary, throughout the whole of these transactions, as well as to his good-humour and pleasantry where philosophy doft some of her attributes for relaxation, the Meeting owed much of its success. The appropriation of a large and growing annual fund to promote the cause of science, is another very important feature of this Institution; the fruits of which must soon be visible. Never was a great, wealthy, and enterprising country so destitute of public or government support either as concerns science, literature, or art, as that country which is our boast. Let us hope, therefore, that this Association may gradually acquire sufficient power to occupy the vacant sphere of patronage and encouragement. Towards this desideratum we think some very simple measures of finance might essentially contribute. For example, to facilitate the payment of annual subscriptions, where the parties do not attend every meeting; we know many persons who miss years, and would yet pay their intermediate subscriptions if they were aware where they were receivable. Again, donations might be courted for any specific objects of science. Legacies might be invited for general purposes; in short, with good management, the fund might be much increased.

But we have no right to assume the post of dictator: it is pleasure enough to be an observer, and to feel that interest in the progress of the Association which every well-wisher to the prosperity and honour of Great Britain must feel in all its operations.

#### ELECTRICAL SOCIETY.

SATURDAY, 14th.—Mr. Gouling-Bird demonstrated a new arrangement of an electro-magnetic apparatus, dispensing with manual labour to break contact. This desideratum is effected by induced magnetism. Over one of the poles of the induced magnet, fixed vertically, a small ball of soft iron depends; on its being attracted, contact is broken, by which the magnetic influence is destroyed, the ball regains its position, contact is renewed, and magnetism again induced. Thus contact is broken, and renewed rapidly and regularly, and sufficient time allowed for inertia in the reverse currents to be overcome. To the laws of inertia Mr. Bird stated the imponderables were subject, and to this he attributed the cause of the second shock being weaker than the first, when the action of the ratchet-wheel and other adopted modes is too rapid. The effects produced by this new arrangement are more powerful than by any other electro-magnetic apparatus. Mr. Bird had, and did, elicit a spark from the secondary coil, which he believed had never previously been done. Mr. Bird concluded by saying, that he was not the inventor of a new apparatus, but hoped that the arrangements he had pointed out, and the results of his experiments, would become really useful in the hands of the instrument-makers and others.

#### FINE ARTS.

##### NEW PUBLICATIONS.

*The Sketcher's Manual; or, the Whole Art of Picture Making reduced to the simplest Principles; by which Amateurs may Instruct themselves without the aid of a Master.* By Frank Howard. 12mo. pp. 79. London, 1837. Darton and Clark.

THESE is something rather startling in the comprehensive title of this little work; and we confess that we do not think it is happily chosen. The whole art of picture-making in seventy-nine duodecimo pages! That would be *multum in parvo* indeed. By "picture-making," however, Mr. Howard means only the production of "pictorial effect." As he justly observes,—"The objects in a drawing may be accurately outlined, and shaded very correctly, very neatly and delicately finished, and yet it shall be less pleasing than a slight sketch, having no pretension to accuracy of outline or detail, but which possesses the charm of pictorial effect. The term picture is here used in a general sense, as meaning an agreeable object, or combination of objects, for contemplation; and pictorial effect is applied to that quality which distinguishes a picture from a diagram or map. In what does this magical power consist? Is it difficult of comprehension or attainment? The answers to these two questions will not be found in any work on the art, whether elementary or scientific. Yet there can be no doubt that the desideratum with amateurs and artists, and particularly with sketchers, is not only to represent forms, but to make pictures; to place the object or objects before the spectator under pleasing circumstances, or with what is termed "pictorial effect."

Mr. Howard proceeds to supply the deficiency with a clearness, and ability, and an evident knowledge of the subject, which must greatly increase the reputation he has already acquired by his works as an artist, especially by his "Spirit of Shakespeare," which, our readers will recollect, received high and frequent commendation from us during the course of its publication. Without the graphic illustrations, however, (which are numerous) it is quite impossible to shew the principles on which Mr. Howard proves that pictorial effect mainly depends. We must, therefore, refer to the book itself, of which every artist or amateur ought to put himself in immediate possession.

*Looking In.* Painted by H. P. Parker; engraved by W. O. Geller. Ackermann & Co. WHY will Mr. Parker thus multiply pictures painted from the same model? He seems to think that *decies repetita placebit*, but he may depend upon it that that is not the case. Mr. Parker is an artist of great talent; and we regret to see him doing himself so much injustice. We must also protest against his continued projection of the figure out of the frame. In the first instance, the novelty and surprise of the thing excused this irregularity: it now becomes offensive.

*Wyld's Map of the London and Birmingham Railway. The Distances computed by time.* INTERESTING even at present. On the completion of the railway, it will be an indispensable companion to the traveller.

*A Philosopher in search of the Wind.* Painted by Robert Farrier; drawn on stone by Thomas Fairland. Ackermann and Co.

Is the publication of this print at the present period intended to be a sly satire on some of

the recent proceedings at Liverpool? It is full of fun, and does great credit both to Mr. Farrier and to Mr. Fairland.

*His Excellency Sir Francis Bond Head, Bart. K.C.H., Lieutenant-Governor of Upper Canada, &c.* Painted by Nelson Cook, Esq.; engraved by C. Turner, A.R.A. Toronto, Upper Canada, Capreol; London, Colnaghi and Co.

A FIRMLY marked, manly countenance. The original picture was painted at the solicitation of the inhabitants of the city of Toronto.

*Studies from Nature.* By J. Inskipp. Plate X. Tilt.

THIS publication, for some time suspended, in consequence of Mr. Inskipp's absence on the Continent, has now been resumed. The present plate possesses the same vivacity of expression, squareness of drawing, and featheriness of execution, as its predecessors.

*A Genealogical Chart, with the Succession of the Kings [Sovereigns?] of England.* Darton and Son.

A small lithographic sheet, neatly mounted on canvass with roller; and shewing, in a very distinct manner, the course of the English monarchy, from the ancient Britons, to Victoria, "whom God preserve!"

*Importance of Punctuality.* C. Ingrej. ADMIRABLE as a moral lesson, if not very commendable as a work of art.

#### DRAMA.

*Covent Garden.*—After the *Provoked Husband*, on Thursday, a new melo-dramatic romance, entitled *Afrancesado*, was produced. It consists of a long series of incidents, for plot there is not, and is interspersed with some pretty music, by Alexander Lee, and a good deal of beautiful scenery. These gained some applause; but *Afrancesado* was not very successful.

*Haymarket.*—A petite comedy, entitled *The Romantic Widow*, introduced a Mr. Ranger to a London audience. He is a pleasant actor, and was more happy in his reception than the piece in which he made his *début*.

*St. James's.*—A burlesque upon Shakespeare's *King John* has succeeded in drawing down plenty of laughter at the St. James's, which has been well attended since the appearance of Mr. Braham, who is quite as popular, and who sings quite as well as ever. *Artaxerxes* is so well cast at this house, that it must fill it.

*Adelphi.*—*The Man with the Nose* has been added to the already attractive entertainments at the Adelphi. It is a clever farce, and nightly sends the audience home laughing.

*Olympic.*—*A Quiet Day* has been played every evening since our last; sufficient evidence of its success, and the clever acting of Keely and his wife.

#### VARIETIES.

*Odd Whim.*—A foreign journal states, that an Englishman, having lately obtained permission to live for a fortnight in one of the houses recently cleared at Pompeii, had it completely restored in its original style; and, with his family and servants, having assumed the ancient Roman costume, resided there during the whole period, like a citizen of the republic, making the perusal of the classics his sole amusement!

*Munich.*—An English artist, of acknowledged taste, who has lately visited Munich, is

delighted with the works of several of the German artists employed in decorating the new palace. Some of them, he declares, are quite as grand as the productions of Michael Angelo. How mortifying it is to compare the magnificent encouragement afforded to the fine arts by a petty state, with the petty encouragement afforded to them by magnificent England!

A recent New York paper gives the following as a "state of the markets:"—The operations in ashes are as *dry* as ever; coffee remains *unsettled*, as at last quotations; cotton continues *light*; drugs are not in request; fish sales for the last week have been remarkably *scanty*; flour has *rizz*, as it is well known several bakers *knead* (need) large quantities; in hides the demand continues strong, and some *tough* stories are told of some recent operations; indigo looks rather *blue*; iron goes off *hard*; lead continues *heavy*, but goes off rapidly in small quantities; sole leather is much *pressed down*; oil goes off *smoothly*; pickles are as *sharp* as ever; tar *sticks* to first hands; whalebone retains its *elasticity*; tobacco is much *puffed* by some, and *cut up* by others; the operations, however, are not to be *meessed* at.

**Archbishop Sharpe.**—The seal of the celebrated James Sharpe, Archbishop of St. Andrews, was recently turned up by the plough, in a field at Craigherb, near the mill of Boynadie. It is in excellent preservation, and has been deposited in the museum of the Banff Institution.

**Sea-Serpent.**—The Americans are not to have all the sea-serpents to themselves. According to the most authentic accounts, one has just appeared on the coast of Norway, some three-quarters of a mile long; but the same newspapers contain the speech of the president of the United States, which, by way of compensation, it must be owned, is equally *lengthy*.

**Mont Blanc** has been recently ascended by a party of English and Swedish tourists, but nothing of philosophical import added to former expeditions. We hope that balloon ascents may, in the course of the ensuing spring, be made available to experiments on temperature, and other atmospherical and meteorological phenomena, instead of being merely senseless shews.

**Different Construction.**—In the Statistical Section, on one of the days, the list mentioned a paper on "the Cellars of Liverpool;" which a person reading, innocently exclaimed, "I wonder if there can be any account of the wine in them?"

**Quotation.**—Lord Northampton made a very apt quotation on the reading of Captain Denham's paper "on the deposits in the Mersey." "It appears," said his lordship, "that the quality of Mersey is not strained."

**H. B.**—No. 503 of H. B.'s clever sketches is before us. We do not think it so happy as the generality of this gentleman's productions; but the likenesses of the Queen, Lord Melbourne, and Lord Palmerston, are very good.

**Organ Music.**—Some fine selections of sacred music have been played at the Music Hall, in Store Street, on a new organ, built for the Wesleyan chapel, at Leeds, by Messrs. Hill and Davison.

**Fulcher's Ladies' Memorandum-Book** for 1838, keeps up the character of its predecessors from Sudbury. It is in an elegant binding, and filled with useful and entertaining matter.

**Weather Wisdom.**—A week of beautiful autumnal weather has not verified the prediction of the past; we proceed with the week

to come.—"Variable until the 24th, when there are tokens of more calm and temperate air, with white (*cumuli*) clouds. The sun aspects Herschel, and the air grows cooler again towards the 28th—thermometer low, and the weather unsettled."

**Belgian Archives.**—The original correspondence of the Prince of Orange, William the Taciturn, with Margaret of Parma, Regent of the Netherlands, in the latter months of 1566, and the beginning of 1567, was lately discovered in the archives of the kingdom of Belgium.

**Acoustic Telegraph.**—It is said that an inhabitant of Austria has invented a tube, in the form of a speaking-trumpet, six feet five inches long, which conveys sound in 11 and 1-10th seconds to a distance of 12,000 feet.

**Francis M'Nab, Esq. of M'Nab.**—"The laird was a regular attendant on the Leith races, at which he usually appeared in a rather flashy-looking gig. On one of these occasions he had the misfortune to lose his horse, which suddenly dropped down dead. At the races in the following year, a wag, who had witnessed the catastrophe, rode up to him and said, 'M'Nab, is that the same horse you had last year?' 'No, py Cot!' replied the laird, 'but this is the same whip;' and he was about to apply it to the shoulders of the querist, when he saved himself by a speedy retreat."—*Kay's Edinburgh Portraits.*

#### LITERARY NOVELTIES.

Mr. George Doo is about to produce a highly finished engraving in line, from Newton's interesting picture of "Sternes and the Grissette;" and will in a few weeks be ready with his laborious work from Wilke's "John Knox Preaching," which latter has been in unceasing progress for nearly four years. It is the largest line print that has appeared since the days of Sharpe.

#### LIST OF NEW BOOKS.

Gems of Beauty, for 1838, displayed in a series of 12 Engravings of the Passions, by E. T. Parris; with Illustrations in verse, by the Countess of Blessington, Imperial 4to. 11s. 6d.—A Conspectus of the Pharmacopoeias of London, Edinburgh, and Dublin, &c., by T. Thomson, M.D. F.R.S. 3s. 6d.; Ditto, ditto, with tuck, 6s. 6d.—The new Botanist's Guide, by H. C. Watson, Vol. II. (Scotland and adjacent Isles) 12mo. 6s.—Crittwell's Housekeeper's Account-Book, &c. 1838, 4to. sewed, 2s.—Portfolio for the Publisher's Circular, royal 8vo. 1s. 6d.—Statutes, 4to. Vol. IV. Part II. (7th William IV. and 1st Victoria), 13s.—The Primitive Doctrine of Justification, by the Rev. G. S. Faber, 8vo. 3s.—Landscapes Annual, 1838, 8vo. 11s. 1s.; large paper, 2s. 12s.—Peter Parley's Universal History on the Basis of Geography, fcap, 7s. 6d.—The House I Live In; or, Illustrations of the Human Body, by T. C. Girtin, 18mo. 2s. 6d.—The Book of Private Prayers, by the Rev. J. A. Bolster, 32mo. 4th edition, 2s.—The English Annual, 1838, 8vo. 15s.—Pascal Bruno, a Sicilian Story, by Theodore Hook, post 8vo. 10s. 6d.—Finden's Tableaux, Imperial 4to., morocco, elegant, for 1838, 2l. 2s.; India Proofs, 3l. 3s.—Key to Knowledge, by the Author of "Always Happy," &c. 10th edition, 16mo. 3s. 6d.—Infant Knowledge, 5th edition, illustrated, 16mo. 3s.—Dr. Skeggall's Materia Medica, and Therapeutics, 12mo, 7s.—Dr. J. Wilson's Treatise on Simple and Medicated Vapour, Applied Locally, 8vo. 6s.—Fragments and Fancies, by Lady E. S. Worsley, post 8vo. 10s. 6d.—The Young Christian's Sunday Evening, by Mrs. Parry, 3d series on the Gospels, 12mo. 3s. 6d.—Third Annual Report of the Poor Law Commissioners, 8vo. 4s.—The Sketcher's Manual, by F. Howard, 12mo. 7s. 6d.—The Lady Annabella, by the Authoress of "Constance," &c., 3 vols. post 8vo. 11s. 6d.—A Residence in Greece and Turkey, with Notes on Bulgaria, &c., by F. Hervé, Esq., 2 vols. 8vo. 11s. 6d.—State and Prospects of the World and the Church, fcap, 6s.—Memoranda on difficult Subjects in Anatomy and Surgery, by R. Cruick, 2s.

CHARLES HENRY ADAMS.

Latitude... 51° 37' 38" N.

Longitude... 3 51, W. of Greenwich.

To the Editor of the Literary Gazette.

Deptford, 18th October, 1837.

SIR,—I venture to transmit you a concise description of the lunar eclipse of last week, as observed at Deptford, trusting that a communication from the residence of your late astronomical correspondent may not be unacceptable. The moon rose on Friday, 13th instant, at 5<sup>h</sup> 38<sup>m</sup>, accompanied with her usual splendour; and through the evening her disc was favourably exhibited for telescopic examination, rendered peculiarly interesting in expectation of the approaching phenomenon. About 9 o'clock, her light was partially obscured by a stratum of clouds, which, though not sufficiently dense entirely to obliterate her disc, yet, as it continued till within a few minutes of the emersion, disappointed the expected gratification of observing the entrance of the earth's shadow upon the lunar surface, and tracing its progress over her successive mountain ranges and deep caverns. It was evident, after 9<sup>h</sup> 31<sup>m</sup>, that the eclipse had commenced, as the moon's eastern edge did not penetrate the screen of clouds, when the other portions of the disc were faintly visible. The gradual approximation of the luminary to a crescentic form was observed through occasional openings in the cloudy medium; but it was impossible to ascertain either the moment of actual immersion, or whether it was visible to the point of greatest obscuration. On taking a supposed hopeless survey of the heavens about 50 minutes to 12 o'clock (which, till then, had remained hidden in intense darkness), symptoms of a clearer sky were observed in the eastern horizon; and the stratum of clouds had begun gradually to pass beneath the celestial canopy, apparently rising like a sable curtain in order to display, with greater effect, the splendid scene about to be exhibited. As the surface of the sky became gradually unveiled, the winter constellations shone forth, and enkindled many lively recollections: Orion was reclining near the horizon; above him were Aldebaran and the Pleiades, with Cassiopeia near the meridian, and Aries, Gemini, Perseus, &c., in their respective quarters. An anxious scrutiny was directed to the meridian, across which the cloudy curtain was rapidly passing, to observe whether the totally eclipsed luminary would be visible; when the moon suddenly appeared, glowing like a live coal or heated copper, the eastern edge being considerably brighter, as she was now approaching the moment of emersion. The stratum of clouds gradually passed onwards, and at length disappeared in the western horizon, leaving the star-gemmed pavement of heaven glittering with unusual brightness; while the lunar disc glowed as if about to be rekindled into unwonted lustre. About 2½ minutes past midnight, an intensely bright line on the eastern edge of the moon indicated the moment of emersion, and, in a few minutes, she presented the truly remarkable phenomenon of her crescentic phase near the meridian, with the stars shining brightly around her, instead of being bathed in the solar beams, as at morning or evening twilight. Sufficient light was now emitted from her disc to cast a distinct shadow from surrounding objects; and as the eastern limb emerged from obscuration, the western, though actually increasing in luminosity, was but dimly seen, owing to the strong contrast of brightness. The firmament was at this time eminently attractive; its choicest and most remarkable scenery was displayed; the most singular combinations of stellar phenomena were within the range of telescopic examination; while the gradual passage of the earth's shadow across the lunar surface exposed successively new regions to the solar influence. Imagination easily suggested the no less magnificent scenery from these respective tracts, as the sun glided from behind the earth's comparatively enormous breadth. About half-past twelve, a new stratum of clouds rose in the eastern quarter, and gradually concealed again those constellations that had been so beautifully unveiled; as it gradually approached the moon, still considerably obscured, it was delicately silvered by the feeble moonlight, leaving gulfs of intense blackness, through which the stars shone with considerable brilliancy. This portion of the heavens presented a similar appearance to the aurora seen occasionally during the past two or three winters; and, in fact, a few precursory clouds, from their fleecy aspect, were at first mistaken for a variety of this phenomenon. The halo formed by its approach to the moon partook of her crescentic form. The moon being again obscured, the only evidence of the state of the eclipse was the proportion of her disc that was able occasionally to penetrate the fleecy veil in which she was enveloped, until three minutes past one, when the eclipse was apparently concluded, though the instant of its termination could not be observed. About ten minutes past one, the moon suddenly shone for a few moments through a break in the clouds, and exhibited herself as perfectly free from the earth's shadow. With the exception of a few hours of the earth's shadow, half-past eleven and half-past twelve, this eclipse was not observed with the same gratification as that of April last; sufficient, however was seen to testify both to the precision of celestial movements, and to the exactitude of astronomical calculations.—I am, &c.

J. T. BARKER.

## ADVERTISEMENT,

Connected with Literature and the Arts.

TO ARTISTS, TOURISTS, AND ADMIRERS OF THE FINE ARTS.

**PARLOUR'S PORTABLE SKETCHING-CASE, OR DELINEATOR**, is confidently recommended to the notice of all persons attached to the Science of Drawing, as being infinitely superior to the Camera Lucida, and all other instruments hitherto invented, for the purpose of Sketching. The Sketching-Case may be held in the hand, and a correct Drawing made of any object or landscape; or it may be attached to a table, in the same manner as the Camera Lucida. It is simple in its management, and does not excite, in size, the common Sketching-Book. Manufactured for the Patentes, by Reeves and Sons, 150 Chancery Lane, may be had, also, of Smith and Warner, Marylebone Street, Piccadilly; of Watkins and Hill, Opticians, Charing Cross; and at all other Opticians' and Artists' Repositories. Ladies and Gentlemen who have the Camera Lucida may have the Delineator affixed to their own stem.

**WESTMINSTER MEDICAL SCHOOL.**

The Members of the above Society are hereby informed, that the Meetings for the Session will commence on Saturday, the 31st instant, at the Society's Rooms, Hunterian Museum, Great Windmill Street, Haymarket.

JOHN THURNAM, Secretary to the Society.  
October 16th, 1837.

**THE QUEEN.**—This national, first, and only authentic full-length Portrait of Her Most Gracious Majesty, arrayed in the Robes and Jewels of the Official Costume, worn on the occasion of her first Public Act, Dissolving the British Parliament. By express Command. Painted by A. E. Chalon, Esq. R.A., and engraving by S. Cousins, Esq. A.R.A. on the important scale of the Original Drawing. "It was painted at the express command of the Queen, who has presented it to her mother, the Duchess of Kent, as an offering of filial affection. It is a truly regal portrait, and is the first portrait of Queen Victoria painted since her accession to the throne."—*Times*.

"This is the portrait of our Queen, which, when diffused by the graver's art, will adorn every gentleman's house and every public institution in the kingdom."—*Morning Chronicle*.  
"As a memorial of her Majesty, and the first great incident of her reign, it will rank with works called national."—*Atlas*.  
"It presents a charming union of queenly dignity and feminine delicacy and beauty."—*Literary Gazette*.  
"Certainly it is the characteristic likeness of Queen Victoria."—*Spectator*.

"The composition is managed with consummate skill."—*John Bull*.  
"This is certainly (as it should be) Mr. Chalon's most successful work."—*Athenaeum*.  
"The Print will be ready early in next year, when, we have no doubt, it will be received as a most welcome present to the public."—*Morning Herald*.

The Price to Subscribers for this Royal Portrait:

Whose Names are inserted on the Publisher's List on or before the 1st of Jan. 1838	Before Letter'd	Letter'd	Proofs	Prints.
On Publication of Etching on 1st of Jan.	10	10	7	4
On Completion and Publication of the Engraving	12	12	8	5

Insert my name in the List of Subscribers to the forthcoming Portrait of Her Majesty, now engraving by S. Cousins, Esq. A.R.A. from the Original Picture for which Her Majesty sat to A. E. Chalon, Esq. R.A.  
To Mr. F. G. Moon,  
20 Threadneedle Street.

\* \* \* It will be necessary to insert the class of impression desired.

**BOOKS IN THE PRESS.**

Preparing for immediate publication, in 4 vols. post 8vo. (Printed uniformly with the *Life of Mrs. Hannah More*), with Portraits, &c.

**MEMOIRS OF THE LIFE OF WILLIAM WILBERFORCE.**

By his Son, ROBERT INAAC WILBERFORCE, M.A. Vicar of East Farleigh, late Fellow of Oriel College; and SAMUEL WILBERFORCE, M.A. Rector of Brighton. These Memoirs are drawn from a Journal in which, during a period of fifty years, Mr. Wilberforce was accustomed to record his private sentiments and his remarks on the incidents of the day—from his correspondence with his distinguished contemporaries, Mr. Pitt, Lord Grenville, Lord Melville, Mr. Windham, Mr. Canning, Lord Liverpool, Lord Muncaster, the Emperor Alexander, Prince Talleyrand, La Fayette, Jeremy Bentham, Dr. Currie, Dr. Burgh, Bishop Porteus, the Rev. William Mason, Dean Milner, the Rev. John Newton, the Rev. John Wesley, John Thornton, Esq., Henry Thornton, Esq., James Stephen, Esq., William Hay, Esq., Lady Waldegrave, Mrs. Hannah More, &c. &c.  
John Murray, Albemarle Street.

On November 1 will be published, in fcap 8vo. with Vignette Title, &c. price 6s. cloth.

**LIVES OF CERVANTES, LOPE DE VEGA, QUEVEDO, CAMOENS, GARCILASSO DE VEGA, &c. &c.**

Forming Vol. III. of *Lives of Literary Men of Italy, Spain, &c.* and Vol. I. of *Italy, Spain, &c.*  
Published October 1; History of England, Vol. VII.  
London: Longman and Co.; and John Taylor.

**THE LONDON AND WESTMINSTER**

REVIEW will be published on Monday, containing—  
1. Parties and the Ministry.  
2. Wills on Reed Organ Pipes, Speaking Machines, &c.  
3. Works of Miss Edgewick.  
4. Armand Carrel.  
5. Mrs. Trollope: Evangelical Clergy.  
6. Italian Literature since 1820.  
7. Works of Theodore Hook, Esq.  
8. History of Hanover.  
9. Congregational Dissectors.  
Henry Hooper, 12 Pall Mall East.

New and illustrated edition of Campbell's Poetical Works, uniform with Rogers's Poems, and "Italy."  
On the 1st of November will be published, in 1 vol. illustrated by Vignettes, from Designs by Turner, price 80s. boards.  
**THE POETICAL WORKS OF THOMAS CAMPBELL.**  
Edward Moxon, Dover Street.

**MR. BENTLEY** will publish in a few days, the following New Works:—

- I. Chelsea College, and its Traditions.  
By the Rev. G. R. Gleig,  
Author of "The Subaltern," "The Country Curate," &c.  
3 vols.
- II. The Squire.  
By the Author of "The Merchant's Daughter," "The Heiress," &c.  
3 vols.
- III. Italy.  
By J. Fenimore Cooper, Esq.,  
Author of "The Pilot," "The Spy," "England," &c.  
2 vols.
- IV. Walsingham, the Gambler.  
By Captain Chamier, R.N.  
Author of "Ben Brace," "A Life of a Sailor," &c.  
3 vols.

**THE NEW VOLUME OF "THE STANDARD NOVELS."**  
On the 31st instant, complete in 1 vol. new bound, and embellished with Two Engravings by Greatbatch, price 6s.  
**Mr. Ainsworth's "Rookwood."**

Forming the New Volume of  
**The Standard Novels and Romances.**  
Also, just published,

- VI. MRS. TROLLOPE'S NEW NOVEL.  
The Vicar of Wrexhill.  
With numerous illustrations by Hervieu. 3 vols.
- VII. THE LETTERS AND WORKS OF  
Lady Mary Wortley Montagu.  
Edited by Lord Wharncliffe.  
The 2d edition, revised, with Additions.  
In 3 vols. 8vo. with numerous fine Portraits.

VIII. The Old Commodore.  
Also, by the same Author,  
2d edition, 8vo.  
Rattlin the Reeler.

Edited by Captain Marrat, R.N. C.B.  
Author of "Peter Simple," "Jacob Faithful," &c.  
Richard Bentley, New Burlington Street,  
(Publisher in Ordinary to Her Majesty).

**BOOKS PUBLISHED THIS DAY.**

In super-royal 8vo. elegantly bound, 11. 1s.: India proof, 21. 2s.  
**HEATH'S PICTURESCAPE ANNUAL,**  
for 1838; by ERIC P. HEATH, Esq.  
(Which completes this portion.)

With 19 beautifully finished Engravings, from Pictures by  
T. Creevelock, Esq. and D. McClise, Esq. A.R.A.  
London: Longman, Orme, and Co.

In 1 vol. fcap 8vo. cloth lettered.  
**HINTS TO MOTHERS for the Management of Health during the Period of Pregnancy, and in the Lying-in Room: with an Exposure of Popular Errors in connexion with those subjects.**  
By THOMAS BULL, M.D.  
Physician-Accoucheur to the Finsbury Medical Institution, &c.  
London: Longman, Orme, and Co.

**MEDICAL GAZETTE.**

Nos. III. and IV. of the Volumes for 1837-8, just published, contain Lectures—by Sir Benjamin Brodie, on the Kidney; Dr. Williams, on the Chest; and Dr. Macleod, on Rheumatism. Papers—by Dr. Graves, of Dublin, on a New Treatment of Cholera; Dr. Lawrie, of Glasgow, on Dislocations of the Thumb; on the Nitrate of Silver, by W. Chapman and T. Cross, Esq.; on Fractures, by T. M. Greenhow, Esq. of Newcastle-upon-Tyne; on the Induction of Premature Labour, by E. A. Cory, Esq.; on the Working of the Apothecary Act, by Dr. Kerrison. Notices of several new Elementary Works. Reports from La Pitie, Guy's, Westminster, and St. George's Hospitals. Paper on the Voice, from the German of Müller. Extracts from Foreign Journals. Editorial Articles—on the Starving Experiments under the New Poor Law; on the State of Lunatic Asylums, &c.  
The current volumes will contain Lectures by Sir B. Brodie, Mr. Lawrence, and Dr. Clutterbuck; a Series of Papers, by Dr. Williams, on the Physical and General Diagnosis of Disease of the Chest; also a Course of Lectures on Clinical Medicine, by Dr. Graves, of Dublin.  
In Weekly Nos. price 8d.; and Monthly Parts.  
Longman and Co.

In 2 vols. post 8vo. price 30s. sewed,  
**GOETHE'S CORRESPONDENCE with a CHILD.**—The original of this work was published in German, in aid of Funds for the erection of a Monument to the memory of Goethe, and many thousand copies were sold. The present translation has been printed at Berlin, and sent to England to promote the same object.  
"All who study human nature, will find it interesting to read the heart of a guileless susceptible being, as it is unfolded with fearless and unreserved confidence in these letters, hallowed by the name of Goethe."—*Spectator*.  
London: Longman, Orme, and Co.

Vol. X. of  
**THE POCKET EDITION OF BYRON,**  
now complete in 10 Ten Vols. with Frontispieces, 3s. 6d. each, neatly bound and gilt.  
Vol. I. contains CHILDE HAROLD.  
Vols. II. and III. TALES.  
Vols. IV. and V. DRAMAS.  
Vols. VI. VII. and VIII. MISCELLANIES.  
Vols. IX. and X. MISCELLANIES.  
Any Volume may be had separately.  
John Murray, Albemarle Street.

**PARLEY'S GRAMMAR OF MODERN GEOGRAPHY.**  
In one pocket volume, embellished with eighty Engravings, price 4s. 6d. bound in cloth.

**A GRAMMAR OF MODERN GEOGRAPHY.**

By PETER PARLEY.  
Author of "Tales about the Sun, Moon, and Stars,"  
"Tales about Europe, of Asia, &c."  
A New Edition. Embellished with numerous Maps and other Engravings.  
London: Printed for Thomas Tegg and Son, 73 Cheapside; and sold by every other Bookseller in the United Kingdom.  
Of whom also may be had,  
All the other Works of Peter Parley.

**THE ORIENTAL ANNUAL for 1838.**

By the Rev. HOBART CAUNTER, B.D.  
With Twenty-two Engravings, from Drawings by the late William Daniell, Esq. and Charles Tilt, Fleet Street.

**ACKERMANN'S ANNUALS FOR 1838.**

**FLOWERS OF LOVELINESS,**  
Poetry by L. E. L., elegantly bound in an unique and perfectly novel style, and illustrated with Thirteen beautifully executed Engravings on Steel, by the first-rate Artists, after the Original Drawings made expressly for this Work. Imperial 4to, price 11. 11s. 6d.; Columbia, 4to. proofs, on India paper, 21. 12s. 6d.  
Forget-Me-Not, for 1838.

Appealing, by the magic of its name,  
To gentle feelings and affections, kept  
Within the heart, like gold.

A New Edition of Dr. Syntax in Search of the Picturesque; with numerous Wood Engravings, from Designs by Alfred Crowquill. Post 8vo. cloth, elegant. Price 12s.

**ENCYCLOPEDIA BRITANNICA,**

Part XC.  
This Part contains Inland Navigation, Navy, Nelson, Nepal, Netherlands, and many other interesting and important subjects.  
"In the modernised 'Encyclopædia Britannica' every old thing, we may say, has passed away and been renewed in a superior form, save the mere name. The first thinkers, writers, and authors of the age, have, in this work, consolidated a body of philosophy, history, belles lettres, biography, science, and art, which fulfils whatever is required from a complete circle of literature and the sciences. Hazlitt's masterly dissertation is one proof, and hundreds might be found."—*Times Magazine* for October.  
Adam and Charles Black, Edinburgh; Simpkin, Marshall, and Co., and Whittaker and Co. London.

**GEOLOGY AND RELIGION.**

Consistency of the Discoveries of Modern Geology with the Sacred History of the Creation and Deluge.  
By Professor SILLIMAN.  
Reprinted from the American edition, fcap. 3s. in cloth: will be ready in a few days.  
J. S. Hodson, American Agent, 115 Fleet Street.

**THE LIFE OF SIR EDWARD COKE,**

Lord Chief Justice in the Reign of James I.; with Memoirs of his Contemporaries.

By C. W. JOHNSON, Esq. Barrister-at-Law.  
"In undertaking the work before us, Mr. Johnson seems to have been influenced by that respect which the students of the law must ever feel for the memory of the great Lord Coke: in the prosecution of his task he has proceeded with diligence; and the result is a work, not merely valuable to members of his own profession, but interesting and amusing to the general reader."—*Athenaeum*.  
"This is a work that was much wanted. The author traces Coke from his cradle to his grave, and introduces us to him in his private capacity as a husband and a father, as well as in his character of Barrister, Member of Parliament, Lord Chief Justice, &c. Mr. Johnson's work is creditable equally to his talents and understanding; and will, there can be no question, eventually become a standard work."—*Observer*.  
Henry Colburn, Publisher, 19 Great Marlborough Street.

Now ready, handsomely bound in morocco cloth, lettered, price 8s. with a splendid Portrait of the Author,

## THE THIRD VOLUME OF WILSON'S TALES OF THE BORDERS, AND OF SCOTLAND.

This Work, which is published Weekly, has now reached the Third Volume, and enjoys a larger share of the patronage of the public in Scotland, England, and Ireland, than at any former period of its existence. Works formed on nearly the same plan, and with nearly the same end in view, have risen and fallen since its commencement, and proved, by their failure, the superiority of the original with which they competed. The aim of the undertaking was different from that of any periodical formerly known in this country; for, while other publications were busy in the fields of scientific, political, or exclusively didactic or entertaining literature, this aimed at the simple, but important, object of uniting, in the cheapest possible form, a part of that moral instruction which is the foundation and conservation of every well-ordered society, with the amusement which tends to lighten the cares of business and sweeten the duties of social life. To the heads of families, the work holds out many important advantages. It has been long a favourite maxim with those who have studied the science of education (and the names of Johnson, Kames, and Scott, may suffice as instances taken *primo obtutu*), that the most effectual mode of training the heart—the seat of morals—is, by stimulating, through the medium of portrayments of real life, the sentiments of virtue; and there is very much reason to fear that the prevailing passion for imparting knowledge and furnishing entertainment, abstracted from any view to the inculcation of morals or the improvement of the heart, may tend only to the acquisition of one great good at the expense of a greater. To all the reading public, whose time or means, or both, are limited, the advantages of a cheap work of this kind, entirely original, must be apparent; the desultory reader may find in its pages the varied entertainment of an hour; the professed novel reader may discover that, in the "Border Tales," a rational love of amusement may be gratified at the rate of not more than 2s. 6d. for the ordinary novel standard of 3 vols. of fiction; while the common objection to this latter species of literature, and one proposed especially by those whose interest it is to guard the morals of the young—the inculcation of a false sentimentality, destructive as well of the strength of mind which is necessary for the practice of virtue, as of the proper moral perceptions themselves—will be found to have been studiously provided against. To society at large, a work whose cheapness facilitates its entry into the humblest dwelling, and whose aim is to improve while it entertains, must always be of importance in proportion to the success of its execution. The tales are varied in every form—humorous, pathetic, traditional, historical, and descriptive—suitable to every taste and mood of mind, and not less guarded from the possibility of giving offence to the nicest delicacy of sentiment, than preserved from interfering with the sanctioned creeds, prejudices, and feelings of party, whether political or religious. The work, as is indeed now well known over the kingdom, has met with high commendation from the critical press. *The Athenaeum*, the *Literary Gazette*, the *Metropolitan*, and other leading critical journals of England, have stamped it with very high approbation; and almost every newspaper in the kingdom, whose practice it is to review weekly periodicals, has awarded to it uniformly the highest praise. Its widely extended circulation, however, forms the best test of its intrinsic merits, as well as the most legitimate justification of this recommendation of it to the continued patronage of the public.

The "Border Tales" may be had in Weekly Numbers, Price Three Half-pence, and in Monthly Parts, in a neat Wrapper, price Sixpence.

The First and Second Volumes may also be had, in cloth, price 8s. each.

Published for behoof of the Widow of John Mackay Wilson, by

### REVIEW OF NEW BOOKS.

*A Residence in Greece and Turkey; with Notes of the Journey through Bulgaria, Servia, Hungary, and the Balkan.* By Francis Hervé, Esq. Illustrated by tinted lithographic Engravings, from Drawings by the Author. 2 vols. 8vo. London, 1837. Whittaker and Co.

It appears, from a passage in his second volume, that the author was unfortunate enough to lose the collected *matériel* for this publication, and thus be compelled to write chiefly from memory; a circumstance which may account for and excuse many imperfections. "At dusk," he says, "we came to a halt at a small village, the name of which I forget, but think it was Pirodas. Of many others, also, I am in doubt, a deficiency that it is not in my power to rectify, having, unfortunately, had a portmanteau stolen in London, with all my memoranda, four years of journals, and nearly three hundred sketches, taken in different parts of the east; therefore the reader must pardon any inaccuracy which may appear in the names of persons and places, and attribute it to the right cause, which is, that I write from memory alone."

It may thus have happened that many things, generally thought essential to foreign travels, are but very lightly touched upon by Mr. Hervé; whilst accounts of courts, balls, soirées, and such-like gossip as one often finds in the columns of fashionable journals, fill up the pages to an extent which cannot be much relished by the rational reader. We ought not to censure the author, however, very severely for this course; since he honestly and candidly sets out by warning us that it is what we have to expect from him. After a dedication to Lord Longford, somewhat in the exploded style of compliment, he opens Chapter I. with the rather startling heading of "The Author's Bad Habits;" from which we learn, that he is an artist, and determinedly addicted to a "total want of arrangement and order;" that all with him is "loose and desultory;" and that with "something less than nothing a-year," he performed these peregrinations, and painted portraits for a pass- and we presume support, as Goldsmith played the flute.

In this trim, and with these habits and pursuits, readers must be content to take him as he is; and, to shew what he has made of it, we shall proceed to cull a few samples from his observations and descriptions.

Having passed in a wretched Austrian merchantman from Marseilles to Napoli, we shall commence with his written portrait of King Otho,\* of whom a lithographed likeness is also given.

"When one beholds a sovereign, we generally look at him with a very scrutinising eye, endeavouring to discern a something beyond the ordinary stamp of man. To make any discovery of that description in Otho, must require a being of superior penetration; at any rate, I must confess my own deficiency in that respect,

\* There are also some striking sketches of scenery, and portraits of celebrated Greeks, such as Mavrocordato, Canaris, &c. &c. who sat to the English artist professionally.

never having been able to perceive that majesty of appearance in the young king which we naturally imagine the attribute of monarchs. His countenance is ever replete with the expression of good-nature, and is in that instance a faithful index of his character. He is in stature about the middle height, perhaps rather above, may be from five feet nine to ten inches; would appear taller if he did not wear his hair so flat to his head, as though it were gummed thereon; and, as if to preserve it constantly in an unruffled state, he has a habit ever and anon of stroking it down with his hand, thereby retaining it in the most perfect and obedient state of smoothness that man could desire. I never saw one rebel hair astray; happy would he be could he keep his subjects in the same state of subordination. But I suspect that this extreme neatness of coiffeur assists in giving him the air of a grocer's apprentice, when dressed in his Sunday clothes; that is to say, those of Bishopsgate Street or Holborn, as those of the west end are more stylish-looking fellows than King Otho: and, indeed, he has other symptoms which savour of the grocer's shop, having a curious knack of continually giving innumerable little nods of his head, which one might be led to imagine he had acquired from endeavouring to emulate those Chinese figures, the usual appendages of dealers in groceries. The comparison may be carried still further; nothing can be more inoffensive than the physiognomy of those images; but, undoubtedly, that of the king's is as much so. In fact, he always appeared to me to have the expression of a good lad whose master had just patted him on the head, and said to him, 'There's a good boy;' thus giving the youth an air of satisfaction with himself and all the world. It would not be fair for me to comment on his colloquial powers, not understanding the German language: what converse we ever had together was in French, which he spoke very indifferently; and having a great many nervous little twists and quirks, in addition to the aforesaid incessant nods of the head, his articulation appeared to me to be impeded, though his animation certainly was increased by these vivacious gesticulations. The fact was, that I could seldom understand what he said, and it was quite evident that I was as rarely comprehended by him: 'tis true he is deaf with one ear, and I, with my usual bad tact, always contrived to get on the deaf side; it may, therefore, be easily imagined that our conversation was not very brilliant, having no other merit than its brevity. He has been very wickedly styled by some of the English newspapers, the ugly King of Greece; but this is going too far, as I never can admit that, where so much good-nature is associated with a countenance, as is so conspicuously the case in his, the term ugly is admissible. I know no better manner of describing him, than by quoting the words of one of the ambassadors of his own court, who observed, that when his features were quiet he was very passable, but the moment he spoke or laughed his whole face tumbled to pieces. On these occasions, had not Providence, in all its gracious mercy, placed his ears remarkably far back, they must have long since fallen a sacri-

fice to the threatened invasions of his mouth. But his eyes and complexion are good; and when in uniform he is much better looking, having a more patrician appearance, particularly on horseback, as he sits his horse gracefully, and rides well."

His majesty's Bavarian followers are described as very awkward and ugly fellows; and in the female sex of Greece itself our author finds nothing but commonplace countenances and clumsy figures. The national character is also drawn as worse than bad.

From Napoli, a trip to Epidaurus, Egina, and Athens, is not productive of much novelty; but there is a slap at the correspondents of the London Journals, which we should like to see answered or explained.

"I met in the east," Mr. Hervé tells us, "with several correspondents of the London papers, gentlemen receiving high salaries, and generally passably well-informed men; but I was much surprised at the light manner in which they gathered their intelligence, the little trouble they were at to ascertain whether it was correct or otherwise. In one instance, where I convinced one of them who read me the article he was about to send to England, that part of what he asserted was the direct opposite to the fact, he replied, 'Oh, never mind, it will suit my purpose just as well; so it shall go as it is, and will be more amusing than if I were to send them the real truth.' One of these gentry went to Egypt, and received an introduction to a certain consul at Alexandria, a complete creature of Mehemet Ali; and, as the literary gentleman met with much hospitality from the said consul, whilst he ate his dinners and drank his wine, he listened to his tales, representing the pacha all that was immaculate, and his dominions, with regard to population, finance, army, navy, agriculture, and other resources, most prosperous and flourishing. The hired scribe then framed his article for his London employer accordingly; in short, as much the opposite of the real fact as Mehemet Ali himself could desire, as a description of himself and his government, to figure away in the English papers; and a most brilliant gem of statistical information was drawn up, in very pretty language, and most highly edifying for those who might never have an opportunity of knowing better. However behind us in civilisation they may be in the east, with respect to the manoeuvres and trickery incidental to the manufacture of newspapers they already rival us. Whilst I was at Napoli, the editor of a journal published in Turkey arrived, and was overwhelmed with attentions from all the authorities, and persons concerned in the government. It was well known that he had entered into some arrangements, for which he was to receive a certain consideration; and, in turn, it was understood, that he was to extol the Bavarian government in Greece to the utmost of his powers of elocution: this compact was entered into with the anti-d'Armansperg faction. Afterwards, I met with this same editor in Turkey, and I remarked how much Greece was indebted to his paper, for his flattering commendations regarding the improved state of its affairs, and the

political conduct of its rulers. I thought his reply was rather ambiguous; and some weeks afterwards, he complained to me that D'Armanberg owed him a certain sum of money, for which he had written, and had only received an evasive answer. About a month after this, he stated the amount owing as double what he had before said; and a third time he mentioned a still higher sum, and that he could obtain no answer whatever from D'Armanberg to his letters: adding, that he would give him one fortnight longer, and if he did not reply in a satisfactory manner by that time, he would write as much against the Bavarian government as he before had praised it; declaring, that he was sure it was in his power to ruin Otto and his whole gang, and get them driven back to where they came from; and he certainly did hurl his anathemas at them at a most tremendous rate. D'Armanberg deigned not to notice his thundering declamations, which had little influence on Greek affairs; the editor remained unpaid, and unrevenged. I suspect his contract had never been ratified by the president, but merely made with his enemies, who had pledged themselves to take so many papers weekly, to a certain amount, on condition that their measures were upheld therein. This explains the increase of the sum with the increase of time adverted to by the editor, in complaining of D'Armanberg's conduct, who certainly could not be blamed for not adhering to an engagement made with his opponents."

Pass we from this subject to some Greek traits.

"It is a curious circumstance that the Greeks, in any trifling quarrel, instead of attempting to strike each other, immediately stoop and pick up a stone to fling at their opponent; and, from constant practice from childhood, their aim is so unerring, that I never saw them miss their mark."

"Many foreigners imagine that the Greeks are deficient in personal courage, because they will take a blow from those whom they consider as Europeans without resenting it; but they have an idea of the superiority of those who come from civilised countries, and regard them almost in the same light as the horse dogs his rider, and never would dream of exerting their physical strength against beings they regard as of a more elevated species than themselves. From any one that they conceive an equal, they would not endure for an instant what they considered an insult. Although the Greeks are so totally destitute of any idea of the art of painting, they are very fond of displaying their graphic powers on their houses, by adorning them with borders formed by designs of landscapes, of houses, trees, and figures, which rival each other in stiffness. I was much amused by the manner in which the Greeks handle a picture. When you present them a miniature, or portrait of any one, instead of holding it as we should with the head upwards, they always turn it with the side of the picture so placed as to form the base, and sometimes they will twist it upside down altogether, but never by any chance do they hold it in that direction that a rational being would. The ex-monarch (late governor) of Napoli had his son's likeness taken in profile; and the grandmother of the child, when shewn the picture, was very indignant at there being but one eye. I endeavoured to make her understand, through the medium of an interpreter, that the other eye was on the other side, meaning of course the other side of the head; but the old lady mistaking what was meant, turned the paper round, expecting to

find the other eye on the other side of the paper. But in this idea she was not alone, as I once saw a miniature painted in Russia, which in front represented a reasonable looking being. I was told to turn it round, when I found the back of the head and shoulders painted so as to correspond with the front; and I found that the original had given regular sittings for both sides of the picture, so that they had a sort of double likeness, and I was assured that the one side was as striking as the other; and nothing could convince the parties to whom this curiosity belonged, but that if I would introduce that style of portrait (that is, back and front on the same picture,) in civilised Europe, I should make my fortune. One art there is in which the Greeks excel, and that is embroidery, in which they display the greatest taste, and by its aid so considerably add to the beauty of their costumes."

"The Greeks of the present day are perhaps as mixed a race as any in Europe; and the major part of them would be very much puzzled to trace their ancestry to very remote antiquity. Certainly there are the Canteuzenos and the Pallalogos, who undoubtedly are amongst the most ancient families in Europe. Greece has had many masters; and each appear to have left some specimens of their breed. Migrations from Asia have also often added to the population of Greece; hence must have arisen that Jewish style of countenance so frequent amongst many of the handsomest Greeks. In fact, their features have a more eastern cast than might be expected of Europeans; and every vestige we have in sculpture of the ancient Greeks, presents quite a different style of physiognomy from the present race. The outline of the face was much straighter, and the features smaller; and even in the representation of their most sturdy heroes, no resemblance can be traced of the enormous noses, so prevalent in modern Greece, and which I suspect are of south-eastern origin. In passing through the country, I have sometimes seen that beautiful line of feature so constantly found in the antique; but I doubt not but that I should have found as many in other countries, had I sought them as much as I did in Greece. The men from Hydra I remarked as being particularly good looking; a fair middle height, remarkably strong made, very fresh coloured, and fine open countenances; as opposite as possible to the green-yellow-looking Moreotes, who have mostly a sinister expression. The Hydryotes almost all look alike. I am not alone in that remark. I remember a stranger, observing a group of these islanders together, declared that such was the resemblance they bore to each other, that it might be imagined they were all brothers."

"The Greeks certainly are fond of adorning themselves, and occupy their thoughts more about costume, than might be imagined. Colotroni sent his fesse (the red cap) to Paris, to have it arranged as a Roman helmet, which he had surmounted by a great tail of horse-hair dyed blue: for epaulets, he had lions' heads in brass, with chains of the same metal hanging from them. When thus accoutred, he might have been presented as a complete model of a captain of handitti. Salvator Rosa could nowhere have found a more fit subject for his pencil. I had his costume some time at my apartments, whilst I was taking his picture; and what with its singularity, and the extraordinary workmanship of his arms, they altogether formed so curious an appearance, that they might have been a welcome present to any museum. Some of the Greeks wear immense mustachios; one man I once saw tie them behind his head!"

In their language "Most of the words which

imply luxuries of any sort are from the Italian; many others are Latin; and, in fact, every nation under whose yoke the Greeks have fallen appear to have bequeathed them some words of their language; but that which is most singular, is, that many words of the first necessity, such as house, which in modern Greek is 'spoeite,' should be totally different from the ancient. At this time there are many well-informed men in Greece who are endeavouring to correct the present language, and assimilate it as much as possible with the ancient Greek. In some parts, they have a curious manner of transforming our Christian names; as Katherine, they call Caktinka; John, Yani; and Mary, Maryonka. Demetrius is one of their most favourite names. There are now some literary men who are rising in Greece, and whose works are published in the Greek language, which is purified as much as possible, retaining sufficient of its present corruption only as is necessary to render it comprehensible to the natives. This is the case also with all the public ordinances, police regulations, &c. Amongst their favourite authors, is one named Souzzo, whose poetry has been much admired; he has also published a novel, and was preparing another at the time I quitted Greece, which was to be partly historical."

From Greece, respecting which these are the best selections we can offer, Mr. Hervé went to Smyrna, where he staid some months, and tells us a number of stories about the inhabitants. From Smyrna, his next step was to Constantinople; and as we have given his portrait of one sovereign, we shall give one of a greater monarch, though far deteriorated below the line of preceding travellers: but this and a brief conclusion must be reserved for No. 1065.

*Fragments and Fancies.* By the Lady E. Stuart Wortley. 8vo. pp. 142. London, 1857. Saunders and Otley.

We believe that there are many to whom the sweet world of poetry is a fountain sealed; they know nothing of the soft and glittering waters whose dew has never fallen, whose light has never played around their dry and dusty path. We pity them, for to how many delicious sensations are they strangers! This is not the case with the graceful writer whose pages are filled with that susceptibility to natural loveliness—that keen, but elevated feeling, which is at once the instinct and the inspiration of poetry. Truly may the poet say to the beautiful world around him,

"'Twas but as the wind passing carelessly over,  
And all the wild music it waked was thy own."

He does but find voice to the deep harmonies of nature. Lady Emmeline is obviously keenly alive to all the influences of nature: the landscape golden with sunshine; the flower breathing of the sweet and subtle life within; and the wind that brings unknown melodies—all of these call upon the spirit within her; and the result is such songs as the following:—

"What shall be Missed?"

The dove—the fond, fond turtle-dove—  
What truth dwells in her breast!  
Oh! what a shrine of perfect love  
Must be her hallowed nest.

Lovingly piles she her sweet care  
Midst the deep greenwood shades;  
And Love's own brightest star shines there,  
The star that never fades!

The lark—the glad rejoicing lark—  
He makes the sky his own,  
And soars from earth the dim and dark,  
And mounts as to a throne!

Heaven, earth, and air, resounding ring  
With his triumphant strain;  
Then who can think of such a thing  
As sorrow—or as pain?

The rose shines forth in splendour bright—  
Fairest of flowers that blow—  
It is a rich and rare delight  
To gaze on that red glow!

The queen of gardens and of bowers,  
She reigns with tenderest sway;  
And all the radiant tribe of flowers  
To her must homage pay.

The dew-drop sparkles on the leaf  
Ere yet its life is o'er;  
For fragile is that life, and brief—  
A moment—and no more!

But oh! thou gentle turtle-dove,  
Ere long must thou depart;  
And who shall miss the perfect love  
That heaves thy little heart?

And, lark! rejoicing, rapturous bird,  
When death shall be thy share—  
When thy deep song no more is heard,  
Shalt thou be missed in air?

Rose! loveliest, sweetest of all flowers,  
When thou hast drooped and died,  
Shalt thou be mourned for in the bowers,  
With all thy bloom and pride?

Bright dew-drop!—when the next fair spring  
Calls forth each flower that blows,  
Shalt thou be needed, then, to fling  
Sweet coolness o'er their brows?

Nothing is missed—and nothing mourned—  
Soon is filled up the place  
Of all that once the earth adorned—  
While race succeeds to race.

Whole tribes of turtle-doves shall pour  
Their souls on low away—  
Feeling as thou hast felt before—  
Thou feel'st, sweet bird—to-day!

Thousands of larks shall mount as high,  
And sing a strain as clear,  
And weave as rich a harmony  
As thine, which now I hear.

Thousands of joyous larks shall spring  
To where morn's sunbeams shine;  
Upon as strong and free a wing  
With hearts as light as thine.

Scores of bright roses shall unfold,  
And blush with crimson glow,  
When thou dost thy rich ample withhold,  
Sweet rose, so radiant now!

Myriads of dew-drops yet shall shine,  
Like studs of sunny light,  
With sparkling brilliancy like thine,  
Fair dew-drop—now so bright!

Love—beauty—music—purity—  
These things shall ever last;  
These things shall never, never die,  
For them there is no past!

And, oh! 'twould be a wretched thing  
If these indeed could pass,  
Like earth's frail children withering—  
But they are of loftier class!

They still shall last, and they shall live,  
Though all around them die;  
Their mortal tenements survive  
And light the eternity!

The lark may die who sweetly sung,  
For him shall day grow dim;  
But though that living lyre's unstrung,  
Music dies not with him!

This rose shall fade, which hues of light  
On all seems to confer;  
But though she bear decay's dull blight,  
Beauty dies not with her!

The dew-drop may be quickly dried  
Beneath noon's flaming sky;  
But though no more with that allied,  
Purity shall not die!

Death will smite sore the turtle-dove,  
And still her throbbing heart;  
But the everlasting soul of love  
Shall ne'er from earth depart!"

"The Grave of the Gifted.

A grave for the gifted!—where, where shall it be?  
By the echoing shores of the hollow-voiced sea?  
Oh, no! let those ashes at last sink in rest—  
Now the strong passion-whirlwinds have died in her breast!

For the gifted and beautiful lost one—a grave,  
But not in the precincts of ocean's hoar wave;  
Too much of life's tempests and tumults she knew,  
Let her sleep 'neath the skies' gracious weepings of dew!

Like a bird from the storm—all awaried, o'erworn—  
To a nest of repose be the lovely one borne,  
Where no loud savage storm shakes the moon-lighted air,  
But the breeze a sweet message from heaven's shore shall bear!

A grave for the gifted!—where, where shall it be?  
Where the bright summer-treasures yield wealth to the bee—

Where the faint-thrilling voice of some fountain is heard,  
And the rich air is rent by night's passionate bird.

Where old chestnut-trees shed round a twilight of gloom,  
Which doth hallow and mellow the wild flower's meek bloom;

Where the fragrant spring-rains dance in joy to earth's breast—

Sweet earth!—with a blossomy richness oppressed.

Where the whitest of roses undauntingly blow  
More pure and more soft than the enwreathed mountain snow;

Where the starlight still tremblingly signal the hours,  
And throw sudden gleams o'er the wood-bosomed bowers.

Where the sunflower shall burn, and the lily shall bend,  
And the acacia its leaves with the willow shall blend!  
Oh! the old kingly laurel's illustrious gloom  
Overshadowed her life—be that far from her tomb!

A grave for the gifted!—a grave for the young!  
Since sealed the pure lips that so thrillingly sung;  
But far from the laurel, the tempest, the billow,  
Where stillness is deepest, there spread ye her pillow!"

"No More!

No more!—Oh! it must be no more!—

That precious dreaming o'er that precious love!

Must, then, such mighty happiness be o'er—

And must my heart wail like a wounded dove

No more?—Oh! it must be no more!

Ne'er shall I know its kindling might again!—

That heart-quake of young passion in its power;

But faintly drop as flowers beneath the rain,  
And die in dreams of that last meeting-hour

No more!—Oh! it must be no more!

And spring is here, bewilderingly bright—

A laughing world of sunshine and of rose

Greets every where the heart, and thought, and sight;

But all in vain—naught brings me now repose,  
No more!—Oh! it must be no more!

Oh! the unburied dreams that haunt my mind,

Spring, with thy scent-charged flowers, do thou en-  
chain,

Nor let me mourn, heart-wasted, unresigned,

What mourning never can bring back again.

No more!—Oh! it must be no more!

Past—perished—now—for evermore—and past—

That costly consciousness of answered love!

Let my heart tremble into rest at last,  
And wear the chains it unsuspecting wove!

No more!—Oh! hope must be no more!"

There are some fine passages in "Church-yard Contemplations," but they should be read together; and we close the volume with gratitude to the fair writer, and a sure hope that we shall soon have to welcome "the gifted one" again.

*The Authors of England. A Series of Medallion Portraits of Modern Literary Characters, engraved from the Works of British Artists.* By Achille Collas. With illustrative Notices by H. F. Chorley. 4to. pp. 105. London, Tilt.

MRS. HEMANS, Scott, Byron, Southey, Lady Blessington, Coleridge, E. L. Bulwer, Lady Morgan, Shelley, Moore, Lamb, Miss Mitford, Campbell, and Wordsworth, are the components of this volume, in steel and letter-press. Of the latter, little need be said, but that it is as complimentary and flattering as biography or tombstone could desire: indeed, as long memoirs abound of nearly every one of the individuals here collected and bound together—it would be a treat to see them all at the same table, or in the same room.—Mr. Chorley had it not in his power to do much with his task.

It was only necessary to exercise prudence, to suppress rather than enlarge, and to be ignorant rather than inquisitive after intelligence; and so to get through with contentment to himself, his employers, and his subjects. He deserves praise:—and we shall only quote one passage, which has amused us. It occurs in the notice of Scott; where, having particularised certain characters in his works, his biographer tells us, with genuine Irish naïveté—"Our examples have been purposely selected at random, and from the later as well as the earlier novels, to shew," &c. &c. On the author's comparing the writings both of Lady Morgan and of Bulwer to Marmontel, and of his thinking Miss Mitford the *Claude*!! of village painters, remark would be wasted; but the lovers of

similes of dissimilitude must appreciate them highly.

We have now a few words to offer on the medallion portraits. Medallions they may be called; but to the name of portraits, if by that is meant "taken from the life," they have no pretension whatever. Mrs. Hemans and Mr. Bulwer are just passable. Scott's is a heavy, unmeaning profile. Byron resembles no Byron ever seen before, and the mouth, his most expressive feature, is defective. Southey is gratuitously endowed with a great Roman nose, and Lady Blessington is allowed hardly a nose at all, but favoured with a twist in the shoulder; we must confess as fair an aim as could be found for machine distortion. Coleridge and Moore have not a feature of the originals by which they could be sworn to by their most intimate friends; and Charles Lamb is so like John Kemble, that the print may be sold for either; but, in the way of honesty, should only be sold for the last. If it were not for a huge ear, Lady Morgan's head would do for one of the "Gems of Beauty:" perhaps Parris may get her ladyship to sit to him as a model for next year. Shelley has a droll fat-cheeked face, and a marble wig; while Miss Mitford has ditto, with a marble cap to match. Poor Campbell would not know himself; and Wordsworth is a superb caricature, with a shadow between his brow and his nose, meant, we suppose, to intimate a lake, and thus the poetical school to which he belongs.

At the tail of these abortions is a sheet of engravings, of which one, of the Ariadne, is inscribed, "Answer to Mr. Bates's Challenge, *Literary Gazette*, No. 1047, February 11, 1837;" and it is just such an answer as might have been expected, even after taking eight months to consider. Half a dozen countenances, rather more distorted than those intended to be real likenesses of the individuals in the body of the work, give about such an answer to that challenge, as if an impertinent fellow, being challenged, instead of meeting, *made faces* at his challenger. But, lest this mode of rebuff should be deemed insufficient, there is a long "memorial of facts" (?) about the process of M. Collas, superadded; to which, if need be, we may hereafter turn; but, in the meantime, think it quite sufficient to refer to the *Literary Gazette*, No. 1047, and the splendid example of engravings by Bates's machine which is given with that Number.

*Gems of Beauty displayed in a Series of Twelve highly finished Engravings of the Passions.* From Designs by E. T. Parris, Esq. With fanciful Illustrations, in Verse, by the Countess of Blessington. London, 1837. Longman and Co.; New York, Appleton and Co.

In this beautiful volume, the fertile pencil of Parris has embodied twelve subjects,\* certainly not new to the Arts, but treated in a manner at once so characteristic, and yet so original, as to reflect honour even upon his abundant invention and genius. Every figure and group is feminine (with the exception of a dead warrior in "Despair," and a cavalier in the distance in "Envy"); and, conjoined with these, "Affection" made maternal; "Anger," "Pity," "Jealousy," "Hope," "Cheerfulness," "Remorse," "Joy," "Fear," and "Love," are severally represented in the most expressive and delightful style. Where all is

\* We have employed the word subjects because we are not clear that "Cheerfulness," for example, can be called a passion; or, could we say the passion of Affection?—Ed. L. G.

so charming, it is hardly worth while to point at separate instances of gracefulness and taste; but we may notice the dog in the group of Affection, as finely enhancing the story it tells—the waned moon at the casement in that of Jealousy—and the specks of vessels beyond the lighthouse in that of Hope—as simple instances of the skill with which talent induces the slightest accessories to add to the effect of its principal aim. Of the various plates we can scarcely tell which we most admire; for it is not easy to choose among so many lovely countenances and attractive forms. First, the pretty pouting girl, in Anger, excites the wish to dissipate her resentment; then the dreaming happiness in Jealousy, is most seductive; even the misery of Despair cannot repel the desire to alleviate distress in so sweet a bosom; and Envy looks so like disdain also, that we are not sure we should dislike an attempt to change the feeling in one apparently so framed for softer emotions.

To illustrate these *Gems*, Lady Blessington has exercised her poetic powers in brief, but appropriate and descriptive verse. Need we say, coming from her pen, that elegance, tenderness, and mind, are obvious throughout? From the pieces we select Hope as an example; merely remarking that, as, in one of the figures in Cheerfulness, we recognise a hint of attitude well taken from Sir Joshua's Comic Muse, so, in this of Hope, a grateful remembrance is recalled of one of Lawrence's most admirable productions.

"Hope,

Whither, Siren, roamest thou,  
With bright eye, and open brow,  
Lending infancy along  
With thy sweet, entrancing song?  
Fair deceiver! dost thou go  
To the mourner, murmuring low,  
By his bed of care and pain,  
'Sleep! the spring shall come again?'  
Send'st thou o'er the angry sea,  
Dreams of hamlet, field, and tree,  
Say'st thou, 'Droop not, home is near!'  
To the storm-worn voyager?  
Tell'st thou Love of sunny hours  
By calm lakes, in garden bowers,  
(Far away Contempt and Pride),  
With the peerless at his side?  
Or, in clarion-music loud,  
Dost thou call to warrior proud,  
'Lo! thy fame?'—or miser cold  
Startle with the chink of gold?  
Or for him, who all his nights  
Keeps a vigil shared by sprites—  
The pale poet—through the gloom  
Build'st thou up a laureled tomb?  
Dreams—all dreams—yet who could say,  
Flatterer, thy false music stay?  
Who could break thy wand? not I—  
Cheat me, dear one, till I die!"

*The Assembled Commons; or, Parliamentary Biographer: with an Abstract of the Law of Election, and the Usages of Parliament.* By a Member of the Middle Temple. 18mo. pp. 311. London, 1837. Scott and Co.

THE parliament so soon about to assemble has occasioned more speculation, excited more warmth, and created more intense anxiety, than any parliament convened within the memory of the existing generation, and appears pregnant with more important results than have sprung from any one recorded in the pages of our history, not even excepting that which restored in triumph, nor that which expelled in disgrace, the royal but ill-fated house of Stuart. The *Literary Gazette* is not political, and ours, thank Heaven, is a more peaceful sphere; but, in a season like this, we must feel in common with our countrymen; we must participate in their hopes and their fears; we must take a deep and vital interest in what so deeply and vitally affects all; in brief, we must, more or

less, inhale the atmosphere by which we are surrounded; and, feeling and breathing thus, we have no hesitation in acknowledging that we do entertain much anxiety regarding the new parliament, and that every thing appertaining to it is at this moment of great and absorbing interest. These observations have been called forth by the little unpretending volume we are about to recommend to our readers,—*The Assembled Commons*, which, though small and unassuming, comprises within its closely printed and well-digested pages as much information as could properly be collected upon so important a subject. It professes to be no more than a biographical epitome of the House of Commons; but the word epitome comprehends the connexions, pedigrees, influence (personal and family) of each individual member, and thus lays bare the springs by which, in all human probability, he is likely to be moved, the lights which are to guide him through the political labyrinth. But, to convey at once to our readers the skill and intelligence of the author, we shall conclude with a few specimens which, we have little doubt, will induce them to become better acquainted with him.

"*Morpeth, Viscount* (West Riding of Yorkshire).—Lord Morpeth, Chief Secretary to the Lord Lieutenant of Ireland, is the eldest son of the present Earl of Carlisle, nephew of the Duke of Devonshire, and grandson of Frederic, Lord Carlisle, the kinsman and guardian of Lord Byron. With a splendour of descent almost unequalled, in possession of the highest honours and of abundant wealth, his lordship has never relaxed in his efforts to deserve reputation by his personal worth. After a brilliant university career, Lord Morpeth entered upon public life, and has acquired fame in both the literary and political world. His direct ancestor, the celebrated Earl of Surrey, a poet of taste and refinement, at a period when our literature was rude and barbarous, married the Lady Frances Vere, daughter of John, Earl of Oxford, and had a son, Thomas, 4th Duke of Norfolk, who left three sons—Philip, progenitor of the ducal house, Thomas, Earl of Suffolk, and William, from whom descend the Earl of Carlisle, and the Howards of Corby Castle. Lord Morpeth was born April 18, 1802. (Castle Howard, Yorkshire.)"

"*Knight* (North Notts).—Henry Gally Knight, Esq. of Langold and Firbeck, was first elected for Nottinghamshire, in March 1835, and acts with the Tory party. The hon. gentleman has acquired literary reputation, and published, on his return from travelling in Greece, Syria, &c. a volume of poems under the title of "Eastern Sketches." He is only son of the late Henry Gally Knight, Esq. barrister-at-law, by Selina his wife, sister of Lord St. Helen's, and grandson of the Rev. Henry Gally, D.D. chaplain in ordinary to George II. distinguished among the literati of his day, who married Elizabeth, only sister and heir of Ralph Knight, Esq. of Langold, and granddaughter of Sir Ralph Knight of Langold, the parliamentarian. The Gallys were one of those refugee families which sought an asylum in England on the revocation of the edict of Nantes. Mr. Gally Knight succeeded to his extensive estates on the death of his father in 1803, and married Henrietta, youngest daughter and co-heir of Anthony Hardolph Eyre, Esq. of Grove. (Firbeck Hall, near Bawtry.)"

"*Mahon, Viscount* (Hertford).—Lord Mahon, Under Secretary of State for the Foreign Department during the continuance of Sir Robert Peel's government, is the son and heir of the

present Earl Stanhope, grandson of the late highly gifted earl, and nearly allied to the families of Cavendish, Grenville, and Pitt. The descendant of a race of distinguished ancestors, his lordship aspired early in life to literary reputation, and proved, by his 'Life of Belisarius,' and his 'History of the War of the Succession,' the solidity of the foundation upon which those aspirations were based. His great-grandfather was the celebrated General Stanhope, commander-in-chief of the British forces in Spain, towards the close of the eventful contest of which his descendant is the historian. That distinguished officer obtained considerable renown by the reduction of Port Mahon, in the island of Minorca, and was subsequently prime minister to George I. Lord Mahon was born Jan. 31, 1805, and married in 1834, Emily Harriet, daughter of Major-General Sir Edward Kerrison, Bart. (Cheverning, near Seven Oaks)."

"*Pakington* (Droitwich).—John Somerset Pakington, Esq. of Westwood House, the new member for Droitwich, is son of William Russell, Esq. of Powick Court, in the county of Worcester, by Elizabeth, daughter of Sir Herbert Perrot Pakington, Bart. of Westwood, and assumed his present surname as heir to his uncle, the late Sir John Pakington, Bart. He married Miss Slaney, and has issue. The founder of the fortunes of the house of Pakington was Sir John Pakington, a lawyer, who, in the reign of Henry VIII. was chirographer in the Court of Common Pleas, and died possessed of large acquired estates. His brother and heir, Robert Pakington, M.P. for London, was grandfather of Sir John Pakington,\* Queen Elizabeth's favourite. Sir Herbert Pakington, who, as well as his father and grandfather, represented Worcestershire, is said to have been the original from which Addison drew his imitable 'Sir Roger de Coverley.'"

"*Mackinnon* (Lymington).—William Alexander Mackinnon, Esq. of Portwood Park, Hants., chief of the clan Mackinnon in the Western Highlands of Scotland, possesses estates in the three kingdoms, and is a magistrate for the counties of Hants, Middlesex, and Essex. He was born in August 1790, and married, in 1812, Emma Mary, only daughter and heiress of Roger Palmer, Esq. of Palmerstown, in the county of Mayo: through this alliance, Mr. Mackinnon will eventually inherit extensive estates in the counties of Mayo, Sligo, and Dublin. The hon. gentleman's brother and uncle were both distinguished military men. The latter, General Mackinnon, lost his life in the storming of Ciudad Rodrigo; the former, Colonel Daniel Mackinnon, who commanded the Coldstream Guards, gallantly defended the farm of Hugoumont, at Waterloo, and was there severely wounded. The member for Lymington acts with the Tories, and, during the discussion on Reform, opposed the plan for taking the census of 1821 as the basis of repre-

\* "The following interesting anecdote is recorded of this eminent person. Having by this expensive mode of life contracted great debts, he took the wise resolution of retiring into the country, and said he would feed on bread and verjuice till he made up his extravagances; which, coming to the royal ear, the queen gave him a grant of a gentleman's estate in Suffolk, of eight or nine hundred a-year, which had escheated to the crown; but, after he had been there to take possession, he could not behold the miseries of that distressed family without regard and compassion; and the melancholy spectacle of the unhappy lady and her children so effectually wrought upon his feelings, that he repaired immediately to court, and humbly beseeched her majesty to excuse him from enriching himself by the calamities of a gentleman, who fell by a combination of his enemies,—and would not leave the queen till he had obtained his request, which involved the restoration of the property to the rightful owner."

sentation. He formerly sat in parliament for Dunwich. (Portswood Park, near Southampton.)

**"Maclean (Oxford).—**Donald Maclean, Esq. of the chancery bar, is second son of Lieutenant-General Sir Fitzroy Grafton Maclean, Bart., of Morvaren, and descends from a family pre-eminently distinguished in the military annals of Scotland. During the civil war, Sir Lachlan Maclean participated in all the triumphs of the great Marquess of Montrose; and under Dundee, Sir John Maclean, with his clan, fought at Killcrankie. In the rising of '15 the same devoted adherent of the Stuarts again enrolled himself under the banner of the de-throned family, and, joining the Earl of Mar, was with that nobleman at Sheriffmuir. The member for Oxford sits for the second time in parliament, and advocates Tory measures. He married, in 1827, Harriet, daughter of General Frederick Maitland, and cousin to the Earl of Lauderdale.

**"Kemble (Surrey, E).—**Henry Kemble, Esq. of Camberwell, stood with Capt. Alsager, on the Tory interest, and defeated, after a severe contest, the Whig candidates, Messrs. King and Angerstein. The father of the hon. member was a tea-broker in the city of London, and well-known as 'Mr. Deputy Kemble,' having held the situation of deputy to the alderman of Cordwainers' ward. At his death, he left considerable property and the business to his two sons, who continued in it until recently, when each retired with a large fortune. (Camberwell, Surrey.)

**"Lewis (Maidstone).—**Wyndham Lewis, Esq. of Greenmeadow, in Glamorganshire, barrister-at-law, son of the Rev. Wyndham Lewis, was elected member for Cardiff in 1820, for Aldburgh in 1827, and for Maidstone first in 1835. He possesses estates in the counties of Glamorgan, Monmouth, Gloucester, and Somerset, and descends from ancestors conspicuous in the most remote period of British history. The chief line, the Lewises of the Van, terminated in an heiress who married the Earl of Plymouth, but the Lanishen branch, from which the hon. member springs, has preserved a male succession. Mr. Lewis was born Oct. 7, 1780, and married in 1815, Mary Anne, only daughter of John Evans, Esq. He acts with the Tories. (Greenmeadow, near Cardiff.)

**"D'Israeli (Maidstone).—**Benjamin D'Israeli, Esq. jun. the new member for Maidstone, offered himself in 1833 and 1834 for the borough of Wycombe, near which town his family reside; but was, each time, defeated by the Hon. Colonel Grey. His politics are Tory. The hon. gentleman is the eldest son of the author of the 'Curiosities of Literature,' and has become himself distinguished as the writer of several works of fiction, 'Vivian Grey,' 'Constanini Fleming,' &c. The member for Maidstone's grandfather was an Italian merchant, of Jewish extraction."

From all these, it will be seen that the biographical notices have not only the excellent quality of being sufficient for the purpose, but the rarer and better one of being unpolitical, impartial, and unprejudiced.

**Chelsea Hospital, and its Traditions.** By the Author of "The Subaltern," "The Country Curate," &c. 3 vols. 12mo. London, 1837. Bentley.

PUBLISHED at a late hour in our week, we have yet had only time to take a light-horse gallop over these interesting pages; but we have observed enough to see that great pleasure is before us when we shall have time to take a

slow and steady infantry march through them, from the opening to the close. After a curious historical and traditional account of the origin and progress of Chelsea Hospital, Mr. Gleig launches into stories connected with, or by the names of, some of its earliest inmates, when converted from a theological college, of the time of James I., to an asylum for aged, maimed, and wounded warriors, at the suggestion of Nell Gwynne, by Charles II. A tale of Pontefract Castle, and another of the rising in Kent, admits of striking pictures of the civil wars; and the occupation of Tangiers, and the wars with the Moors, during more than twenty years, are described with a fidelity and vividness which most happily combines national history with individual adventure. It is particularly attractive at this time, when France is playing so nearly similar a game in Africa; and also particularly appropriate, since it was as a provision for the veterans returned from Tangier that Chelsea Hospital was militarily endowed. Then we have in succession admirable accounts of the campaign of Blenheim, and so on till the immortal field of Waterloo concludes the series. The fine invention of the author has supplied the personal and imaginative scenes, and entwined them so naturally with the leading events of the periods he has chosen, that we cannot but believe the whole to be true; and the pensioners, whom he has again endowed with life, and whose lives, thus re-created, he has diversified with such stirring and affecting incidents, to have actually said, done, and endured all that he has told. Thus founded on a solid basis of official\* and statistical information, linked with less certain but more piquant traditions, and the outline filled up and peopled with delightful skill, we may safely predict that this work will not only be immediately popular, but will have a continuance of popularity, long extended beyond the usual era of the class of publication under which it seems to range.

**Key's Works, chiefly Edinburgh Portraits, with Biographical Sketches.** Part I. Edinburgh, Paton; London, Smith, Elder, and Co.

In the Fine Arts' department of our Number for Sept. 30, we mentioned this curious and characteristic publication, and stated our intention to take an early opportunity of advertizing to the biographical sketches which it contained. We think we cannot redeem this pledge more amusingly to our readers, than by extracting a few anecdotes of the whimsical and distinguished personages who are the subjects of the sketches in question.

**James Robertson, the Daft† Highland Laird.**—"There was one darling wish of his heart that clung to him for many a day, which certainly it was not very easy to gratify. This was his extreme anxiety to be hanged, drawn, and quartered, as a rebel partisan of the house of Stuart, and a sworn and deadly foe to the reigning dynasty. He was sadly annoyed that nobody would put him in jail as a traitor, or attempt to bring him to trial. It would have been a partial alleviation of his grief, if he could have got any benevolent person to have accused him of treason. It was in vain that he drank healths to the Pretender—in vain that he bawled treason in the streets; there was not one who would lend a helping-hand to procure him the enjoyment of his pains and penalties. The laird, although he uniformly insisted on

being a martyr to the cause of the chevalier, seemed to feel that there was something wanting to complete his pretensions to that character—that it was hardly compatible with the unrestrained liberty he enjoyed, the ease and comfort in which he lived, and the total immunity from any kind of suffering which was permitted him; and hence his anxiety to bring down upon himself the vengeance of the law. Failing, however, in every attempt to provoke the hostility of government, and thinking, in his despair of success, that if he could once again get within the walls of a jail, it would be at any rate something gained; and that his incarceration might lead to the result he was so desirous of obtaining, he fell on the ingenious expedient of running in debt to his landlady, whom, by a threat of non-payment, he induced to incarcerate him. This delightful consummation accordingly took place, and the laird was made happy by having so far got, as he imagined, on the road to martyrdom. It was a very easy matter to get the laird into jail, but it was by no means so easy a one to get him out again; indeed, it was found next to impossible. No entreaties would prevail upon him to quit it, even after the debt for which he was imprisoned was paid. There he insisted on remaining until he should be regularly brought to trial for high treason. At last a stratagem was resorted to, to induce him to remove. One morning two soldiers of the town-guard appeared in his apartment in the prison, and informed him that they had come to escort him to the Justiciary Court, where the judges were assembled, and waiting for his presence, that they might proceed with his trial for high treason. Overjoyed with the delightful intelligence, the laird instantly accompanied the soldiers down stairs, when the latter, having got him fairly outside of the jail, locked the door to prevent his re-entering, and deliberately walked off, leaving the amazed and disappointed candidate for a halter to reflect on the slippery trick that had just been played him."

**Lord Kames.**—"Notwithstanding the general gravity of his pursuits, his lordship was naturally of a playful disposition, and fond of a harmless practical joke, of which a curious instance is on record. A Mr. Wingate, who had been his private tutor in early life, but who had by no means made himself agreeable to him, called upon him, after he had become eminent in his profession, to take his opinion regarding the validity of certain title-deeds which he held for a sum of money advanced on land. The lawyer, after carefully examining them, looked at his old master with an air of the most profound concern, and expressed a hope that he had not concluded the bargain. The alarmed pedagogue, with a most rueful countenance, answered that he had; when Mr. Home gravely proceeded to entertain him with a luminous exposition of the defects of the deeds, shewing, by a long series of legal and technical objections, that they were not worth the value of the parchment on which they were written. Having enjoyed for some time Wingate's distress, he relieved the sufferer by thus addressing him: 'You may remember, sir, how you made me smart in days of yore for very small offences: now, I think our accounts are closed. Take up your papers, man, and go home with an easy mind: your titles are excellent.' Amongst his lordship's singularities, which were not a few, was an unaccountable predilection for a certain word, more remarkable for its vigour than its elegance, which he used freely even on the bench, where it certainly must have sounded very oddly. This peculiarity is pointed out in

\* Lord John Russell liberally opened these sources of intelligence to Mr. Gleig, of which he has made so good a use.—Ed. L. G.

† "Daft" means deranged.

the amusing poem, entitled the 'Court of Session Garland,' by James Boswell—

'Alamoor the judgment as illegal blarney.  
'Tis equity, you b—h,' replies Lord Kames.'

About a week before his death, which was the result of extreme old age, feeling his end approaching, he went to the Court of Session, addressed all the judges separately, told them he was speedily to depart, and bade them a solemn and affectionate farewell. On reaching the door, however, he turned round, and bestowing a last look on his sorrowing brethren, made his exit, exclaiming, 'Fare ye a' weel, ye b—ches!'

*Hugo Arnot, Esq.*—"In his professional capacity, he was guided by a sense of honour and of moral obligation, to which he never scrupled to sacrifice his interests. He would take in hand no one cause, of the justice and legality of which he was not perfectly satisfied. On one occasion, a case being submitted to his consideration which seemed to him to possess neither of these qualifications—"Pray," said he, with a grave countenance, to the intending litigant, 'what do you suppose me to be?' 'Why,' answered the latter, 'I understand you to be a lawyer.' 'I thought, sir,' said Arnot, sternly, 'you took me for a scoundrel!' The man withdrew, not a little abashed at this plump insinuation of the dishonesty of his intentions. On another occasion, he was waited upon by a lady, not remarkable either for youth, beauty, or good temper, for advice as to her best method of getting rid of the importunities of a rejected admirer; when, after telling her story, the following colloquy took place:—"Ye maun ken, sir," said the lady, 'that I am a namesake o' your ain. I am the chief o' the Arnots.' 'Are you, by Jing?' replied Mr. Arnot. 'Yes, sir, I am; and ye maun just advise me what I ought to do with this impertinent fellow.' 'Oh, marry him, by all means! It's the only way to get quit of his importunities.' 'I would see him hanged first!' replied the lady, with emphatic indignation. 'Nay, madam,' rejoined Mr. Arnot; 'marry him directly, as I said before; and, by the lord Harry! he'll soon hang himself.' The severe asthmatic complaint with which he was afflicted subjected him, latterly, to much bodily suffering. When in great pain, one day, from difficulty of breathing, he was annoyed by the bawling of a man selling sand in the streets. 'The rascal!' exclaimed the tortured invalid, at once irritated by the voice, and envious of the power of lungs which occasioned it, 'he spends as much breath in a minute as would serve me for a month!' Mr. Arnot had a habit of ringing his bell with great violence—a habit which much annoyed an old maiden-lady who resided in the floor above him. The lady complained of this annoyance frequently, and implored Mr. Arnot to sound his bell with a more delicate touch: but to no purpose. At length, annoyed in turn by her importunities, which he believed to proceed from mere querulousness, he gave her to understand, in reply to her last message, that he would drop the bell altogether. This he accordingly did; but in its place substituted a pistol, which he fired off whenever he desired the attendance of his servant, to the great alarm of the invalid, who now as earnestly besought the restitution of the bell as she had requested its discontinuance."

*Lord Gardenstone.*—"In his dress his lordship was exceedingly plain; a circumstance which gave rise to an incident highly characteristic of him, which occurred at one time when he was returning from London. Ob-

serving some young bucks taking inside tickets for the coach in which he was about to travel, he took his for the outside. On arriving at the end of the stage, where the passengers were to breakfast, his lordship, who had been shewn into an inferior room, while his better-dressed fellow-travellers were conducted to the best, called the waiter, and desired him to carry his compliments to the young gentlemen, on whose philanthropy it was his object to make an experiment, and to request that they would permit him to have the honour of breakfasting with them. To this message, precisely such an answer was returned as his lordship expected. It was, that the gentlemen above stairs kept no company with *outside* passengers. Lord Gardenstone made no reply, but desired the waiter to bring him a *magnum bonum* of claret, and to send the landlord to share it with him; concluding with an order to get a post-chaise and four ready for him immediately. These commands, which very much amazed both mine host and his man, having been in due time complied with, his lordship paid his bill and departed; giving orders, previously, to his coachman, so to manage as to arrive at the stage where his former fellow-travellers would dine precisely at the same time with them, that they might witness the respect which should be paid to him by the landlord, to whom he was known. All this the young bucks accordingly saw, and, having set on foot some inquiries on the subject, they soon discovered their mistake. With the view of atoning for their incivility, they now sent a polite card to Lord Gardenstone, begging his pardon for what had happened in the morning, which they attributed to their ignorance of his quality, and requesting it, as a particular favour, that he would honour them with his company to dinner. To this polite card his lordship returned a verbal answer, that 'he kept no company with people whose pride would not permit them to use their fellow-travellers with civility.'"

*Dr. Glen.*—"He had made a fortune abroad, in the practice of his profession; and, in his latter years, returned to his native country—not to enjoy it. He was twice married. On the second occasion, he had attained the discreet age of seventy; and it is said that, amongst the other soft and captivating things which the venerable lover whispered into the ear of the young lady on whom his choice had fallen, to induce her to receive his addresses, was the promise of a carriage. To this promise the doctor was faithful. The carriage was got, but no horses. 'That's more than I bargained for,' said the doctor; 'I promised a carriage, and there it is: but I promised no horses, neither shall you have them.' And here again the doctor was as good as his word. The consequence was a quarrel with his young wife, aggravated by certain attempts on her part to revolutionise his house. The result may be anticipated: three weeks after the marriage a separation took place, by mutual consent, the husband settling a sufficient alimony on his affectionate spouse."

"Being once troubled with sore eyes, after in vain trying the prescriptions of several physicians, he applied to Dr. Graham, who cured him in a very short time; for which he expressed great gratitude. Wishing to make him some remuneration, he consulted some of the young members of the faculty; and, as the most genteel way of doing what he wished, they recommended him to invite the doctor and a few of his own friends to dinner at Fortune's (the most fashionable tavern at that

time), and provide himself with a handsome purse, containing thirty guineas or so, and offer it to the doctor; which, they assured him, he would not accept. They accordingly met, and, after a few bottles of wine had been drunk, the old doctor called Dr. Graham to the window, and offered him the purse; which he at once accepted, and, with a very low bow, thanked him kindly for it. The doctor was so chagrined that he soon left the company, who continued till a pretty early hour enjoying themselves at his expense."

We wish we could give similar specimens of the plates; which, however, we repeat, are highly amusing.

#### *Lane's Modern Egypt.*

[Fourth and concluding notice.]

MUCH as we have been indebted to this work, and generally as it is now known throughout the reading world, we cannot finally take leave of it, without referring to a few parts of the second volume. The hatching of eggs by artificial heat in Egypt is practised to a considerable extent, there being above a hundred establishments for carrying on the process in Lower, and fifty in Upper Egypt. The peasants have a chicken for every two eggs he gives in; and, in March 1831, the general national account stood as follows:

#### "Statement.

	Lower Egypt.	Upper Egypt.
Number of establishments for the hatching of fowls' eggs in the present year . . . . .	103	50
Number of eggs used . . . . .	19,325,000	6,674,900
Number spoiled . . . . .	6,255,957	2,529,580
Number hatched . . . . .	13,069,733	4,345,320

The chapter on Egyptian street cries is very curious; and so is that upon games. Draughts, we observe, are called *da'meh*: in Scotland, they are called *dams*, and the board, the *dam-board*. In *Sae'ga*, another game, played with holes in the ground, the holes are denominated '*oyoo'n*'—eyes in the plural, and in the singular, '*ey'n*'—almost the Scottish *cen*. Mr. Lane holds, that the gipsies and dancing girls are not an Egyptian race. Their race is involved in obscurity; but they say they are of the famous Bernecide family "of the Arabian Tales," which is, probably, a vain boast. Music, and religious fêtes and festivals, are treated with great interest and ability. Among the latter, the '*Fe'sa'wee'yeh durwee'shes* are remarkable, and our author says—

"Before I describe the performances of the '*Fe'sa'wee'yeh*, I should mention, that they are a class of *durwee'shes*, of whom all, or almost all, are *Mugh'reb'ees*, or Arabs of Northern Africa, to the west of Egypt. They derive their appellation from the name of their first sheykh, '*Fe'sa*, which is the Arabic name of Jesus, and not uncommon among *Moos'lins*, as they acknowledge and venerate the Messiah. Their performances are very extraordinary, and one is particularly remarkable. I was very anxious that they should perform, this night, what I here allude to; and I was not disappointed, though I was told that they had not done it in Cairo for several years before. I found about twenty of these *durwee'shes*, variously dressed, sitting upon the floor, close together, in the form of a ring, next to the front wall of the building. Each of them, excepting two, was beating a large *ta'r* (or tambourine), rather more than a foot in width, and differing from the common *ta'r*, in being without the tinkling pieces of metal which are attached to the hoop of the latter. One of the two persons mentioned as exceptions was beating a small *ta'r* of the common kind; and the other, a *ba'z*, or little kettle-drum. Before this

ring of durwee'shes, a space, rather larger than that which they occupied, was left by the crowd for other durwee'shes of the same order; and soon after the former had begun to beat their tambourines, the latter, who were six in number, commenced a strange kind of dance; sometimes exclaiming 'Al'la'h!' and sometimes, 'Al'la'h Mowla'na!' ('God is our Lord!'). There was no regularity in their dancing; but each seemed to be performing the antics of a madman: now, moving his body up and down; the next moment, turning round; then, using odd gesticulations with his arms; next, jumping; and sometimes, screaming: in short, if a stranger, observing them, were not told that they were performing a religious exercise, supposed to be the involuntary effect of enthusiastic excitement, he would certainly think that these dancing durwee'shes were merely striving to excel one another in playing the buffoon: and the manner in which they were clad would conduce to impress him with this idea. One of them wore a kuftha'n without sleeves, and without a girdle, and had nothing on his head, which had not been shaved for about a week: another had a white cotton scull-cap, but was naked from the head to the waist, wearing nothing on his body but a pair of loose drawers. These two durwee'shes were the principal performers. The former of them, a dark, spare, middle-aged man, after having danced in his odd manner for a few minutes, and gradually become more wild and extravagant in his actions, rushed towards the ring formed by his brethren who were beating the ta'ra. In the middle of this ring was placed a small chafing-dish of tinned copper, full of red-hot charcoal. From this, the durwee'sh just mentioned seized a piece of live charcoal, which he put into his mouth; then did the same with another, another, and another, until his mouth was full; when he deliberately chewed these live coals, opening his mouth very wide every moment, to shew its contents, which, after about three minutes, he swallowed; and all this he did without evincing the slightest symptom of pain, appearing, during the operation, and after it, even more lively than before. The other durwee'sh, before alluded to as half naked, displayed a remarkably fine and vigorous form, and seemed to be in the prime of his age. After having danced not much longer than the former, his actions became so violent, that one of his brethren held him; but he released himself from his grasp, and, rushing towards the chafing-dish, took out one of the largest live coals, and put it into his mouth. He kept his mouth wide open for about two minutes, and during this period, each time that he inhaled, the large coal appeared of almost a white heat; and when he exhaled, numerous sparks were blown out of his mouth. After this, he chewed and swallowed the coal, and then resumed his dancing. When their performance had lasted about half an hour, the durwee'shes paused to rest. Before this pause, another party of the same sect had begun to perform, near the centre of the great portico. Of these, I now became a spectator. They had arranged themselves in the same order as the former party. The ring, composed by those who beat the tambourines, consisted of about the same number as in the other company; but the dancers here were about twelve, sometimes less. One of them, a tall man, dressed in a dark woollen gown, and with a bare, shaven head, took from the chafing-dish, which was handed to the dancers, as though it had been a dish of cakes or sweetmeats, a large piece of brilliantly hot coal;

placed it between his teeth, and kept it so for a short time; then drew it upon his tongue, and, keeping his mouth wide open for, I think, more than two minutes, violently inhaled and exhaled, shewing the inside of his mouth like a furnace, and breathing out sparks, as the former durwee'sh had done, but with less appearance of excitement. Having chewed and swallowed the coal, he joined the ring of the tambourine-players, and sat almost close to my feet. I narrowly watched his countenance, but could not see the least indication of his suffering any pain. After I had witnessed these extraordinary performances for about an hour, both parties of durwee'shes stopped to rest; and, as there was nothing more to see worthy of notice, I then quitted the mosque. Sometimes, on this occasion, the 'Ee'sa'wee'yeh eat glass as well as fire. One of them, the hba'gg Mohham'mad Es-Sela'wee, a man of gigantic stature, who was lamp-lighter in the mosque of the Hhasaney'n, and who died a few years ago, was one of the most famous of the eaters of fire and glass, and celebrated for other performances. Often, when he appeared to become highly excited, he used to spring up to the long bars, or rafters of wood, which extend across the arches above the columns of the mosque, and which are sixteen feet or more from the pavement; and would run along them, from one to another: then, with his finger, wetted in his mouth, he would strike his arm, and cause blood to flow, and by the same means staunch the blood."

The description of the Nile rising, and the cutting of the canal, is worthy of particular attention; but we must pass on to one of the ceremonies on infancy.

"On the Yo'm es-Soo'boo'â (or Seventh Day) after the birth of a child, the female friends of its mother pay her a visit. In the families of the higher classes, 'Awa'lim are hired to sing in the hharee'm, or A'la'tee'yeh perform, or fiek'ees recite a khut'meh, below. The mother, attended by the da'yeh, sits on the koor'see el-wila'deh, in the hope that she may soon have occasion for it again; for her doing this is considered propitious. The child is brought, wrapped in a handsome shawl, or something costly; and, to accustom it to noise, that it may not be frightened afterwards by the music, and other sounds of mirth, one of the women takes a brass mortar, and strikes it repeatedly with the pèste, as if pounding. After this, the child is put into a sieve and shaken, it being supposed that this operation is beneficial to its stomach. Next, it is carried through all the apartments of the hharee'm, accompanied by several women or girls, each of whom bears a number of wax candles, sometimes of various colours, cut in two, lighted, and stuck into small lumps of paste of hhen'na, upon a small round tray. At the same time the da'yeh, or another female, sprinkles, upon the floor of each room, a mixture of salt and seed of the fennel-flower, saying, as she does this, 'The salt be in the eye of whoever does not bless the prophet!' or, 'The foul salt in the eye of the envious!' This ceremony of the sprinkling of salt is considered a preservative, for the child and mother, from the evil eye."

How would our English mothers like their offspring to be sifted in a sieve? At the period of death, as at that of birth, there are several striking observances. The ima'm at the mosque stands beside the bier of the dead, and, among other prayers, says, in a fine scriptural language—

"O God, verily this is thy servant, and son of thy servant: he hath departed from the re-

pose of the world, and from its business, and from whatever he loved, and from those by whom he was loved in it, to the darkness of the grave, and to what is prepared for him. He did testify that there is no deity but Thee: that Thou hast no companion: and that Mohham'mad is thy servant and thy apostle: and Thou art all-knowing respecting him. O God, he hath gone to abide with Thee: and Thou art the best with whom to abide. He hath become in need of thy mercy; and Thou hast no need of his punishment. We have come to Thee supplicating that we may intercede for him. O God, if he were a doer of good, over-reckon his good deeds; and if he were an evil-doer, pass over his evil-doings, and of thy mercy grant him thy acceptance, and spare him the trial of the grave, and its torment; and make his grave wide to him, and keep back the earth from his sides;" and of thy mercy grant him security from thy torment, until Thou send him safely to thy Paradise, O Thou most merciful of those who shew mercy!"

We lament that we cannot even enter upon the important supplement which treats of the Copts, now only about a fourteenth of the population of Egypt, or some 15,000, though evidently very numerous a few centuries ago. They are the descendants of the ancient Egyptians, though not an unmixed race: the Nubians, and next to them the Abyssinians, bearing the strongest resemblance to the original people. The mummies prove this. Among their singular tenets, we may briefly notice, that—

"It is a prevailing belief among the Copts, that, if a child die unbaptised, it will be blind in the next life, and the parents are held guilty of a sin, for which they must do penance, either by repeating many prayers, or by fasting."

"The Coptic language gradually fell into disuse after the conquest of Egypt by the Arabs. For two centuries after that event, it appears to have been the only language that the generality of the Copts understood; but before the tenth century of our era, most of the inhabitants of Lower Egypt had ceased to speak and understand it; though, in the Sa'ee'd (or Upper Egypt), El-Muckree'zee tells, the women and children of the Copts, in his time (that is, about the close of the fourteenth century of our era, or the early part of the fifteenth), scarcely spoke any other language than the Sa'ee'dee Coptic, and had a complete knowledge of the Greek. Soon after this period, the Coptic language fell into disuse in Upper Egypt, as it had done so long before in the Lower Provinces; and the Arabic was adopted in its stead. All the Copts who have been instructed at a school still pray, both in the church and in private, in Coptic; and the Scriptures are still always read in the churches in that language; but they are explained, from books, in Arabic. Many books, for the use of priests and other persons, are written in the Coptic language, expressed in Arabic characters."

"The Copts are not now despised and degraded by the government, as they were a few years ago. Some of them have even been raised to the rank of Bays."

"One of the most remarkable traits in the character of the Copts is their bigotry. They bear a bitter hatred to all other Christians; even exceeding that with which the Moos'lims regard the unbelievers in el-Isa'm. Yet they

"It is believed that the body of the wicked is painfully oppressed by the earth against its sides in the grave, though this is always made hollow."

are considered, by the Moslems, as much more inclined than other Christian sects to the Mohammedan faith—and this opinion has not been formed without reason,—for vast numbers of them have, from time to time, and not always in consequence of persecution, become proselytes to this religion. They are, generally speaking, of a sullen temper, extremely avaricious, and abominable dissemblers; cringing or domineering according to circumstances."

A second and shorter supplement relates to the Jews;\* of whom, however, there are only about 5000 in the land, and these chiefly in Cairo, residing in a close and dirty quarter of the metropolis. But we must now take our leave of this truly valuable work, in which information and amusement are so intimately blended, and so pervading, that we could not turn any two pages without finding them both. So long as Egypt remains a country, so long will Mr. Lane's volumes be consulted, as a curious and faithful picture of its past history and existing form at the beginning of the nineteenth century.

#### MISCELLANEOUS.

*The Oriental Annual, or Scenes in India.* By the Rev. Hobart Caunter. 1838. Churton. This volume is exactly what it has been every preceding year. It is scarcely possible to imagine a more beautiful work: the binding is perfect; and, provided its readers (pardon the bull) never read it, the whole would be unexceptionable. But we cannot imagine what ever induced Mr. Hobart Caunter to turn author, he not having one single natural requisite for the calling. He has neither invention nor style. By diffuse reading, he collects together a vast quantity of material, and, out of that, he constructs his annual. His books always put us in mind of a story told of one of our modern dramatists. A friend called on him one day, found him with a large pair of scissors in his hand, and a number of books lying open before him. His friend spoke—no answer—he spoke. "Hush," exclaimed the author; "don't you see that I am composing." Now, Mr. Hobart Caunter composes on exactly similar principles.

*The Poetical Works of Thomas Campbell.* Pp. 306. London, Moxon.

A BEAUTIFULLY got up edition of this popular poet, with charming engravings; and, altogether, doing honour to the publisher, though he has already given us so many elegant and delightful works.

*The Flora of Jamaica; a Description of the Plants of that Island, &c. &c.* By James Macfayden, M.D. 8vo. pp. 351. London, Longman and Co.; Edinburgh, A. and C. Black; Glasgow, Smith and Son.

A VERY full and satisfactory filling up of a botanical desideratum, which has long been felt by the scientific world. In every point of view, and not the least as it regards the medical properties of plants, many of them very little known, this volume is well worthy of public attention.

*The Life and Times of the Rev. G. Whitfield, M.A.* By R. Philip, author of "The Experimental Guides," &c. 8vo. pp. 588. London, 1837. Virtue.

THESE records of Reed's "Seraphic Man" are chiefly compiled from his own pen; and what

\* Some months ago we received the following note from an anonymous hand:—"Mehemet Ali has, within the last four years, evinced the most generous disposition towards the Jews and Christians who are subject to his sway, and who were previously exposed to the rapacity of some local authorities in Lybia, Palestine, and Egypt."

is added, either for connexion or in further elucidation of circumstance, is done in his own spirit. It is a striking narration, and shews what may be done by the energy of one remarkable and enthusiastic individual.

*Lodge's Genealogy of the Peerage.* Saunders and Otley.

A SIXTH edition, and well meriting to run on to a sixteenth.

*Hints to Mothers, &c.,* by Dr. Thomas Bull, &c. Pp. 175. (London, Longman and Co.)—An accoucheur subject we cannot meddle with.

*The Three Opinions: Tory, Whig, Radical,* by A. C. Jobert. Pp. 96. (London, Wilson.)—A pamphlet on the Radical side, with some truisms and some deductions not warranted by their premises.

*The Student's Companion to Apothecary's Hall,* by E. Oliver. Pp. 189. (London, Churchill.)—A useful little guide for apothecaries, druggists, &c. to the Pharmacopoeia of 1836.

*The Book of Banners.* Pp. 48. (Windsor, Brown.)—A metrical description of the armorial bearings of all the knights of the garter, some of whom seem to have arms and mottoes not inapplicable to them; but others, such as would far better fit the original grantees than their living successors. So much so, indeed, as to be ludicrous, and almost satirical. The design, however, is ingenious, and the lines afford good aid to the memory.

*Dr. Elliott's Human Physiology, Part II., containing the Animal Functions.* (London, Longman and Co.)—The words "fifth edition" in this, as in other similarly fortunate cases, may well stand for our critique.

#### ORIGINAL CORRESPONDENCE.

To the Editor of the Literary Gazette.

October 24, 1837.

SIR,—In Prior's "Life of Goldsmith," vol. ii. p. 210, occurs the following passage:—"In the commencement of the present century, a short letter, dated from the Isle of Wight, signed with the letter D., and addressed to the editor of a newspaper, introduced the following lines as a production of Goldsmith; and they have, in consequence, been included in some late editions of his works, though, the authority being anonymous, they are not admitted into that which accompanies these volumes.

"'E'en have you seen bath'd in the morning dew  
The budding rose its infant bloom display,  
When first its virgin tints unfold to view,  
It shrinks, and scarcely trusts the blaze of day.  
So soft, so delicate, so sweet she came,  
Youth's dawning glow just dawning on her cheek;  
I gaw'd, I sigh'd, I caught the tender flame,  
Felt the fond pang, and droop'd with passion weak."

Now, sir, I think I may say it is quite evident that this can be but a fragment, whoever was the author. I find, however, the latter of these two stanzas forming the conclusion of a very beautiful glee of Stafford Smith's.

"Return, blest days, return, ye laughing hours,  
Which led me up the roscate steep of youth,  
Which strew'd my simple path with vernal flow'rs,  
And bade me court chaste Science and fair Truth!

Witness, ye winged daughters of the year,  
If e'er a sigh had learnt to heave my breast,  
If e'er my cheek was conscious of a tear,  
Till Cynthia came, and robb'd my soul of rest.  
So soft, so delicate, so sweet," &c. &c.

Stafford Smith, like all other composers, took only those parts of the poem which were available for the purposes he had in view; he has, therefore, omitted the stanza, "E'en have you seen," &c.; but if you restore it to its place, the four stanzas appear to form a perfect piece; the "Cynthia" of the second stanza being the *she* of the fourth, *who came so soft, so delicate, so sweet*, &c. This glee of Stafford Smith's gained the prize in 1777, and on the copy which I have, the words are said to be by Dr. Percy. I have no copy by me of Dr. Percy's works, and cannot investigate the matter further; but there seems to be one circumstance in favour of this appropriation. Dr. Percy became Bishop of Dromore in 1782; since which he has been universally designated as *Bishop Percy*; but, as on the copy of the glee above-mentioned, he is called Dr. Percy, I am inclined

to believe that the lines were known to be his, before he became a bishop; and, therefore, at a time when the authorship could not be doubtful.

At page 309 of the same volume, you will find the following in a note:—

"Hannah More, in her correspondence, points strongly to the jealous temper of Cumberland. To Wm. Gray, Esq. of York, she writes, August 14, 1809:—"I have never written, and, by the grace of God, I never will write a line in my own vindication, though Mr. Cumberland, in his last review, talks of my suckling babes of grace, and making hell-broth; advises the bishop against a book which is intended to overturn the church; that the deepest mischiefs lurk in every page of 'Coclebs'; and, as the book is in every body's hands, he feels it his duty to say, *caveat emptor*. My dear sir, shall I not pity the poor man, on the borders of fourscore, who could write such a criticism, after having written a poem called 'Calvary'? Alas! poor human nature, that he has not forgiven, at the end of thirty years, that, in my gay and youthful days, a tragedy of mine was preferred to one of his, which, perhaps, better deserved success."

I have not had courage to attack Mr. Roberts's interminable work, and cannot refer to it at the moment; I must, therefore, take it for granted, that the above is a correct quotation. Now, would not any one, on reading it, conclude that Hannah More had seen the critique in question, and had stated nothing more than fact? Such, however, is far from being the case. She is not spoken of, as making hell-broth, nor did Cumberland write a syllable of the article. He was, certainly, in a very high degree responsible for all that appeared in a review of which he was editor; but he avoided much responsibility by prefixing to every article in his review the name of the writer. Had, then, Hannah More seen the review of which she complains, she would have been informed that the real culprit was Mr. G. H. Crowe, eldest son of the late public orator at Oxford. In the year 1811 or 1812, when I was a mere lad, the book was lent to me by a brother of Mr. Crowe's, and, being much amused with it, I took the trouble to copy the whole of the article, which MS. I have now lying before me. The truth appears to be that (to use a vulgar expression) there was *no love lost* between Cumberland and Hannah More; that he omitted no opportunity of giving her a slap; and, in the present instance, he was delighted at finding a young author, who, whatever were his critical powers, certainly wielded the weapon of ridicule with tolerable success,—and that *she* was not behind in retaliating upon him; but as this was always done in a spirit of meekness and christian charity, it was not necessary to be so over scrupulous as to verify to the letter the facts with which she charged him.—I am, &c., F. B.

As a specimen of Mr. Crowe's critique, I copy the parts in which he talks about *suckling babes of grace* and *making hell-broth*. See the quotation above, from Hannah More's letter to Mr. Gray.

"There is a sort of quackery in all trades, which is well understood in the present day; and it is wonderful how easily the public is allured by it—how easily deceived by shadows, and imposed on by appearances. The keeper of a lottery office hires a man with a lucky name to be his partner; the publican takes advantage of popular enthusiasm, and invites customers by adopting for his sign the favourite hero of the day; the practised dealer in literature acts on the same principle. To have fairly

and candidly entitled the work now under consideration, "Serious Dialogues on Faith and Good Works" (and, in fact, this is the only title which can with propriety be given to it), would neither have answered the author's nor the bookseller's purpose. The sale would have been chiefly confined to that particular class of whom the author may justly be considered the principal luminary; and, as they are already enlightened on the subject which the work discusses, to them it would neither have been new nor necessary. But the author had, probably, good reason to know, that there is a much more numerous class of persons, to whom a bachelor in search of a wife is an object of the highest interest; that such persons devour, with the greatest avidity, every thing which is presented to them in the shape of a novel, and that their appetites would be rendered still keener, where the present pleasure would be heightened by the anticipation of future profit; where, in fact, they might expect to learn what in such a search a bachelor would be most likely to look for, and might prepare themselves accordingly. Nor could it escape observation, that this curiosity would be greatly heightened, if the work were represented to be the production of one, whose opinion on such a subject, any peculiar circumstances of character or conduct might have rendered particularly interesting. For such a purpose, no name could have been so happily chosen as that of Miss Hannah More, whose wisdom, virtue, and piety, have been held forth as patterns which people would do well to imitate, but could scarcely hope to equal; who, after a long life of unrelenting celibacy (let the world say what it will), is still the good Miss Hannah, propagating nothing but novels for conventicles, and suckling none but babes of grace with the pure milk of Divine love. It must be evident, how eagerly the supposed opinion of such persons on such a subject would be consulted; most people would be curious to know her thoughts on a matter respecting which there was so little reason to suppose she had thought at all. It is immaterial to the question, whether Miss More is in reality the author of the work; it was sufficient to produce the necessary effect that she is the reputed author. Yet even her name would not have given circulation to the work, but for the false colours under which it was launched. Cœlebs would have sought a wife to little purpose, perhaps, had he not been reported to be the offspring of Miss Hannah; and her offspring would not have been noticed at all, had he not assumed an appearance and title to which he has not the least pretension. By this combination, however, the opinions and principles of the author, whoever the author may be, have been more widely disseminated than they could have been in any other way; for they were presented under a disguise which excited no suspicion, and have been, in consequence, admitted into all company. Yet it is difficult to reconcile such a proceeding with the express declaration of the author, that there is no such thing as a harmless falsehood (vol. ii. p. 92); that even if by falsehood a life could be preserved, or one's country saved, a lie would not be allowable (p. 94). Now, though it would be a want of charity to suppose that the author's motives for deviating from the strict rule here laid down were not in themselves well intentioned, it would be a want of common sense not to perceive the deviation. That which, from the title, would be concluded to be the principal subject of the work, forms the least and most subordinate part of it; on the same principle, the whole tragedy of Macbeth, because it contains the witches' in-

cantation over their caldron, might be hashed up into some new system of domestic cookery, and entitled, a *curious receipt to make hell-broth*. The author is aware of these objections, and attempts a defence; but no defence had been necessary, had no deception been practised. The reader is told, "that he must not look for adventures, but content himself with the everyday details of common life." (Pref. p. 4.) "It is anticipated that the novel reader will reject the work as dull" (Pref. p. 5); "but," it is added, "to entertain that description of readers makes no part of my design." Now, if it was not the author's intention to attract the novel readers, why is the appearance and character of a novel so studiously given to the work? And it is only from the consciousness of this intention, that the work really has this appearance, that the author could suppose it was likely to fall into the hands of the novel reader, from whose criticism it had been secure, and by whose eyes it had not been profaned, had not its serious character been concealed under a mask. It is as if a drunkard were enticed into a house by a sign, with the usual inscription of "Good entertainment for man and horse," and, upon entering, should find himself in a Methodist meeting. The man, perhaps, had better be there than at the public house; but, according to our author, he ought not to have been kidnapped into serious company.

#### ADAM'S PEAK: CEYLON.

The following narrative of an excursion to the celebrated mountain called Adam's Peak, in Ceylon, will, we trust, be acceptable to our readers, as it contains some curious notices of the natives, and marks the improvements so surely and gradually taking place in the island.

—Ed. L. G.

I HAVE just returned from an excursion with his excellency, Sir Robert Wilmot Horton, to Adam's Peak, and, perhaps, a short account of our trip may not be uninteresting to you. We started on the 17th of February last, taking the new line of a road that has just been traced from Colombo to Ratnapoora, in the Saffragam district, a distance of about sixty-two miles.

As we did not leave until the afternoon of the 17th, and as it is in this country, as in most others, where there are no hotels to receive the weary traveller, any thing but advisable to go a-head of your servants, supplies, &c., we only got through about ten miles, to a place called Goddegamma, where a rest-house\* was erected, and most tastefully decorated to receive the king's representative. The country, so far, was not very interesting, being flat, with thick bamboo jungle on each side of the road. The modeliar (native nobleman) of the district (a government public servant), as well as the inferior chiefs, met us with a vast concourse of people. We dined and slept at this place, and the next morning, 18th of February, we were on horseback at gun-fire (5 o'clock), and got to Pittapane, eight miles, to breakfast: halted during the heat of the day, and in the afternoon proceeded on to Andapangodde (nine miles), at which we dined and slept; rest-house, or bungalow, decorated as the other was; the face of the country very much the same as that through which we passed yesterday. The inhabitants complained very much of the devastations committed on their lands by elephants. Next day, 19th, we were off at 4 A.M., as we had a tough ride for breakfast; the country changed from flat to hill, and we had to go over one or two rather steep passes. On the last pass we had a beautiful burst of mountain scenery, the Peak ris-

ing majestically in the centre, the distance to this place, Kurundenny, is about fifteen miles. We were here met by the adigar, a dignitary of the highest Kandyan order, similar, to a certain extent, to the head modeliar of the maritime provinces, but perfectly different in dress; a band of tom-toms and a series of flags and banners ushered our approach to the temporary rest-house erected for our reception. At 4, we were again en route, and reached Nakandelle (nine miles) at about 7, where we slept; the appearance of the country was much the same as the last stage. The next day (20th), we proceeded on to Korroowatte (ten miles), where there was a most beautifully situated bungalow, at which we breakfasted, and were met by the government agent of Saffragam district, and the medical officer who was stationed at Ratnapoora. We arrived at Ratnapoora, the chief town of the district, in the afternoon, and put up at the agent's house (an excellent roomy mansion), who entertained us in the most hospitable manner.

The town (with the fort) of Ratnapoora is very finely situated on an eminence; it is surrounded with rich paddy fields and splendid forests. We remained here the whole of the next day (21st), and his excellency took the opportunity, as he did at all stations where we halted, to summon the chiefs and head men, and to explain to them his hopes that they had their children vaccinated to prevent the fatal propagation of the dreadful small-pox; they promised, with hardly an exception, to do their "possible" to promote this desirable result. On the 22d, we left Ratnapoora at 6 A.M. for Gillemalle, about seven miles distant, through fine forests and some monstrous bad riding road; a very neat temporary bungalow was erected for us, the site very pretty. We breakfasted here, and started about 12 for the next stage. After a mile of level road, the ascent commences in real earnest. We left our horses at Gillemalle, as it was quite impossible to take them on with us. The governor was carried in a monshiel (a kind of palanquin), and I walked with the others—and a tough business it was. We reached Pallabattella about 5, having crossed the rocky bed of the Calu Gang (black river) three or four times in this day's route. Pallabattella lies at the foot of the great mountains surrounding the Peak.

The rest-house is a miserable place, but the chief priest had it "touched" up; and, having experienced a sharp shower above half a mile on the Ratnapoora side of the place, we were right glad to get under any kind of cover: added to which, the cold (thermometer stood at 60°, which to us, who had been exposed for months to a thermometer of from 80° to 86°, was really cold) gave us the appetites of hawks. The trappings of the Peak temple are kept in the charge of the priest. The next morning at day-break we were again in motion; the road appeared to be a series of water-courses—steep rocks and the roots of trees formed a kind of ladder over which we scrambled as well as we could: delighted were we to arrive at Diabette (five miles), which we achieved at about 10, ate a good breakfast, and then continued our pilgrimage on to the Peak, the road getting from bad to worse; it was, indeed, extraordinary how the bearers carried his excellency, who was, however, obliged to get out frequently. We now and then caught some beautiful views of the Peak towering above us, as well as some magnificent peeps at the low countries; up one of the steepest rocks there have been cut by some pious individual (whose

\* The property of government, for the use of travellers—there is one nearly every ten miles throughout all the roads of the island.

image appears carved out on stone) about 140 steps! these mountain stairs running perpendicularly up. About a mile from the peak (three miles from Diabette), we came to a small level green spot, called Andia Maletenne, or "the Fakir's Monument;" we took breath there, and then prosecuted our journey. We arrived at the foot of the great cone at about 2, and I confess its appearance was any thing but pleasant; the distance to the top is about 310 yards: to ascend to which you have literally to hang by chains; and at two or three corners we were suspended over rocks many hundred feet in height. Had one of us let go the chains, he would have been dashed to atoms. We surmounted all obstacles in about half an hour, and found, on the top of the peak, a small mud hovel (a portion of the temple), about 6 feet by 8. This was to be the abode of his excellency, and the other members of the party had to make themselves as comfortable as they could in two leaf huts, which had been erected for their accommodation. As evening drew on, we were enveloped in a thick mist; and, after sunset, the clouds rose above us, and formed, as it were, into mountains.

We found some pilgrims from the continent of India, on a visit to this, to them, sacred mountain. All our servants, of all religious persuasions (Buddhists, Protestants, Catholics, &c.), deposited sundry small coins, as offerings to the temple. A priest goes up to the peak, from Pallabattela, during the first four months of the year, when this devotional pilgrimage takes place of natives of Ceylon, as well as of the Musselmans and Hindoos of India.

The summit of Adam's Peak is about 75 feet by 25, and Budhon's foot\* is about 5 feet 3½ inches long, and 2 feet 5 inches wide. It is studded with a few gems, of little value, and a border of brass.

At 8 o'clock the thermometer stood at 58°, and cold enough we found it in our beds.

We drank Queen Adelaide's health, it was her birth-day, in champagne, like loyal people. We were all up at five A. M.; thermometer 55°. February 24th; this morning we had the pleasure to see the sun rise in all his majesty; but the most extraordinary feature of the scene, grand as it was, was the shadow of the peak, extending to the furthest horizon, and forming a perfectly mathematical cone, enough to puzzle a superstitious person: this decreased as the influence of the sun increased. The view, although we had not a "superfine" one, was grand in the extreme: the valleys of the chain of mountains over which we had travelled were enveloped in fog, and their heights appeared like so many beautiful islands. At 7, we let fly two pigeons, that had been brought from Colombo; after flying about the summit two or three times, they took the direction of Colombo; but, as I afterwards learned they never arrived there, it was inferred that hawks had made them their prey. I forgot to mention, that we had large fires during the night, and our coolies (porters), &c. bivouacked close to them: the poor creatures appeared to suffer extremely from cold. About ½ past 7 A. M., we committed ourselves to the chains, on our way down. These said chains have been attached to the most difficult rocks, from time to time, by devotees. We found the descent much more difficult than the ascent, and delighted we were to see Diabette, where breakfast was prepared for us. Near this place there is a famous echo, to which travellers are expected to listen. We got to Pallabattela to dinner, slept there, and the next day got down to Ratapora, after

\* Called the print of Adam's foot, in many stories.

a most delightful excursion, which no male resident on, or visitors of, Ceylon ought to miss, unless ill health, or other untoward events, preclude the attempt. As Sir R. W. Horton was the first English governor who had ever ascended the Peak, a brass plate is about to be affixed to the temple, on its top, commemorating the event.

Ceylon, April 1, 1837.

## ARTS AND SCIENCES.

### ZOOLOGICAL SOCIETY.

OCTOBER 24th. — Carlo Luciano Buonaparte, Prince di Musignano, read a paper on the habits of, and finished by describing, a beautiful species of *Trogon*, inhabiting Mexico. The species had previously been described by him in some American journal, under the name of *Trogon paradisæus*, and by Mr. Gould, in his work on the *Trogons*, under the specific name of *Resplendens*. Mr. Gray described a new species of sword-fish, from the Cape of Good Hope, belonging to the genus *Tretrapturus*, for which he proposed the specific name of *Herschellii*. Mr. Gray also exhibited some pieces of chalk, into which some molluscous animals, of the genus *Pholas*, had bored. An interesting discussion took place, as to the mode in which this animal made the hole in which it lived. Mr. Martin described a new species of bat, from Fernando Po, belonging to the genus *Bhinolophus*; the specific name of *Landerii* was proposed. A new species of hedgehog was also described by Mr. Martin: the name proposed was *Erinaceus comcolor*. Mr. Waterhouse exhibited to the meeting two specimens of kangaroo. One of these was procured in the neighbourhood of Hunter's River (New South Wales); the other had died in the Society's menagerie: from what part of Australia it had been imported, was not known. This latter animal, and several others like it, had always been considered as the *Macropus ualabatus* of Lesson. The specimen from Hunter's River, however, agreed perfectly with the description of that species, whereas the other differed in having the under parts gray instead of yellow; the ears longer, the sides of the face in the region of the eye rusty; in having the tail almost totally gray, and with short and pressed hairs, and in several other particulars. As Mr. Waterhouse thought this would eventually prove a distinct species, he proposed for it the specific name of *Bennettii*. A gray mouse, with bristly hairs, from the Cape of Good Hope, was also described by Mr. Waterhouse; for this he proposed the name of *Mus subspinosus*. Mr. Gould exhibited to the meeting several birds, among which he pointed out two new species of spoon-bill (*Platalea*), both from Australia: for one he proposed the specific name of *Regia*, and for the other, that of *Flavipes*. Mr. Gould also described a new species of ibis, from New South Wales, under the name of *Ibis strictipennis*. This species is allied to the sacred ibis of Egypt (*Ibis religiosa*). The characters of a new goatsucker were also pointed out, and the name proposed for it was *Amblypterus nyctidromus*. Some birds from New Zealand were exhibited, there being present at the meeting a New Zealand chief, who had furnished the Society with some interesting facts relating to their habits, &c. Among these birds, was the apteryx, an extraordinary wingless bird, with feathers like those of the emu, and with a beak somewhat resembling that of a snipe. Relating to the habits of this bird, Mr. Yarrell informed the meeting he had learned from the New Zealand chief that it made large

burrows in the ground, into which it retreated when hunted by dogs (the usual mode adopted for catching it); the nest is constructed with fern; the young are quite bare; and it seeks its food by night. Other interesting particulars were also related regarding the habits of some of the New Zealand birds. Adjourned to November 14th.

## FINE ARTS.

### NEW PUBLICATIONS.

#### Finden's Tableaux. Tilt.

A DOZEN graphic impersonations of as many different countries. If our recollection does not fail us, they are scarcely equal to their predecessors of last year. Some of them are very beautiful, nevertheless: for instance, — "Sicily" (the frontispiece), a female group, in fervent adoration of an image of the virgin: engraved by W. Finden, from a drawing by T. Uwins, A.R.A. "Castile," a lovely creature leaning and watching from a balcony, at night, engraved by E. Finden, from a drawing by W. Perring. "Georgia," an unnatural mother driving a bargain with a purveyor for the sultan's harem, for two graceful and timid girls, who are seeking protection in each other's arms: engraved by H. Egleton, from a drawing by T. Uwins, A.R.A. "England." Alas! when England was "merry England;" and not as she is now that fanaticism and avarice united have forbidden all the sports and games for which she was formerly so celebrated, and have rendered her people the dullest human beings on the face of the earth: engraved by E. Finden, from a drawing by F. P. Stephanoff. "Florence," a delightful tale of love — delightful, at least, to the teller: engraved by C. E. Wagstaff, from a drawing by F. P. Stephanoff. "India:" Hindoo maidens, who

" — Each within a little boat  
A little flame hath lit;"

and hath set it afloat on the Ganges, to ascertain the fate of her affections: engraved by H. Egleton, from a drawing by J. Brown. "Venice," a gallant handing his innamorata into a gondola, for an excursion on the Adriatic: engraved by W. Holl, from a drawing by F. P. Stephanoff. "Audalusia:" the termination of a bull-fight; mules dragging away the slain animal. In the foreground, a would-be matadore, of four years old, delighting his mamma and aunt by his ardent and enthusiastic expression and gestures: engraved by W. Holl, from a drawing by J. Brown, &c. &c.

#### Illustration of the Oriental Annual, for 1838. Tilt.

THE pleasure with which we have looked through these beautiful Illustrations has been sadly damped by the melancholy reflection that the hand which produced them is now cold in death. It is not probable that an artist will speedily reappear, who, in addition to great professional taste and skill, shall possess the intimate knowledge of eastern scenery and manners, which manifested itself even in the slightest sketch that proceeded from the pencil of the late Mr. Daniell. Numerous as are the subjects of that kind which were treated by him through a long and indefatigable life, the present series shews that neither his portfolio nor his memory was exhausted; but that he still retained the means of furnishing the highest gratification to the admirers of Asiatic landscape or architecture, character, and costume. Among the most striking specimens are, "Hindoo Female at the Tomb of her Child" (most appropriately selected as a frontispiece); "The

Mausoleum of Nizamondeen Pulea, Delhi; "Baalee, at Allahabad;" "The Rope Bridge, at Sirinagur," "Elephants fighting, Lucnow," (literally a devil of a dust); "Futtypore Sucri, near Agra;" "Deserted Houses of Palam Chiefs, at Old Delhi;" "Minar, at Futtypore;" "Mausoleum of Hamaicon, at Delhi;" "Castle of Ponaka, in Bontan;" "Fortress of Chunar, on the Ganges;" "A Female Peasant of Ceylon," &c. &c.

*Smugglers Attacked.* Painted by H. P. Parker; drawn on stone by T. Fairland.

A SPIRITED group. But again we must remonstrate against the stale trick of projecting parts of the figure, and their shadows over the boundary line of the frame.

### ORIGINAL POETRY.

#### TRAFALGAR.\*

BRITAIN'S Queen! Victoria, hail!  
List! I tell no idle tale;  
Short and simple is my story,  
Nelson's grave, and England's glory!  
Shall this proud, eventful day,  
Still unnoticed pass away!  
And no medal, badge, or star,  
Mark the fight of Trafalgar?  
Hearts and blades of metal true,  
Won the field of Waterloo—  
All who fought, with honest glow,  
Can the well-earned medal shew.  
On the wild, embattled waves,  
Death the gallant seaman braves!  
Hark! the rolling main afar,  
Shouts, "Remember Trafalgar!"  
Come, ye tritons, from the deep;  
Wake, dead warriors, from your sleep;  
Nelson's spirit bids ye claim  
Honours due to England's fame.  
Where would be her power and pride,  
Did her ships not rule the tide?  
Grant the brave, O royal star,  
Medals meet for Trafalgar!

### SKETCHES.

#### MEETING OF THE BRITISH ASSOCIATION.†

MR. EDITOR,—I am greatly surprised that, in all the published reports of the late meeting of this learned body, at Liverpool, many very important papers are left unnoticed. I had the pleasure of being present, but *incog.*, and made notes of all the proceedings; and if you can find space for the following supplement to the report which you have published, you will only do your duty to the intelligent public by inserting it.—I remain yours, &c.

JAMES H. FENNELL.

*Section A.*—Professor Aquarius, of Geneva, read a most interesting paper, in which, after having observed that astronomers had long been in *darkness* as to the nature of the *luminous* celestial bodies, vulgarly called stars, comets, &c., he stated that he had accidentally made the important discovery, that they are merely the reflections of the various waters of our own globe. A short time ago, he made two ponds in his garden, and, on the ensuing night, he discovered, from his observatory, two

stars which were perfectly new to him and all other astronomers. The following day two more ponds were made near to the others; and that evening two more stars were visible close to those observed on the previous night. He then, for experiment sake, made a pond upon the top of a high mound, and, having formed a trench to connect it with one of the lower ponds, he broke down the bank of the raised pond, so as to permit the water it contained to run rapidly into the other. He now looked up, and observed the reflection or star produced by the raised pond running with rapidity towards the reflection of the other pond, thus producing the common phenomenon of a meteor or shooting star. The author concluded by observing that this discovery proves that the stars are not inhabited, and that, as he has no doubt that the sun is only the reflection of the Red Sea, and the moon of the Sea of Azoff, he thinks we may conclude them to be equally tenantless. The learned professor sat down amid most deafening applause, which lasted for two hours and a half.

Professor Frost read a valuable paper 'On Icebergs,' and described many of enormous size. He thought that, if a tunnel were bored through them, the North Pole might be reached very easily. Mr. Snow Harris and Mr. Hailstone said they highly approved of the suggestion, and hoped it would attract the attention of Mr. Brunel.

*Section B.*—Professor Faraday read a short paper, wherein he observed that he had every reason to suspect antimony to be an alkali, because it is *so dear* (soda). Dr. Davy then remarked that he himself thought that antimony-wine was made dearer (*Madeira*).

Professor Goldfuss then made some remarks upon gold-mines, and on the iron-y of Steele. Colonel Silvertop said he quite acquiesced in the observations of the talented professor.

Mr. Charlesworth stated that a great quantity of plum-pudding stone had been discovered in the counties of Kent and Essex. Mr. Chadwick said he rejoiced at the discovery, as it would afford another means of economising in the victualling department of the poor-houses. He would communicate the interesting fact to the commissioners.

*Section C.*—Professor Sedgwick exhibited some portions of an ancient barrel-organ which had become fossilised. These *organic remains* were, as he remarked, very curious.

Dr. Buckland exhibited a large slab of free-stone, on which were four distinct marks, which he considered to be the foot-marks of some extinct animal. Mr. Murchison said he thought they were only the *foot-marks of a table*. The two gentlemen then entered into a lengthy dispute, which terminated without either embracing the other's opinion.

*Section D.*—Mr. Golding Bird read a paper 'On the Perch, and on the Goldfinch.' It was exceedingly technical, as his writings generally are.

Professor Frost read a paper 'On the Skate and Bleak.' He was applauded by every *sole* present.

Mr. Swainson read a paper, proving that, as *Cuvier* is the French for a *cooper*, the illustrious naturalist of that name must have been a follower of the *ternary* (turnery) system. Several systematists said that this was not a fair and logical inference; but the author replied, that he never would abandon any notion after having had the trouble of forming it.

Mr. Bell read a paper, of much interest, on the *clapper-rail*. He concluded amid a *peel* of applause.

Mr. Neville Wood exhibited the very mouse which came from the mountain in labour. Both he and the mouse were looked at with much curiosity.

An eminent *fly-catcher*, whose name we could not catch, read a paper 'On the genus *Musci-capa*.'

Mr. Gould read a paper 'On Bird Stuffing.' He did not approve of stuffing them with *sage and onions*, a barbarous method recommended by Glass, Kitchiner, Ude, Meg Doda, and others.

Mr. Yarrell exhibited some very interesting specimens, among which, were a *Buphaga*, or *beef-eater*, caught in the Tower; an *adjutant* from Waterloo; a *moor-hen* from Tom Moore; a *frog* from Crofton Croker; a strange *calf* from Cowes; a large *swan* from the Signet Office; a *great seal* from the Lord Chancellor; a *fire-flare* from Swing; some voracious *sharks* from Lincoln's Inn; and the "cinque-spotted mole" of Imogen.

Mr. Newman read a paper 'On the Ichneumon,' and then exhibited a very large *blue-bottle* found in a wine-cellar. The Bishop of Ferns read a paper 'On the *Cryptogamia*,' and Mr. Doubleday made some observations respecting the *double dahlia*.

Mr. Jesse exhibited a new species of *jessamine*, which grows in the ground where it lives till it dies.

*Section E.*—Dr. Roget made some statements corroborative of the discovery of a modern French philosopher, that the soul is but two grains of phosphorous. He said he believed the Will-o'-the-wisp to be the soul disengaged from some human being.

Mr. Knapp read a paper 'On Sleep,' and referred to the experiments of Baron Dupotet, who sends people to sleep by means of animal magnetism. He said he had often observed sleep produced by reading of a dull book or a sermon.

*Section F.*—Colonel Sykes read some valuable memoranda respecting the statistics of the metropolis. Among other things, it appeared that there are in London, 75,000 persons who chew tobacco; 100,000 who take snuff; 200,000 who smoke pipes; 80,000 who smoke cigars; 700,000 who have pocket-handkerchiefs, and 900,000 who have nothing but fingers; 600,000 who have quiet wives; 900,500 who have cross wives; and 700,000 who have no wives at all. He promised to lay before them, at the next meeting, a statistical report of the respective numbers of venders of hot kidney-puddings, sheep's-heads, dog's-meat, and baked potatoes, in London.

Dr. Taylor read a paper 'On the Medical Statistics of London,' from which it appeared, that 25,000 persons (including infants) take castor oil regularly once a week; 400,000 occasionally; and 700,000 never; 200 take the medicines prescribed by their doctors, and 900,500 throw their physic "to the dogs."

*Section G.*—Mr. Herapath exhibited some models for steam watches and clocks. He said that the application of steam to watches and clocks is entirely his own invention, and one for which he hopes to obtain a patent.

Mr. Monk Mason read a paper 'On the use of the Balloon in extracting Teeth.' He said, that if a number of lines of pack-thread be attached to the car of the balloon by one end, and the other ends fastened round the teeth of as many persons, all their teeth might be very expertly and comfortably extracted from their gums, simultaneously, on the rising of the balloon. The gentleman sat down amid great applause.

\* Received too late for the anniversary last Saturday; but never out of time. We saw them on that morning crowning Westmacott's fine statue of Nelson with a laurel wreath at Birmingham; and thought, amid all our embellishments of London, there is no public memorial of gratitude to the immortal hero of the Nile and Trafalgar.—Ed.

† Having given our own report of the Liverpool proceedings, we are (notwithstanding Bos's preceding admirable *jeu d'esprit* in Bentley's last "Miscellany") well inclined to insert this good-humoured essay of a correspondent.

P.S. I have more to tell you about the meeting, but must let the matter stand over for a while.

### DRAMA.

THERE has been no novelty this week, unless we can call some transmutations novelties. At *Drury Lane*, Mr. Ternan (the husband of Miss Jarman) essayed his metropolitan spurs, on Wednesday, as *Shylock*; and, though not a striking, gave a fair and correct, representation of the Jew. The rest of the cast languished sadly; as, indeed, do the general casts of the pieces which have been got up, or rather got down, here to very thin houses. *Covent Garden*, besides the *Bridal*, finely acted, and other plays, in which Macready is an acknowledged host, has treated us with the *Poor Soldier*, and thus reminded us of pleasant times of the drama, in the most pleasant manner. The *Haymarket* continues the successful run of S. Knowles's modern antique comedy, the *Love Chase*, so excellently acted, so extravagant in its incidents, so admirable in its dialogue, so well contrived in its stage situations, and so delicate and poetical in its best female character—a charm in which the author is unsurpassed by any dramatist that ever wrote. Miss Vandenhoff is very praiseworthy in this part, *Lydia*; but the finest and highest powers might be taxed to delineate it to perfection. The *Adelphi*, with Power in *Rory O'More*, ably supported by Yates in *De Vellskein*, and efficiently by the rest of the *dramatis personæ*, continues to keep the Strand alive by the unceasing echoes of laughter from the theatre. The *Death Token*, from the *Surrey*, is but commonplace in its construction, and improbable in its catastrophe (for who would stick a dagger, the evidence of a murder, conspicuously in his girdle?); but the exquisite acting of Mrs. Yates redeems it, and nothing can surpass the pathos with which she moves from her half credulous and half apprehensive affectation of laughter at superstitious fears to the belief in the dread reality of the supernatural warning. At the *Olympic*, *Hugo Bambino* (the *quondam Court Jester* of the *Haymarket*) deserves our applause; though on the night we were there it seemed to lack spirit, though Farren was the hero, and played the character in the most finished style. *Vestris* is not at home in the simple plaintiff heroine; but we see it stated that she was obliged to perform it, or not perform the piece. The *Country Squire*, however, makes ample amends; where Mrs. Orger is *Temperance*, the housekeeper, than which nothing can be more perfect—not acting, but life itself, and so subdued and natural that we hardly know a parallel; and Mr. and Mrs. Keeley, as the frightened guitarist and Moorish maiden in the intermediate vaudeville, make out a capital night's entertainment. At the *St. James's*, a new piece (the only exception to our statement) was produced on Thursday—too late for our notice. Mrs. Honey and Mr. Cockerton, we hear, are carrying on the *Norton Falgate* with spirit; and Miss Desborough, from Richmond, the *Queen's*.

### VARIETIES.

*Weather Wisdom*.—Our last week is so fairly prophesied, that we give the next with some confidence. "The end of the month variable; tokens of storms. The 30th raw and cold. The 31st rainy. Cloudy and dark weather. Many changes about the 2d and 3d, with wind and sleet. Cold air on the 4th—a fall of snow."

*Ether Enantique* (Ænantic).—In the sitting

of the French Academy of Sciences, on the 9th, M. Aug. Laurent announced, that he had succeeded in preparing enantic (not, as in our original, enantio) ether artificially. Mr. Deleschamps, to whom we owe the discovery of this ether, obtained it from old wines; and it is now generally believed that it is to this product that wines owe their peculiar bouquets.

*Ninth of November*.—Mr. Murphy, to whose meteorological predictions we have often referred (and who has just published a *Weather Almanac*,\* on his own principles, for 1838, and to which we shall have frequent occasion to allude), has advertised all cockneyland of the gratifying intelligence that the approaching ninth of November is likely to be a fine day for the royal city festival, though the weather both before and after it is likely to be bad. *Soit comme il est désiré!*

*Almanacs*.—Mr. Tilt has, as usual, issued a profusion of very cheap almanacs, in every form: and we have to notice the *Miniature*, a tiny thing of two inches by one; the *Hat*, to fit the crown, and costing a penny, not likely to make the purchaser over head and ears in debt; the *Useful*, another fair pennyworth, suited for London; the *Paragon*, and the *National*, other varieties, with the usual Almanac references and information. There is also a *Sunday Guide*, for the ensuing year, at the same moderate rate.

*Gresham Professorship of Music*.—Mr. Edward Taylor has been the successful candidate, having eight votes, whilst Mr. Horsley had two, and Mr. Phillips one.

*Education in France*.—In the beginning of the present year there were in the department of the Seine, 37 infant schools, with 6715 scholars; 259 communal schools, 30,017 scholars, and 53 classes of adults, 8456 students: in all, 47,188. A normal school, at Versailles, endowed with 12 bursaries, to educate teachers for primary schools, is to be added to the list.

*Malibran*.—M. Beriot's monument to Malibran, in the cemetery at Laken, as designed by Geef, is described to be a rectangular chapel, surmounted by a cupola and cross. A single door is to admit the light of day to penetrate the interior. A fountain is also mentioned; and the vision of the spectator will only catch an indistinct and mysterious view of a pure marble statue of Malibran, as she appeared in the fifth act of "Norma," after she had cast off the royal mantle, and stood with a poetic expression of exaltation and grief in garments of white.

*Genuine and Important Scientific Intelligence*.

—The French journal, to which we have referred, gives the following among its scientific notices; our readers will perceive that it is translated from Boz's capital hoax:—"Le Professeur Queerspeck vient d'inventer un chemin de fer portatif: au moyen de cette invention, tout employé d'un ministère ou d'une administration pourrait se rendre à son bureau en faisant 65 miles à l'heure; il lui suffirait pour cela d'adapter le véhicule à ses pieds. On a demandé à l'inventeur s'il faudrait une surface plane pour appliquer ce système ingénieux; il a répondu que les voyageurs marcheraient par séries, attachés par le bras."

*Hummel*, the celebrated composer, is stated, in the German journals, to have died at Weimar on the 17th.

### LITERARY NOVELTIES.

A periodical work devoted to the Picturesque and Romantic Scenery of the Birmingham Railway, has been some time in preparation, illustrated by Engravings on Steel.

\* Whittaker and Co.

Mr. Britton's long-promised "History and Illustrations of Caslobury," we learn, is very nearly ready. In a folio volume, consisting of thirty-five engravings, representing interior and exterior views of the house, cottages, lodges, &c.; with historical and descriptive accounts. The plates, presented to the author by the Earl of Eglinton, are from drawings by Turner, Alexander, Edridge, Hunt, Pugin, &c.; and only a limited number of copies are to be printed.

### In the Press.

Rural Life in England, by William Howitt.—Seven Weeks in Belgium, Switzerland, Lombardy, Piedmont, Savoy, &c., by John Roby, Esq., author of "Traditions of Lancashire," &c. &c.—Trelawney of Trelawney; or, the Prophecy: a Legend of Cornwall, by Mrs. Bray.—Life of Edward, first Earl of Clarendon, by T. Lister, Esq., with Original Correspondence.—A History of Prices, with reference to the Causes of their principal Variations from 1792 to the present time, by Thomas Tooke, Esq.—Electricity: its Nature, Operation, and Importance in the Phenomena of the Universe, by Wm. Leitch, Esq., Secretary of the Electrical Society of London.—Letters from an Absent Godfather; or, a Compendium of Religious Instruction for Young Persons, by the Rev. J. F. Riddle, M.A. Curate of Harrow.—History of English Literature, critical, philosophical, and biographical, by J. D.Israeli, Esq.—Vol. II. of The New Botanist's Guide, by H. Watson, comprehending Scotland, and the adjacent Isles.—Athens and Sparta; their Private Manners and Public Institutions, by James Augustus St. John.—A Popular Law Dictionary, by T. E. Tomlins, Barrister-at-Law.—Essays on Natural History, by Charles Waterton, Esq.

### LIST OF NEW BOOKS.

Human Physiology, by Dr. Elliottson, Part II. containing the Animal Functions, 8vo. 14s.—The Gems of Beauty for 1838, being Illustrations of the Passions, from Designs by E. T. Parris, Esq. with fanciful Illustrations in Verse, by the Countess of Blessington, imperial 4to. 11. 11s. 6d.—The Student's Guide to a course of reading for obtaining University Honours, by a Graduate of Oxford, 12mo. 3s. 6d.—Examination Papers for the Use of Theological Students, &c. 12mo. 3s.—The Domestic Medical Pocket Book; or, Families' Vade Mecum, by W. H. Kitchie, 12mo. 10s. 6d.—Parker's improved Lunar Tables, royal 8vo. 4s.—A Letter addressed to the Right Honourable Lord John Russell, M.P. on the Asiatic Cholera, by J. Ayre, M.D. 8vo.—Camillus, a historical Play, in five acts, by G. Condy, Esq. 8vo. 2s. 6d.—The Flora of Jamaica, a Description of the Plants of that Island, by James Macdwyer, M.D. Vol. I. Rhamnusaceæ—Leguminosæ, 8vo. 14s.—A Medical-Legal Treatise on Homicide, by external Violence, &c., by Alexander Wilson, Esq. 8vo. 2s.—The Book of Trees, 18mo. 2s.—The Life, Voyages, and Discoveries of Christopher Columbus, 18mo. 2s. 6d.—Do. do. of Captain Cook, 18mo. 2s. 6d.—The Elements of Syriac Grammar, by the Rev. G. Phillips, 8vo. 10s.—Affection's Gift, 1838, 48mo. 2s. 6d.—Friendship's Keepsake, 1838, 48mo. 2s. 6d.—Chemistry as applied to the Fine Arts, by G. H. Bachhoffner, 8vo. 7s. 6d.—Cynocure, by the Editor of the Carcenet, 18mo. 5s.—Phantasmion, fcap. 8vo. 9s.—Anglo-Norman Poem, on the Conquest of Ireland, edited by Michel, fcap. 8vo. 10s. 6d.—Christ's Temptation in the Wilderness, by Krummacher, 18mo. 1s. 6d.—Present State of New Zealand, fcap. 8vo. 4s. 6d.—A Free and Explanatory Version of the Epistles, by the Rev. E. Barlee, fcap. 6s.—Conversations on Chronology, with a Preface, by E. Jesse, 18mo. 2s.—Scenes and Shadows of Days Departed, by the Rev. W. L. Bowles, fcap. 7s.—Robinson's Scripture Characters, by the Rev. P. Hall, 4 vols. 12mo. 11. 4s.—The Commodore and his Daughter, 3 vols. post 8vo. 27s.—G. Futvey's Literal Translation of the Pharmacopœia, 32mo. 2s.—Ditto, Selection of Latin Prescriptions, 32mo. 3s. 6d.—The Authors of England, royal 4to., elegantly bound. 11. 11s. 6d.; India proofs, 2s. 12s. 6d.—Poetical Works of Thomas Campbell, illustrated edition, 8vo. 20s.; proofs 30s.—Cowie's Questions to Crombie's Gymnasium, new edition, 12mo. 2s. 6d.—Logarithmic and Trigonometric Tables, 12mo. 12s.—Life of T. Chatterton, by J. Dix, fcap. 6s.—Rev. R. Watson's Works, Vol. XII. 8vo. 8s. 6d.—The Squire, by the Author of "The Heiress," &c. &c., 3 vols. post 8vo. 11. 11s. 6d.—Memoirs of Bishop Bathurst, by the Rev. H. Bathurst, 2 vols. 8vo. 21. 10s.—The Young Christian armed against Infidelity, by M. Seaman, 18mo. 2s. 6d.—Memoirs of a Snuggler, 12mo. 3s. 6d.—Dr. Patrick's Heart's Ease, 18mo. 3s. 6d.—The Bench and the Bar, by the Author of "Random Recollections of the Lords and Commons," &c. 2 vols. post 8vo. 21s.—Memoirs of the Late Hannah Kilham, by S. Beller, 12mo. 6s.

## FAMILIES AND BOOK SOCIETIES IN THE COUNTRY. MONTHLY SUPPLIES OF NEW BOOKS.

The Proprietors of the British and Foreign Library, Conduit Street, feeling the necessity of meeting the great and increasing demand for the perusal of New Publications, have devoted their attention to the subject, and have digested a plan for the constant and regular monthly supply in Town or Country, of all New Works, English or Foreign, as soon as published.

This new plan is founded on the German and Prussian mode of circulating new books, and the proprietors conducting an extensive publishing business, chiefly devoted to the productions of the most popular writers, in connexion with their Library, are prepared to furnish ample supplies in the various branches of Literature. Families resident in the same neighbourhood, may unite in a single Subscription. Terms and Monthly Lists of New Works are sent as a single letter, on application (post-paid) to Saunders and Otley, Publishers, Conduit Street, Hanover Square.

### ARCHITECTURE AND CIVIL ENGINEERING.

New and very important Works for the Civil Engineer and Architect.

London and Brighton Railway. Remarks on Captain Alderson's Report on the various Lines of Railway to Brighton. Price 1s.

Lieut.-Col. the Hon. Sir Edward Cust's Thoughts on the Expediency of a better System of Control and Supervision over Buildings erected at the Public Expense, and on the Subject of rebuilding the Houses of Parliament. Price 1s.

Mr. Hall's Address to the British Association, explanatory of the Injustice done to his Improvements on the Steam Engine by Dr. Lardner. Price 1s.

Mr. Simms' Treatise on the Principal Mathematical Drawing Instruments employed by the Engineer, Architect, and Surveyor. Plates, price 2s. 6d.

Mr. Simms' Section-Planography; a Description of Mr. Macneil's Method of Laying down Railway Sections and Plans, with Folding Plates, in 4to. 2s. 6d.

Wilkins' (Regius Professor) Prohusiones Architectonicæ; or, Essays on Subjects connected with Grecian and Roman Architecture. Part I. royal 4to. in boards, with fine Plates, price 12s. 6d.

Part II. (the concluding) will be published at the end of the year.

Vicat's Practical and Scientific Treatise on Calcareous Mortars and Cements, translated, with Notes and Experiments made by Captain Smith, of the Madras Engineers, F.R.S. 8vo. with Plates, price 10s. 6d.

Barlow on the Strength of Materials, and on Construction. 8vo. with Plates, price 16s.

Papers on Subjects connected with the Duties of the Corps of Royal Engineers. 4to. with Plates, price 15s.

Transactions of the Institution of Civil Engineers. Large 4to. with 28 Plates, price 30s. (A few Copies left.)

Richardson's very interesting Work on Elizabethan Architecture. 60 Plates, elegantly half-bound in morocco, price 36s.

In preparation, and very nearly ready, The most comprehensive and valuable Practical Work yet offered to the Civil Engineer and Student.

On the Public Works of Great Britain. In royal folio, 150 Plates, engraved in the best style on copper, by the most eminent Mechanical Engravers, on Railways, Tunnels, Viaducts, Oblique Arches, Railways, Bridges, Canals, Lock-gates, Docks, Wharfs, Iron Works, &c. &c.; with Descriptive Letter-press. ### WELCH ON RINGWORM.—Dedicated

by permission, to Sir Benjamin C. Brodie, Bart. "This work is illustrated by coloured plates, exhibiting the disease in its various stages; and, as it contains instructions for the prevention as well as the cure of the disease at all times, it is of great value amongst the rising generation. It will be found a valuable desideratum to mothers, and others having the care of children."—John Bull.

In 4to. Part IV. and last (containing the Insects), with 2 Engravings, 25s. plain, and 35s. coloured.

### FAUNA BOREALI-AMERICANA;

or, the Zoology of the Northern Parts of British America. By the Rev. WILLIAM ELPHINSTONE, M.A. F.R.S. &c. &c. London: Longman and Co.; Norwich: Fletcher.

On extra vellum paper, in one thick volume, 8vo., with 43 highly finished Engravings, on steel, from the Burins of the first-rate Engravers, after original Pictures and Drawings by the most eminent Artists, price 12s. 6d.

### THE BOOK of GEMS; 1838.

The Modern Poets and Artists of Great Britain.

Edited by W. S. Orr, Paternoster Row.

With Biographical Notices, and Plates of Autographs.

"As a whole the book is splendid."—*Athenæum*.

"It is altogether the most attractive book of the season, fully justifying its title. It is in truth a Book of Gems."—*Sunday Times*.

"The engravings are really admirable."—*Edinburgh Review*.

"The book is handsome, pleasing, and useful. It will give to most purchasers as much poetry as they desire of the modern and minor poets.... Its topographical character is of the highest excellence, and more than forty plates decorate its pages, very fairly representing the present state of the British school of painting."

"The selection of British poets and specimens of their poems is alike indicative of good taste and sound judgment."—*Naval and Military Gazette*.

"The biographical facts which are interspersed with the critical remarks are highly valuable, and are clearly and concisely given."—*Observer*.

Whittaker and Co. Ave Maria Lane.

In 1 vol. 8vo., with numerous illustrations, price 10s. 6d. boards.

### A PRACTICAL TREATISE ON WARMING BUILDINGS BY HOT WATER, and an Inquiry into the Laws of Radiant and Conducted Heat. To which are added, Remarks on Ventilation, and on the Various Methods of Distributing Artificial Heat, and their Effects on Animal and Vegetable Physiology.

In 9 vols 8vo., price 12s. 11s. 6d. cloth lettered.

### A RESIDENCE in GREECE and TURKEY;

with Notes of the Journey through Bulgaria, Servia, Hungary, and across the Balkan. Illustrated by numerous Coloured Lithographic Engravings, from Views of interesting localities, and with Portraits of illustrious Greeks and Turks, taken by the Author.

By FRANCIS HERVE, Esq.

Whittaker and Co. Ave Maria Lane.

Fcap. cloth, price 6s., with a portrait from a picture in the possession of G. W. Brackenridge, &c.

### THE LIFE of THOMAS CHATTERTON.

Including his unpublished Poems and Correspondence, by JOHN LEE.

"Your book, I should hope, is likely to excite considerable interest. It is a remarkable proof of how much may be done by diligent and zealous inquiry."—*Extract of a Letter from Dr. Southey to the Author*.

London: printed for Hamilton, Adams, and Co.

# FISHER'S DRAWING-ROOM SCRAP-BOOK, 1838.

Containing Thirty-six highly-finished Engravings, illustrated with Poems  
By L. E. L.  
"The author of this volume is Miss Landon: and a very wonderful work it is."—*Spectator*.  
"The volume contains some of the sweetest poetry Miss Landon has ever produced—besides a great number of beautiful engravings."—*United Service Gazette*.

Embellished with Sixteen Plates, engraved on Steel in the best manner, elegantly bound in Morocco, 15s.

## The Christian Keepsake, 1838.

Edited by the Rev. W. Ellis.  
This Annual is devoted to the advancement of Religion at home, and its extension abroad; and includes Original Contributions from distinguished Christian Writers, Travellers, and Missionaries, without reference to sect or party.  
"This Annual, in the solidity and permanent interest of its subjects, may almost claim the character of perennial, from the world to which it is addressed."—*Spectator*, Oct. 14.  
"This is a very beautiful and solidly attractive volume, both as respects its literature and illustrations. Among the latter, we notice the only portrait of Mrs. Fletcher ever published; it is an admirable likeness, and will be an object of great interest to her admirers."—*United Service Gazette*.

## THE ONLY JUVENILE ANNUAL FOR 1838.

### Fisher's Juvenile Scrap-Book, 1838.

By Agnes Strickland and Bernard Barton.  
Containing Sixteen Engravings, and forming an attractive and instructive volume for Family Presents and School Prizes.  
Price 6s.  
"The literary department of the volume has been prepared with the most careful attention to the great object of inculcating the precepts of virtue and religion, and of excluding from the pages of the Juvenile Scrap-Book every thing likely to produce a bias to levity, affectation, and false sentiment."—*Editor's Preface*.  
"This is the prettiest annual for the use of young people that we have seen, and the literary contents are of an unusually high character. 'The Captive Princess' is a charming poem."—*Literary Gazette*.

## Fisher's Oriental Keepsake, 1838.

Second Series of Thirty-seven Views in Syria, the Holy Land, Asia Minor, &c. From Original Drawings on the Spot, by W. H. Bartlett. With Descriptions by J. Carne, Esq. In English or French. 4to. handsomely bound, 51s.  
"To those who have fortune, leisure, and enterprise, what more seductive inducement could be offered than the scenes placed before us by the pencils of Bartlett, Puerse, and others, in the present volume? Who would not enjoy a seat in the court of the country-house near Damascus, or ramble among the ruins of Seleucia, or walk into the bazaar at Jaffa, or skim the bright waters under the 'pirate town' of Aiyah, or land in the beautiful harbour at Rhodes, or stand where Ibrahim Pasha encamped, or stroll among the pillars that yet remain of Sell, or search out one of the villages of Barouk on Mount Lebanon; nay, we had almost said, who would hesitate to take up his final rest in the Turkish burying-ground at Sidon?"—*Court Journal*, Oct. 7.

## Gage d'Amicitie, 1838.

The Midland Counties' Tourist, uniform with, and forming the 4th and last Volume of "The Northern Tourist" Series. Seventy-three Views of Castles, Cities, Towns, Scenery, &c. in the Counties of Cheshire, Derby, Leicester, Lincoln, Nottingham, and Rutland, with Original Drawings on the spot by Thomas Allom. With Descriptions in English or French. 4to. handsomely bound, 51s.

In 2 vols. 8vo. price 18s.

## The Life and Reign of William the Fourth.

By the Rev. G. N. Wright, M.A.  
Embellished with 11 highly finished Plates, principally Portraits of celebrated Naval Commanders, from the original Paintings in the Naval Gallery of Greenwich Hospital.  
"A very opportune and useful performance, collecting all the important events of the late reign, and enlivening them with a great collection of anecdotes."—*Literary Gazette*, Oct. 14.  
Fisher, Son, and Co. London and Paris.

Cheap Edition of *Jenks's Devotions*, improved by *Simson*.

## PRAYERS AND OFFICES OF DEVOTION FOR FAMILIES, and for particular Persons upon most occasions.

Published by Livingston, St. Paul's Churchyard, and Waterloo Place; and J. W. Parker, West Strand.

Of whom may be had, price 3s. In boards,  
A Latin Syntax, and First Reading Book for Beginners; being an adaptation of Broder's "Little Latin Grammar" to the Rhen Syntax.  
"This is the work of an excellent and thorough scholar, and one of the very best books yet published for its purpose."—*British Magazine*.

Mr. Holden's Exposition of the Bible.  
In 1 large vol. 12mo. price 12s. In boards, the 2d edition, revised and improved.

## THE CHRISTIAN EXPOSITOR; or, A Practical Guide to the Study of the New Testament.

Intended for the Use of general Readers.  
By the Rev. GEORGE HOLDEN, M.A.  
Though many Expositions of the Bible of great and deserved celebrity exist in our language, a Commentary sufficiently short to be read by those who have not leisure to consult learned works, yet sufficiently comprehensive to serve as a guide to the study of the Sacred Scriptures, appears to be still wanting. To supply this deficiency is the design of the present work, in which it has been the aim and study of the author to embrace, in a condensed form, such information as will enable the general reader to ascertain the real meaning of the inspired writers.  
Printed for J. G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

## The Christian Expositor of the Old Testament.

Of whom may be had, by the same Author,  
The Christian Expositor of the Old Testament. Price 12s. 6d.  
Price 3s. 6d. the 3d edition of  
LYRA APOSTOLICA.  
(From the British Magazine.)  
Livingston, St. Paul's Churchyard and Waterloo Place, Pall Mall.

## MEMORIALS OF A DEPARTED FRIEND.

"She being dead, yet speaketh."—*Hab.*  
Printed for J. G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

## THE LIFE of the Right Rev. Father in God, THOMAS WILSON, D.D. Lord Bishop of Sodor and Man.

By the Rev. HUGH DOWELL, Late Rector of Baltham, Isle of Man.  
Printed for J. G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

## A COMMENTARY on the ORDER for the BURIAL of the DEAD, considered as a Manual of Doctrine and Consolation to Christians.

By the Rev. WILLIAM GRESHWELL, M.A. Fellow of Balliol College, Oxford; and Curate of Disley, Cheshire.  
Printed for J. G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

## TWENTY-SIX VILLAGE SERMONS.

By the Rev. EDWARD BERENS, M.A. Archdeacon of Berks.  
Printed for J. G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

## Girdlestone's Commentary on the Bible.

In 8vo. price 9s. the Second Part, containing Leviticus, Numbers, and Deuteronomy, of  
THE OLD TESTAMENT, with a Commentary, consisting of Short Lectures for the daily Use of Families.

By the Rev. CHARLES GIRDLESTONE, M.A. Vicar of Hedgley, Staffordshire.  
In this edition of the Bible, it has been one chief object to supply families with an exposition for daily reading. The Scripture is divided into paragraphs of convenient length, and the explanatory and practical matter is digested, under each portion, into one continuous lecture, so as to require no previous examination on the part of those who read it to their families. At the same time, it is hoped that the annotations which have been taken to explain all obvious difficulties, and to derive from each passage its appropriate lesson, whether of doctrine or of duty, will render the work no less useful to those who study the Word of God in private.  
Printed for J. G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

## The First Part, containing Genesis and Exodus, price 9s.; or the Two Parts in One Vol. 18s.

## The New Testament, with a Commentary.

In 2 vols. 8vo. price 11. 10s.; or in Four Parts, at 9s. each.

## CONNECTION of SACRED and PROFANE HISTORY, from the Death of Joshua to the Decline of the Kingdoms of Israel and Judah. Intended to complete the Series of Shuckford and Prideaux.

By the Rev. MICHAEL RUSSELL, LL.D. Author of "The History of the Church in Scotland."  
"By the appearance of this work, the length supplied with a 'Connection of Sacred and Profane History,' from the creation of the world down to the era of the Christian Redemption; in which are set forth, not only the most remarkable events which befell the ancient people of God, but also an account of the origin, constitution, learning, commerce, and polity, of all the distinguished nations of antiquity.  
Printed for J. G., and F. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

Of whom may be had, by the same Author,  
This work may be had now complete, in 3 vols. 8vo. price 31. 2s. boards.

In 8vo. 16s.

## ARISTOTELIS ETHICA NICHOMACHEA, ex recensione Imm. Bekkeri. With English Notes, a running Analysis of the Arguments and separate Introduction to each of the Ten Books.

MR. BENTLEY HAS THIS DAY PUBLISHED  
THE FOLLOWING NEW WORKS:—

**CHELSEA COLLEGE AND ITS TRADITIONS.**

By the Rev. G. R. GLEIG, Author of "The Subaltern," "The Country Curate," &c. 3 vols.

II.

**THE SQUIRE; A NOVEL.**

By the Author of "The Merchant's Daughter," "The Heiress," &c. 3 vols.

III.

MRS. TROLLOPE'S NEW NOVEL.  
**THE VICAR OF WREXHILL.**

With numerous Illustrations by Hervieu. 3 vols.

IV.

**THE OLD COMMODORE.**

Also, by the same Author,

Third edition, in 3 vols. "RATTLIN THE REEFER."

Edited by CAPTAIN MARRYAT, R.N. Author of "Peter Simple."

V.

**NARRATIVE OF THE LAST EXPEDITION INTO THE  
INTERIOR OF AFRICA.**

INCLUDING A STEAM VOYAGE UP THE NIGER.

By MACGREGOR LAIRD AND R. A. K. OLDFIELD,

Surviving Officers of the Expedition. 2 vols. 8vo. with Map and numerous Plates.

"At length we have a book of real travels, embracing scenes of danger, privation, hardship, death; full of novelty, variety, character; and not less remarkable for the spirited determination with which the enterprise was carried through, than for the information gained as to the social and political condition of Central Africa, and the commercial speculations which that information suggests. \* \* Independent of the picture of negro manners, life, and character, presented by the general narrative, we have, in Mr. Laird's portion of the work, the remarks of by far the shrewdest and most informed mind that has yet surveyed the interior of Africa."—*Spectator*.

VI.

**THE BIVOUAC; or, Stories of the Peninsular War.**

By W. H. MAXWELL, Esq.

Author of "Stories of Waterloo," "My Life," &c. 3 vols.

"The stirring and touching scenes in this work, as well as the interesting episodes it contains, will cause it to be perused with constant interest."—*Literary Gazette*.

VII.

**THE LETTERS AND WORKS OF  
LADY MARY WORTLEY MONTAGU.**

Edited by LORD WHARNCLIFFE.

The 2d edition, revised, with Additions, in 3 vols. 8vo. with numerous fine Portraits.

"Three very handsome volumes, full of the acuteness which invariably marks a clever woman's observations on human nature; full of smartness, oddity, and wisdom; full of intensity, spirit, and beauty; and certainly composing no trifling addition to that department of literature—the 'gay memoir.' The Letters exhibit an extraordinary instance of the thoughts and language being honestly coloured by circumstance, and forming a sort of diorama of the mind and heart, passing before the eyes of the admiring reader in Stanfield house. The work comes forth under the fostering care of Lord Wharncliffe—Lady Mary's great-grandson—who has been enabled to add many original letters, and introduce the whole by some pleasant biographical anecdotes."—*Athenaeum*.

VIII.

**MR. IRVING'S NEW ROMANCE,  
THE HUNTERS OF THE PRAIRIE;**

Or, THE HAWK CHIEF. 2 vols. price 12s.

"A narrative of daring and chivalrous adventure, abounding in attractive and vivid descriptions, and presenting sketches of character worthy of a master."—*Sunday Times*.

**THE NEW VOLUME OF "THE STANDARD NOVELS."**

On the 31st instant, with the Magazines, complete in 1 vol. neatly bound, and embellished with Two Engravings by Greathach, price 6s.

**MR. AINSWORTH'S "ROOKWOOD."**

Forming the New Volume of THE STANDARD NOVELS AND ROMANCES.

**THIERS'S HISTORY OF THE FRENCH REVOLUTION, IN WEEKLY ONE SHILLING PARTS.**

Now in course of publication, embellished with Forty exquisite Engravings of the most Distinguished Characters, and Views of all the Great Events which occurred during that memorable Epoch,

**THE HISTORY OF THE FRENCH REVOLUTION.**

By M. A. THIERS, late PRIME MINISTER OF FRANCE.

With Illustrative Anecdotes and Notes, now first added, by FREDERICK SHOBERL, Esq.

\* NUMBERS I. II. III. AND IV. ARE NOW READY.

\* \* The above Work will also be published in Monthly Parts, price 5s. each. Part 1. will appear with the Magazines, at the end of November.

**RICHARD BENTLEY, NEW BURLINGTON STREET,  
PUBLISHER IN ORDINARY TO HER MAJESTY.**

Printed by JAMES MOYER, of Brook Green, Hammersmith, in the County of Middlesex, Printer, at his Printing Office, Number 28 Castle Street, Leicester Square, in the said County: and published by WILLIAM ARMIGER SCRIPPS, of Number 13 South Molton Street, in the Parish of Saint George, Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Waterloo Bridge, Strand, in the said County, on Saturday, October 28th, 1837.

### REVIEW OF NEW BOOKS.

*The Lady Annabetta: a Novel.* By the Authoress of "Constance," "Rosabel," &c. 3 vols. 12mo. London, 1837. Saunders and Otley.

Mrs. THOMSON has here produced a very delightful work, whose peculiar excellence is being essentially a woman's book—one that only a woman could have written. What are the characteristics of a woman's mind when of the highest order? Truth, grace, and feeling. Such are the characteristics, also, of the volumes now before us. An interesting story is made subservient to the development of character; and, if we may use the expression, lighted up by the most playful wit, passing from "gay to grave, from lively to severe." The character of Florence, the heroine, is an exquisite picture, or rather succession of pictures. At first there is the beautiful and clever, but spoiled girl, involved in a love affair—so called by courtesy—partly from idle romance, partly from that spirit of opposition which is sure to spring up where there has been no proper authority. There are, however, the materials of good; and the way in which they are worked up, so as to produce a good result, is admirably done. The principles are awakened and strengthened by affection and affliction—those feminine touchstones; and the whole is left like a highly and delicately finished statue.

The sketch of Lady Annabetta herself is the most powerful thing Mrs. Thomson has yet done. The fever of jealousy, fretting the mind till the mind itself gives way, is fearfully distinct and the closing scenes of her husband's death-bed, and those attendant upon it, are drawn with a terrible reality. But we must "open the leaves and look within," or rather let our readers look, endeavouring not to break in upon the narrative, but to give an idea of the style and sentiment.

*A Fancy Fair in a Country Town.*—"Feuds were at this moment rife in the small town of Chatfield. No Guelphs, nor Ghibellines, were ever more determined foes than the respective adherents of Mrs. Simcox and Mrs. Taggart had of late become. Various and intricate causes had unhappily, as it was the proper thing to say, wrought up these two ladies to the point of direct hostility. Mrs. Simcox wanted to manage the book society all in her own way. Mrs. Taggart was too eager and vehement in assuming and carrying on the business of a charitable society, the lady members of which had undertaken to make and sell various ornamental and useful articles for the benefit of the poor generally; a sort of ancestral proceeding to that species of charitable chivalry denominated, in our modern days, a fancy fair, or bazaar,—more modern undertakings, which were just beginning at this time to come into vogue, but were not patronised at present with that intense enthusiasm with which they have since been carried on and encouraged. The ladies of Chatfield, who humbly called themselves the Dorcas Society, and who had hitherto been contented with meeting monthly to cut out calico bed-gowns, and prick their fingers to pieces with

hemming linsey woolsey aprons, stimulated now by Mrs. Simcox's more elegant suggestion of fabricating fancy articles (she being nothing of a sewer herself), those highly meritorious ladies, the manager and secretary of the Dorcas Society, seconded by the members, had set out with Christian charity as their object, publicity and commendation as their aversion; nothing could be more objectionable than the notice that would be attracted to them, *et cetera, et cetera.* They met in committee, and quarrelled every time. The objects intended to benefit by the bazaar were, a benevolent society and county ophthalmic infirmary. Mrs. Simcox took the chair. At the very first onset, Mrs. Taggart walked out of the room. She was brought back by the united entreaties of her friends, but matters had not been satisfactorily composed. 'It was very distressing' to all the ladies, according to their own account, to be constrained to take one side or another. First, they were obliged to differ, and, that necessary preliminary being arranged, Mrs. Simcox and her set formed themselves into a committee in the tea-room, and Mrs. Taggart in the card-room, at the White Hart; a long, windy, blue-panelled apartment, occasionally divided by rickety folding doors, in which every meeting was held, from the bench of magistrates down to 'Mathews at Home,' where a ball one night was succeeded by Walker's orrery the next;—wax candles one evening, and fumes of tobacco the next morning. The belligerent parties being separated, the cause of benevolence began to flourish. Now and then, indeed, a scout from Mrs. Simcox's body-guard would intrude upon the dignified coterie of Mrs. Taggart; and occasionally, under the pretext of wanting ink, or borrowing paper, a confidential aide-de-camp of Mrs. Taggart was seen curteying in the opposite doorway to Mrs. Simcox, sure to be greeted when she came back with—'Well, Lizzy,' or 'Sophy, as it might chance, 'how are they getting on? Have they much to shew?' To do Mrs. Taggart justice, the prospects of her division were far more precise than those of her philosophic rival. Mrs. Simcox harangued better than she worked; and all she contributed to the stock of saleable things consisted in her own impromptus, scribbled in her own bad hand, upon note paper, and sealed—to be feloniously vendored for two shillings each. 'Well, if this is not picking pockets!' was Mrs. Taggart's exclamation, when news of these performances reached her hostile camp;—'but, to be sure, it is all for charity.'"

*Beautiful Miniature.*—"Florence was indeed a being upon whom a wiser and a better father than Major De Grey might look with pride. Her immature beauty had in it a rare and fascinating peculiarity; her hair—of a pale brown, not flaxen, nor yet chestnut, of that soft and rare tint which enhances the brilliancy of the complexion, while it scarcely casts a shadow upon the cheek—hung in ringlets, so loose that they almost might be called tresses, even to the boddice of her gown. The beauty of Florence de Grey, its quality and degree, was often, however, the source of dispute to common observers. The long, shrewd, and penetrating, yet soft and tender eye, half

hazel, half gray, required to be lighted up by certain feelings before its surpassing power and uncommon depth of expression could be estimated. The eye-brow was long and pencilled, but not dark, even though contrasted with a forehead, white, and clear, and high, such as may chiefly be traced in English beauties of the upper classes. But, if in the eye, that speaking feature, even the most partial observer might allow a somewhat of fire, or even severity, to be at times too obvious, the loveliness, and freshness, and innocence, of the mouth and lower part of the face, retrieved the defects of a transient, though frequent, expression, at this period of Miss De Grey's youth, almost too strong and flashing. There was such a play on those youthful lips; such sweetness, yet such sarcasm; such merriment, yet such sensibility, that real judges of beauty—that is to say, good judges of other things, persons of cultivated taste, refinement, and sense; for, without these requisites I would give little for the estimate which people pretend to make of beauty—such persons were uniformly led away, as the saying is, by Florence de Grey's face, or, rather, by Florence de Grey, with a different face, a different countenance, every five minutes; for evanescent were the smile and the gloom which succeeded each other on that beaming face. But how idle is description! for, whilst the impression which some countenances make upon the heart and imagination is indelible, language refuses its aid to the 'thoughts that breathe.'"

*Differing Delights of a Watering-Place.*—"One day at a watering-place is not only the mournful predecessor, but the monotonous prototype of another. First, the aristocratic visitant is quickly installed into the over-grown hotel; rooms chosen, ladies' maids and poodles are accommodated, imperials unpacked; the ladies dress, and look out of the window upon the long, new street, studded with flies—by courtesy so called—and donkey carriages; a solitary beau or two may be seen wending his way from the billiard-room, or, by signal good fortune, you may be cheered by the aspect of an arrival. Then a costly, but by no means sumptuous dinner is served up—beef-tea soup, venerable fish, and that legitimate loin, or half-loin, of mutton, indigenous in all watering-places. After dinner, how cheerful! The gentleman falls asleep, mamma nods, and the poor young lady is left to pass the long evenings the best way she can; generally languidly enough, without the solace of home interests, and with nothing but worsted work to console her. Such was, at least, the fate of Florence de Grey. Far happier are the merry citizens of some solid borough, who turn out for a week's holiday, bring neither servants nor carriage, are under no dominion of the phantom gentility, nor enslaved by domestics, leave their horses at home, pay, and sit down, with good appetites, unconscious of the chance of degradation, to the crowded public table. 'For I declare,' as remarked Mrs. Bird, who, with a flight of Birds, had alighted at Burkenhead, from Sheffield, 'one might as well be in one's own parlour with Mr. Bird, as live in one's own room.' Then, at the 'Family Hotel,' all different

members of the family are accommodated with society to their taste. Mr. Bird meets with a friend, with whom he has done business at York some ten years ago; is very glad to renew the acquaintance; half talks him into a bargain before coffee is announced. For a friend, in Mr. Bird's mind, is a ledger embodied—his moral qualities all centre in his credit. Then the Miss Birds—who come to Burkenhead with great expectations, and are at first disappointed, can at first see nothing that comes up exactly to their ideas, either in the natural or physical world—find, after a few dinners and a little music in the evening, that they made too precipitate a judgment—they attract and are attracted—the eye and fancy are caught—and they go home at the week's end, having passed the happiest week in their lives; whilst their amiable mamma has returned with a fresh and consolatory conviction of the extreme delicacy of her own health, and the interest with which her case has inspired Mrs. Thomson of Hull, Mrs. Green of Halifax, and various other matronly ladies, arrived at that age when every thing but dress and medicine has ceased to afford them much interest. For woman, it seems, must take up some folly to console her in her passage through life; and perhaps I should say that, in uncultivated minds, and with unemployed hands—though with neither of these conditions in our sex can the present day be reproached—that to such, the least useful, most fretful, and most egotistical period of existence, is that when, having performed all that Providence has allotted to her in the way of having and rearing children, she steps into confirmed middle age—has less to do than she ever before had in her life—nothing progressive in her own immediate prospects—finds that her children can do very well without her; and feels that the days of romance are over with the worthy gentleman, her husband."

*Description of a Statue.*—"It was that of a girl of eighteen or nineteen, softly and negligently fallen into a slumber, her arms folded underneath her face, which, in an attitude incidental to youth, rested upon them,—a beautiful exemplification that in the spring of life our sleep is easy, and requires not the appliances and means to boot, which the pillowed head of a more troublous period of life renders essential. The figure now alluded to, seemed, in truth, to press, as of one actually in deep, though soft repose, the mattress on which it lay extended, the air and sentiment of repose pervading every limb, and every muscle characterising even the loose and light folds of the clinging raiment, and resting upon the placid features of the youthful face, which certainly resembled that of Florence. There was an indefinable languor, not of disease, but of slumbrous inanition, perfectly distinct from death, upon the brow, the mouth, the rounded and placid limbs; and yet so perfect was the illusion, that a vague impression was imparted to the observer, that the sleeper might instantly awake, or be aroused to consciousness and activity; so serene, yet so breathing, it seemed; so delicate, yet so full of vigour; in short, so human was it,—not

'So coldly sweet, so deadly fair,  
We start! for life is wanting there;'

for art had done her utmost, and the inspirations of genius had almost vivified the cold marble."

*The Death-beds of a Workhouse.*—"There were seven or eight beds only in this ward; and the flower of the infirmary's unhappy tenantry, the youthful and the hopeful, those

who loved life, and who were not admonished by loss of limb,—or obstruction of muscular strength,—or benighted reason, to give it up without reluctance, were here laid; reason in most instances fully spared to them,—spared to aggravate the bitterness of separation from their humble homes, their consignment to strange nurses, and, worst of all, spared to them to see hourly some neighbour in misfortune carried off to that resting-place where each in her turn expected to be carried next. On one bed lay a mother just entered into the infirmary, who had left her children; they were ill of the whooping-cough, and their father was out at work all day: she was crying bitterly, fearful that they would be neglected, and in particular that little Johnny, the youngest, would not be happy with the strange girl, hired at a shilling a week, whom she had left to nurse him. Next to her, was a young married woman, far advanced in consumption; brought on by cold after her first confinement. Her case was hopeless, but not one of immediate danger, and time was allowed her to prepare for the last change. To the question, tearfully asked by Miss De Grey, whether she was resigned to the idea of an early death? she answered simply, 'that she should be, but she had not been married above a year, and she had a kind husband, and a young infant, whom she was loath to leave,' and a flood of tears brought on a fit of coughing, so fearful, that the frame of the poor young woman was shaken, as a stem of a frail birchen or larch-tree is shaken by the wind; and Florence moved on until the dire paroxysm was past. The unfortunate occupant of the next bed was still younger than any of the former objects of heartfelt compassion. She had been a dress-maker; and the neat night-cap, under which appeared the plaited hair, tied on either side of her face with a scrap of pink riband, shewed a former attention to the vanities—perhaps the sinful vanities, of life. This patient was in the last agonies; with her the combat was almost over; she was breathing her last, in hard gaspings; her blue eyes fixed, but her mind still conscious—her fair hand, garnished with rings, lay upon the coarse sheets; no one knew anything about her, except her age, nineteen: no friends had been to see her, nor distant relatives sent her any token of kindness. Her previous life, her, perhaps, lonely sufferings, first hard work, then sickness, then want, might be conjectured, but they were not ascertained. She was far gone when she came in; the clergyman had not been with her—he was expected in a quarter of an hour—'but then'—the nurse said, looking at the poor girl, 'her pains will be over.'"

These extracts will shew the great variety of talent displayed in this work—there is that lively wit, which is so successful in making the real stand vividly before us; and there is a deep feeling, subdued by high principle; together with the power of making both effective in the story. The *Lady Annabella* is a work that must greatly add to Mrs. Thomson's already high reputation.

*Wallace; a Historical Tragedy, in Five Acts.*  
8vo. pp. 173. London, 1837. Longman and Co.

THERE are but few subjects in Scottish history better adapted for dramatic representation than the daring exploits of Wallace, and the rude but chivalric characters to whom he was opposed. His life resembles the remembrance of an appalling and splendid dream, in which all that is golden and glorious is tarnished and

bedabbled with blood; like the last sunset which gilded the vanes of Herculaneum, there is something ominous in its decline. He seemed, from the outset, to stand like Samson, grasping the pillars of the temple, and prepared for the death that impended in the avalanche of his own slaughterers. Like Crichton, he shot across the sky, sudden and startling as a meteor; and scarcely had man time to point out the terrible track which he had traversed before he was gone.

No marvel, then, that a young mind should, eighteen years ago, and in the short space of six days, while attempting to grapple with, and portray such a character as Wallace (in the onward burst of enthusiasm, and all the flush and excitement created in the youthful boom while contemplating such a hero), commit many faults in composition, which practice, and the judgment of maturer years, would avoid. One advantage is, however, gained by such faults: the composition oftener retains all that fire and stirring energy which are wanting in the coldly correct and more finished production. The present tragedy contains many passages that would bear out our assertion: intermixed, it is true, with dross and rough matter, but which, when carefully examined, will be found to produce sterling and golden poetry. Take the following burst:—

"The storm increases. Hark!  
That awful peal might daunt the bravest spirit,  
And sober even madness."

The two following lines are also very graphic and original:—

"When war knocks at the gate, nor waits our coming,  
But bursts the lock, and rudely rushes in."

Here, again, is a picture:—

"Oh, 'twas a moving scene  
To see each hill and village on its brow  
Smile in the beauteous splendour of the sun—  
As young and old, the matron and the maid,  
The lame, bedridden, and the hisping babe,  
With anxious eyes knooked to the field of war!  
While blessing and fond hope, together blending  
In patriot tears, stole silently along  
Their trembling cheeks."

Although there are many passages scattered over these pages containing great strength and beauty, yet, if extracted, they would scarcely convey a notion of the power and harmony which run through and link the scenes together.

The plot is well sustained. The scene where the traitor Lundie offers to lead the English commanders by a safe path to the Scottish camp is admirably given. The fair Florenna is a lovely character, and the meeting between her and Wallace, after the battle, teems with pathos and poetry. The wavering and conscience-stricken Monteith, and the ambitious and treacherous Cumming, are vividly drawn, while the positions they occupy are strictly and powerfully dramatic. The interview between Eliza and her father, where she discovers him in the English uniform, previous to his betraying Wallace, is both startling and fine; nor can we remember any modern tragedy better adapted for theatrical representation than the one now before us, especially if a little care were bestowed on the alteration of a few passages.

We extract the following beautiful specimens, and leave our readers to decide for themselves.

"(Alarum. Re-enter Wallace bearing Florenna, who is wounded by an arrow.)  
Wallace. I hope it is not mortal—  
Here may'st thou rest in safety, and take breath.

Florenna. I feel a little faint—but 'twill be over—  
And I shall rest in peace!  
(Sitting down on a hillock.)  
Wal. O dear Florenna!

Speak not despairingly.—Alas! what brought thee  
Where war's rude shafts respect not whom they visit—  
But deal destruction to the fair and brave  
Promiscuously?—

*Flor.* Didst thou not bid me watch,  
And be thy guardian angel?—Yes! most kindly—  
And I did promise.—

*Wal.* Oh, 'twas but in thought!  
And not by deed—

*Flor.* I've watched thee long in thought,  
And wished to prove my fervency by action.  
And I am happy—though it may not last—  
But while I breathe—I will—

*Wal.* Sweet flower of beauty!  
Oh, droop not thus in hope's enamoured bloom,  
To desolate our hearts!

*Flor.* Where is my brother?  
*Wal.* Fear not for Graham—his sword exults in battle,  
And we shall triumph yet.

*Flor.* Ye are betrayed  
By Cumming's cowardice.—My fears prove true—  
Too true, alas!—but thou would'st not believe me.  
*Wal.* We are prepared to meet our fate like men;  
And Heaven can ask no more.

*Flor.* Oh, may ye prosper  
Still, in the care of Heaven, and Scotia's love!  
I could say much—but modesty forbids  
What death would yet allow me.

*Wal.* Name not death,—  
Floremma! thou wilt live.

*Flor.* When I am gone,  
Wilt thou tell Graham how his loved sister died?  
And say she blessed him with her dying breath  
For loving thee!—Oh, wilt thou tell him, Wallace?  
I would do more for thee!—I know thou wilt—  
Thy tears speak feelingly unto my heart:  
And I could weep in sympathy of soul—  
But—oh, my day weeping is gone by,  
And the long night of sorrow—

*Wal.* Be composed;—  
And Graham will come to cheer thee.

*Floremma.* He may weep  
While thinking of his tenderness to me,  
And dreams of love!—but he will tell thee all!  
And I shall be thy guardian angel still,  
In yonder sphere. I will request that favour,  
Even for thy sake! and Heaven shall grant the boon,  
To watch o'er those who shared our earthly love!  
Oh, 'twill be ecstasy to gaze on thee,  
Beloved of heaven, and idolised by men,  
For virtuous independence to the last,  
Exalting Scotland's glory!"

*Bibliotheca Cantiana: a Bibliographical Account of what has been Published on the History, Topography, Antiquities, Customs, and Family History of the County of Kent.* By John Russell Smith. 8vo. pp. 360. London, 1837, J. R. Smith; Canterbury, Ward; Rochester, Vidion; Dover, Batchellor; Ashford, Elliot; Chatham, Burrill; Maidstone, J. Brown, C. Brown; Dartford and Bromley, Dunkin; Greenwich, Richardson; and West-erham, George.

This volume belongs to a class of great utility, and requiring much diligent research and attention in all its parts to render them what they ought to be. We congratulate Mr. Smith on the performance of his task. His work is a *sine qua non* to every Kentish library; and one which the general historian and antiquary will do well to consult. It seems to us to be very accurate and complete; and we are sure that it contains much curious and valuable information—local, biographical, topographical, antiquarian, bibliographical, statistical, and national. We recommend it heartily; though it is not in our power to convey any particular notion of its merits by entering into details or making extracts.

A single example must suffice to shew his manner of treating his subjects.

"The History of Kent, in Five Parts, containing:—1. An exact Topography or Description of the County; 2. The Civil History of Kent; 3. The Ecclesiastical History of Kent; 4. The History of the Royal Navy of England; 5. The Natural History of Kent, by John Harris, D.D. and F.R.S., Vol. I. folio. London, 1719.

"Collation.—Title, Dedication, Preface, an Ode by P. Motteux, List of Subscribers, &c. 8 leaves. History of Kent, pp. 592; Index, Additions, and Emendations, pp. 40; Plates.—Portrait of Harris; Map of the County, surrounded with the Arms of the Subscribers. 1. View of Preston Hall, p. 39; Broome, p. 34; Chilton Manor, p. 41; Wierton, p. 49; Boughton Court, p. 49; Chart Sutton, p. 60; Tragnall, p. 72; Cheneving, p. 74; High Street House, p. 75; Chepsted Place, p. 75; Aldington West-Court, p. 98; Smith's Hall, p. 120; Tutsham Hall, p. 121; Goodnestone, p. 132; Mount Morris, p. 156; Ightham Court, p. 162; Knowlton, p. 171; the Grange, and Leyburn Castle, p. 172; Leeds Abbey, p. 176; the Mole, p. 192; Beachborough, p. 216; Oxen Heath, p. 235; Penshurst, p. 236; Plate of Antiquities, p. 246; View of

Rochester, p. 251; Knoie (3 Plates), p. 278; Kippington, p. 278; House of Dr. Fuller, Sevenoaks, p. 279; Lee's Court, p. 280; Tunbridge Wells, p. 292; Sundridge Place, and Bore Place, p. 303; Inories, p. 306; Map of the Isle of Thanet, p. 313; Mappa Thaneti Insule, p. 315; Waldershare, p. 325; Squieries, p. 329; Pendock, p. 330; Deane, p. 333; Reculver Church and Beacons in Kent, p. 345; Map of Romney Marsh, p. 348; Kite Coty House, a Janus's Head, and Dover Castle, p. 371; also three Woodcuts on pp. 89, 218, and 383.

"Dr. John Harris was born about 1667, and received his education at St. John's College, Cambridge, where he took his degree of B.A. in 1687, and that of Master in 1691. Having taken orders in the church, he obtained considerable preferments. He was first instituted into the rectory of Barming, in this county, which he resigned for St. Mildred, Broad Street, London; he had, also, the perpetual curacy of Stroud, and a prebend in Rochester Cathedral: he wrote a variety of sermons and treatises on the mathematics; a compilation of voyages and travels, in two volumes folio; but the work for which he was most eminently distinguished, was his 'Lexicon Technicum' or, an Universal Dictionary of Arts and Sciences,' the first book of its kind published in this country, and from which originated all the other dictionaries of science and cyclopedias which have appeared. Though Harris was a man of unquestionable abilities and attainments, he was charged with culpable imprudence in his conduct; and, notwithstanding the preferments he enjoyed, was generally in distress. He died, Sept. 17, 1719, an absolute pauper, at Norton Court, and was buried in Norton church at the expense of John Godfrey, Esq., who had long been his friend and benefactor. His 'History of Kent' was published shortly after his death, which, though he had been engaged on it eight years, contains but few alterations from the former descriptions of this county, and as few continuations of families, the owners of the several manors and estates, concluding with the possessors of them in Philip's time, 1686. What progress the doctor made towards the second volume, which was to have contained the history of Rochester Cathedral, an account of the eminent persons of the county, the religious foundations, and a history of the royal navy, is not known. Dying insolvent, his papers came into the hands of Edward Goddard, Esq., of Chiffe Pyppard, Co. Wilts, who had them in 1761. Hasted made every inquiry after them when he was writing his history of the county, but gained no knowledge of them.—Gough, Rees, Hasted."

We shall only subjoin two brief passages; the first on account of its being capable of a rather startling double construction; and the last as a fair bull.

"A Tear of regret to the memory of Lieut.-Col. Shadwell, who was murdered at Wrotham, June 1, 1799, by the Rev. William Cole."

[N.B. The Colonel was really murdered by two deserters, and not by the clergyman, who only wrote the "Tear," &c.]

Edward Hasted "died at the Master's Lodge of the Lady Hungerford's Hospital, Corsham, Wilts, at the advanced age of 80, Jan. 14, 1812. By Anne, his wife, who died in 1803, Mr. Hasted left four sons and two daughters.—*Gent's Mag., communicated by Hasted himself.*"

Here we bid our worthy compiler adieu, and have merely to request our readers, if they like parallels to these *facetas*, to have the goodness to turn to our review of *Chelsea Hospital*.

#### *Chelsea Hospital, and its Traditions, &c.*

[Second notice.]

IN our last No. we described, very briefly, the interesting features of this publication. Of the Christmas-day tumult at Canterbury, and the Maidstone fight, both connected with the rising in Kent (1647, 8), Mr. Gleig has, as we observed, made an excellent use for the object he had in view; though it was no easy matter to equal, still less to exceed, the records extant of those transactions in the numerous contemporary tracts\* which then supplied the place of newspaper intelligence. The most famous of Marlborough's campaigns, the prototypes of Wellington's, are also illustrated with historical

\* Such as "Canterbury Christmas, or a True Relation of the Insurrection in Canterbury on Christmas Day, with the great Hurt that befel divers Persons thereby;" "The Designs of the Rebels in Kent, at their Rendezvous the day before the Storming of Maidstone;" "Bloody News from Kent, being a Relation of the Fight at Maidstone and Rochester;" "Sad News out of Kent, &c., in a Letter from Chatham, of the Rising at Maydstone, &c., and their Intentions to Randevouse at Blackheath"—which, if they had done, by the way, the results might have been widely different.—*Ed. L. G.*

truth as well as peculiar spirit; and Neil Campbell's adventures give life to the Spanish war of Peterborough. The story of Catherine Welch (which is related to exhibit the wars of King William) is a very remarkable one, and seems to derive little addition or embellishment from the author's pen. He states that—

"In the list of old admissions into Chelsea Hospital there is one entry which I am bound to transcribe, in defiance of the shock which its peculiar phraseology may give to minds as sensitive as my own. It runs thus:—'19th Nov. 1717. Stair's Dragoons: Catherine Welch, a *fall jolly* breast woman, received several wounds in the service, in the habit of a man;—from the 19th July, 1717.' The reader will easily believe that the perusal of this legend excited in me no common desire to discover something of the history of the individual to whom it referred. I take it for granted that a similar feeling is at this moment operating with him; and it is, therefore, very satisfactory to me that I am in a condition to gratify his curiosity. Catherine Cavenaugh, otherwise Catherine Welch, otherwise Catherine Davies, otherwise Mother Ross, was born in Dublin, some time in the year 1667. She was the daughter of an honest and industrious couple, who earned their livelihood,—the husband by managing a malthouse and brewery, the wife out of the proceeds of a farm, which in her own name she seems to have rented. They do not appear to have had any other children than Catherine,—at least my authorities make of such no mention; and Catherine became, in consequence, a prodigious favourite with them. It was the height of their ambition to render her an accomplished woman, for which purpose they sent her to one of the best schools in the city. But Kate's views were in these respects at variance with those of her parents. She learned to read and write, and to use her needle; but in scholastic life she never advanced further. On the contrary, having a strong passion for out-of-doors occupations, she insisted on residing at the farm, where she handled the flail and guided the plough with as much dexterity as the best of her mother's labourers. Several instances are recorded of her juvenile habits, of which it is unnecessary to say more than that they entirely acquit her of all undue leaning to the weaknesses, bodily and mental, of a woman's nature. I find, for example, that at eighteen she would mount astride upon the wildest horse, and leap him, without saddle or bridle, over hedge and ditch. She had a passion, likewise, for the refined amusement which is still, I believe, prosecuted at Greenwich Fair, namely, rolling down hill in company with a whole troop of persons of like tastes and habits. And, as to her personal strength and agility, take this as a specimen:—When the ceremony of proclaiming James the Second was in progress, in 1686, Kate happened to be perched on the top of a haystack. She was determined to witness the whole affair; so, making but a single step to the ground, she vaulted over a five-bar gate, and jostled her way through the crowd, till she reached the heralds themselves. I am afraid that there is in all this very little that appertains to the romantic or the tender; yet was Catherine not without her amiable points, too, as will be discovered in the sequel. Whether Catherine's father was a Roman Catholic or a Protestant, I have not been able to discover; but in politics he was a sturdy Jacobite; for, when James came to Ireland, after his expulsion from the English throne, our brewer, among others, took up arms in his defence,

'He sold all his standing corn and other valuable effects,' says my authority; 'and with that money, and what he had by him, he raised a troop of horse, and set out at the head of it to join the king's army.' And here again his daughter, while the process of enlistment was going on, exhibited unquestionable symptoms of that firmness and intrepidity which were in due time to win for her an exalted niche in the temple of Fame. Mr. Cavanaugh, more learned in the qualities of malt than of horseflesh, bought a charger which neither he nor the boldest of his troop could ride. Kate took him in hand, and soon gave him to the captain as pliable and gentle as need be. Nor was this all. One day a riot took place at the door of a church within which Kate's mother was engaged in her devotions; and a party of Jacobite soldiers were marched thither, to make prisoners of the congregation. Kate swore to deliver her mother at all events; for which purpose she armed herself with a spit, and used it so effectually that, after running the sergeant through the calf of the leg, she burst the cordon, and brought off her mother in triumph. She had well-nigh been brought into trouble for this exploit,—indeed she was some time in confinement; but the father's zeal in the exiled monarch's cause being weighed against the daughter's indiscriminating violence, Kate was set at liberty. The author to whom I am mainly indebted for these facts has judged it expedient to mix up his sketch of Catherine's life with an outline of the military operations that took place in Ireland during the eventful years that immediately succeeded the Revolution. It is not my purpose to follow his example in these respects; for I do not find that Catherine took any part in the struggle. On the contrary, she appears to have lived quietly with her mother at the farm in the country; whence she removed, at the termination of the war, to Dublin, and became the companion and assistant, and eventually the successor, of an aunt who kept a public-house not far from College Green. Here, then, we find her established in a line of life which may be supposed to have accorded well with her singular temperament and disposition. Yet it must not be imagined that Catherine, either as an inn-keeper or a breaker-in of fierce horses, was wholly insensible to the tender passion. Long before her settlement on College Green, she had given her heart to a cousin of her own, who behaved ill to her. She, accordingly, renounced his society, and, with her usual firmness, resisted all his endeavours to reinstate himself in her favour; but she did not, on that account, lock up for ever the kindly feelings of her heart. There was in her own employment an insinuating tapster, Richard Welch by name, who found in his mistress's eyes especial favour, and who was brought to comprehend and take advantage of the good fortune that had befallen him, by means illustrative of the delicacy of sentiment which formed a striking trait in Catherine's character. Kate sighed in private for her amiable drawer, but could not, of course, make the first advances. She, therefore, commissioned an intimate friend to acquaint him with the real nature of his position; not abruptly or by positive assertion, but quietly, by hints, and insinuations, and all those unostentatious but efficient means of proceeding in which, I am sure most unjustly, women are said to be versed. Now honest Welch was slow of comprehension. He could not believe at first that 'the lot had fallen to him on such pleasant ground'; indeed, it was not till the kind confidante assured him, 'she

knew almost enough of the matter to promise him success,' that he could be induced to move. But he did move at last: and having been abruptly rejected, and told 'to mind the business of the house, and not her, which would better become him'; lo! his mistress softened in her ire. In one word, before the week was out, Catherine Cavanaugh had become Mrs. Welch, and Mr. Welch, landlord of the 'Pig and Bagpipes.'"

For her subsequent extraordinary career as a light-horseman, and a camp sutler, we must be content to refer to Mr. Gleig, a taste of whose talent for describing it may be enjoyed from the sample we have had room to give. The taking of Quebec is a more general narrative; and this, with some further accounts of Chelsea Hospital, concludes the second volume.

In the third we are treated with further details and accounts of recent improvements, admirably written; and then follow a series of wild, supernatural traditions, and anecdotes of tragical events which have happened in various branches of the service. A touch of French imprisonment at Verdun, a sketch from Waterloo, and the real personal biographies of several pensioners, including two or three centenarians, and a simple and affecting one of George Thornton, who died last year, aged 42, conclude the interesting miscellany, of which we regret that we can give but so imperfect an idea. Of Mr. Gleig's feeling, however, one short extract may suggest a faint notion; he is speaking of the funeral of a pensioner, the grave surrounded by his aged comrades:—"Therefore, (he says) not with the indifference which often marks the manner of those whose career has been less exposed than his own to difficulties and temptations, does the old soldier listen to the short and beautiful service which our church has appointed to be read at the burial of the dead. On the contrary, he feels where common men scarcely hear: and from his soul comes the Amen which answers to the touching petition, in which 'we meekly beseech our Father to raise us from the death of sin to the life of righteousness; so that when we shall depart this life we may rest in Him, as our hope is this our brother doth.'"

Of the superstitious legends we shall copy one as a sample. It is told by a corporal, and the scene is the banks of the Niagara near the falls:—

"There was (he tells) a man in my company, by name James Sweetlove, an honest, simple-minded, quiet fellow,—a good soldier too, as far as sobriety and cleanliness contribute to make a soldier, but altogether deficient in the sort of spirit which goes far to carry him through whatever difficulties and dangers may beset him. Sweetlove was married, and, having left his wife and two children in England, never ceased, from the hour of his arrival at head-quarters, to bewail his hard fate. He was exceedingly attached to them; it had well nigh broken his heart to abandon them; and the constant burden of his song was, that they would never meet again. All arguments, all jokes, all remonstrances, failed to turn him aside out of this melancholy state of feeling. 'Well, well,' was his habitual answer, 'you may say just what you please, but when I embraced my wife and little ones on the beach at Portsmouth, something whispered in my ear, that it was for the last time; and you will see whether or not it spoke truly.' Jem Sweetlove was on picket with me during the night of the 15th. It came to his turn to mount sentry by the river's side at midnight, and he went to his post, not gaily, for Jem was

never gay, but as free from oppression as we had seen him since he joined us. Well, I returned to the picket fire, after planting the reliefs, and had sat about half an hour, chatting, as men are apt to do in such situations with their comrades, when a musket-shot from the line of sentries caught my ear, and a general alarm was excited. We all stood to our arms; but the firing was not repeated, and no tumult in the front succeeded it. The officer, accordingly, after waiting about ten minutes, desired me to ascertain the cause of the shot; and taking with me a file of men, I hastened to obey his orders. Beginning on the right of the line, I ascertained, first from one sentinel and then from another, that all was quiet in the front, though they too had heard the shot, and for a moment had been startled by it. As I approached the centre, however, where Sweetlove kept post, the intelligence communicated was more explicit. In a word, it was believed that Sweetlove had fired,—but why, nobody could tell, for there had been no movement either on the river or along the opposite bank since the relief went round. Forward I now pushed, towards Sweetlove's station. There was no moon in the heavens, but the stars were out by millions,—and by their light objects could be discerned at some little distance. Carefully, therefore, I looked abroad, being unwilling to censure without reason; yet I could see nothing, except the mighty St. Lawrence rolling on in its solitude. I was, therefore, ready to discharge a volume of abuse at the culprit, when I beheld him make a sudden spring towards the river, cast his firelock from him, and jump in. 'Is the man beside himself!' cried I, as we ran forward to save him. Neither was it an easy matter to accomplish that object, for the current was strong and the channel deep; and the stream had swept him a considerable distance into the rapids ere we succeeded in getting hold of his clothes, and dragging him to the shore. It was no time to find fault when the poor fellow stood before me drenched and shivering, and looking as wild as a startled hare. I, therefore, contented myself by demanding from him, on our way back to the picket fire, an explanation of what had happened. At first he seemed unwilling to give it, but at length said—"It's all over with me, corporal! You have often ridiculed my assertions, that I should never see my wife and family again, but before many hours pass you will change your note. I shall be a dead man to-morrow." 'Pooh, nonsense! Jem,' cried I, 'this is the old story over again. Why, man, your chances are just as good as those of the rest of us, only you have no heart; and more die for lack of that than by sword or bayonet. Cheer up, cheer up! and tell us why you fired?' 'It was not I that fired. My piece went off in the struggle, but I never touched the trigger.' 'What struggle, Jem? for Heaven's sake don't speak in riddles! There was nobody near your post when we came up; with whom, then, could you struggle?' 'With my wife, corporal!' replied he. 'Ay, smile and look incredulous, if you choose, but what I tell you is a fact; and you yourself will admit that it was so, before to-morrow's sun goes down. Listen, then, and you shall hear all. You had not left me more than ten minutes, when, on making a face-to-the-right for the purpose of walking my rounds, I beheld, with what feelings you may judge, Margaret standing near me. She was very pale, very thin, and dressed in a long white wrapper. Her hair had broken loose, and was streaming from beneath her cap; and the expression of her eyes

was so sorrowful and sad, that it went to my very heart. For a moment she looked at me in silence; and then her thin white lips moved, and she said to me—'Jem, leave this place, or it will be too late!' As I hope to be saved, there was no delusion in the case. I heard the words as distinctly as I hear my own voice now; and I answered them by stating, that I neither could nor would desert my post. She repeated her entreaty; and, finding that I persisted in my determination, she seized my firelock, and strove to wrest it out of my hand. In that struggle the piece went off, and then Margaret, letting go her hold, drew back from me I know not how, for her limbs never turned, and her face was still towards me, with an expression in her eye of the same deep melancholy which had so much shocked me at the first. I gazed after her, when all at once I saw her with my two babies in a canoe. She was pale as before, but they were as red as my coat,—and a horrible red savage sat in the stern, and steered her towards the rapids. Margaret waved her hand to me, and said—'We meet to-morrow!' I saw that they were getting into the current; I heard the roar of the waterfall below. What could I do? I cast my firelock from me, and sprang into the water to save them! Sweetlove told his tale with a voice and manner so calm and collected, that it was impossible to question his own firm belief in the reality of the vision. He persisted, too, in his belief that he should not survive the morrow, and appeared altogether so shaken that it was judged expedient not to employ him again as a sentry. He, therefore, sat by the fire all night; and when daylight came in, we saw that his hair had suddenly changed its colour. Five hours previously it had been dark brown; now it was as gray as that of an old man of ninety. But this was not all: the enemy attacked us soon afterwards in force, and our pickets were driven in, though not till Sweetlove, who behaved like a gallant soldier, had received his fatal wound, and fulfilled his destiny. But I have not yet done. About six weeks after the battle, letters arrived from England, one of which gave an account of the decease of Mrs. Sweetlove and her children; the children having sunk under an attack of scarlet fever, and the mother dying of a decline. Now, what think ye of all this, which is true as I am a living man?"

This is succeeded by a sequel, to which we have alluded in our notice of the 'Bibliotheca Cantiana;' and, in quoting it, we will shew that neither posthumous communications, nor bulls, are confined to the Kentish writer.

"Oh, if that be the sort of thing you are in search of," interposes a third veteran, "I can tell my stories, too; both of which may be authenticated by reference to an officer who holds rank in this establishment. For, to a certain extent, he was connected with both, and, I dare say, recollects them. The regiment in which I served was employed in the expedition to the Helder, in 1799, and part of it took a passage in the ship of war in which the officer to whom I have just alluded served, at the time, as a midshipman. Among other individuals embarked, was an Irish drummer, by name Corney Nolan, as brave a fellow as ever drubbed sheepskin or cracked a joke in the presence of an enemy. It was remarked of Corney, that, from the hour of his embarkation at Margate till the boats pushed off for the Dutch coast, he never once smiled. Had he been left to himself, he would have kept below during the voyage, for he seemed to have the greatest horror of the deck; indeed, he invariably quitted

it as soon as the muster was over, and hid himself among the berths. It was of no use to badger or tease him about his conduct. He would neither change it, nor explain the motives that swayed him, but answered, always,—'I have my reasons. Let me alone, and mind your own matters.' At last the Helder point was made; the boats hoisted out, and other preparations made to land. 'Now, then,' said we, 'Corney, tell us why you were so gloomy on board. It's not like you to be out of spirits; what ailed you?' 'Faith, then, I'll tell you, lads,' answered Corney, 'for we're out of the mess now, at all events. The devil, for one time, has told a lie, any how, and maybe he'll tell more. An ould huck lugged at my hand in Tipperary long ago, and said, that I'd die in the water. Now, I don't mind dyin' like a man, with the enemy afore me; but to be drowned like a blind puppy—I could not fancy that at all at all. But there's the land! Hurrah! boys; hurrah! and there's the French rascals a-top of it! Let's charge them! and I'll shew you how!' Just as Corney spoke, our boat ran into a shoal and grounded, about a hundred yards from the beach. There was a considerable surf running, through which it was necessary to wade; and Corney, being the first to jump in, took our present adjutant on his back, and began to push towards the sands. But before he took three steps a musket-ball struck him in the breast, and he fell dead. Corney, too, accomplished his destiny, for he died in the water, after all. This, then, is one of my stories; now for the other. When the same officer of whom I have already spoken held a captain's commission in the Royal Scots, he had for a servant one Sam Rogers, a man with whom I long lived on terms of great intimacy, and who, as he had received a superior education, so was he perfectly free from every thing like a tendency to superstition. On the morning of the day when we drove in the enemy's pickets into Flushing, he came to his master, and said that he had had a fearful dream, and wished to communicate its purport to somebody. 'What was it, Sam?' asked the captain; 'let's have it. I like to hear dreams above all things.' 'You need not talk so lightly of the matter, sir,' replied Sam, 'for my dream refers to you as well as to others.' 'So much the better, my good fellow,' cried the captain. 'Out with it; I'm dying to hear it.' 'So you shall, then, sir,' said Sam. 'I saw, in deep sleep, a dark cloud pass before my eyes, which gradually opened out, and displayed behind it a thin fleecy vapour, that floated up and down for some time. By and by, shapes began to appear on the vapour, and I beheld, to my astonishment, the coats of arms of several officers, both of the Royals and of other regiments. They were all marked in characters of blood. Below one was marked the word 'killed;' below another, 'wounded.' 'And what legend might mine bear, Sam?' demanded his master, still laughing. 'You will be wounded, sir; but Captain Talbot, of the 5th, will be killed, and Lieutenant Wallace of ours likewise. But this is not all. The shields melted away, and there came a voice from behind the cloud, which said, 'You must die also!' Now, sir, so confident am I that I shall not survive many hours, that I beg of you to ascertain whether every thing that you have committed to my care is safe.' The captain would have treated his request with ridicule, but Sam was determined; and he had his own way. The property to be accounted for was, indeed, of trifling value, for we landed at Flushing in the lightest possible order; yet Sam insisted

upon his master's taking charge of his own haversack. And it was well that he did so. Of the officers whom he named as doomed to the slaughter, neither escaped. He himself was killed early in the battle, and the captain received a wound, of which he still feels the effects, and will probably continue to feel them till his dying day.—Have not we soldiers, then, just as many warnings, both of our own fate, and of the fates of our comrades, as seamen? 'Pooh, pooh!' exclaims a fourth warrior, 'is that all that you can tell the gentleman? These are but every-day occurrences. But let him read this. It is a true copy of a letter that was delivered in by the person to whom it is addressed, and is yet preserved among the records of the Prize Office. Talk of men being forewarned of their coming deaths! That's nothing! Read my letter, sir, and ask the chaplain whether it is not a genuine document.' We take the epistle thus handed to us, and find what the reader finds below.

*'Copy of a Letter from Sergeant Thomas Davis, 76th Regiment, to his Wife.'*

*'April 15, 1811, Dublin.'*

'My dear dear wife,—I received your loving letter in Fermoy. I am very happy to hear that you are in good health, and my family. Dear Mrs. Davis, I have rote these three lines on the 15th instant, but I stopped my hand until the 24th of April, 1811, until I should see how I would pass the bord. I remain in Fermoy hospital for a long time. They turn me out uncured. I came on the coach to Dublin, having got a very good pass. I thought to remain in Dublin until I would pass the bord, until I would get some money to bring me home to my dear family. But when I came to Dublin I got worse. There is some prize-money coming to me, I hope that you will get for my family. Dear wife, I was going to rite to you for some money to bring me home, but now it is all over. Lord have mercy on me! I departed this life on Sunday, about two o'clock. I had not one shilling to bury me in a strange place. You may come to see where I am buried, if you chuse. I hope you will pray for me. Dear wife, I am no more in this world. If you come to Dublin, come to No. 11, Duke Street, Dublin. I have got a young man to rite for me, by the name of John Garland, I bein' so bad that I could not rite it myself. I was in hope of getting my half year's salary on the 24th of this month, and twenty pounds prize-money. No more at present from Thomas Davis, sergeant of 76th regiment of foot, Ireland. I remain for ever.'

"Is this really a genuine letter?" ask we. 'As genuine as the Bible!' answers our gallant friend, with imperturbable gravity; 'and, for my part, I think it a great deal more wonderful that a man should write to his wife after he is dead, than that a dead wife should appear to her husband, and tell him that his hours are numbered. Don't you think so too, sir?' 'It would be hard to decide between them,' is our reply; 'but this last has the merit of being more uncommon, at all events,'"

The bull is Mr. Gleig's own, and at page 239, vol. ii., where he says:—

"Accordingly, on the very morning after the receipt of this letter, she let her house, gave her children, of whom one was dead, in charge of her mother, and, disposing of her business, at a heavy loss, became free as the air of heaven."

*The Christmas Library, Vol. I.: Birds and Flowers and other Country Things.* By Mary Howitt. 18mo. pp. 208. London, 1838. Darton and Clark.

THIS is the most beautiful little volume that we have yet seen; the woodcuts delicious, and accompanied by poems as delicious. Mrs. Howitt must have had much enjoyment in forming this *Christmas Library*. First, the material, the store of future song, had to be collected; and, how many pleasant summer walks, and loiterings by the green-wood side, must have been conjured up, as their results were put into music and poetry! We have so many favourites that it is difficult to choose; still, the following justify a choice.

*"The Sea-Gull."*

Oh! the white sea-gull, the wild sea-gull,  
A joyful bird is he,  
As he lies like a cradled thing at rest  
In the arms of a sunny sea!  
The little waves rock to and fro,  
And the white gull lies asleep,  
As the fisher's bark, with breeze and tide,  
Goes merrily over the deep.  
The ship, with her fair sails set, goes by,  
And her people stand to note,  
How the sea-gull sits on the rocking waves  
As still as an anchored boat.  
The sea is fair, the sea is fair,  
And the sky calm overhead,  
And the sea-gull lies on the deep, deep sea,  
Like a king in his royal bed!

Oh! the white sea-gull, the bold sea-gull,  
A joyful bird is he,  
Sitting, like a king, in calm repose  
On the breast of the heaving sea!  
The waves leap up, the wild wind blows,  
And the gulls together crowd,  
And wheel about, and madly scream  
To the sea that is roaring loud!—  
And let the sea roar ever so loud,  
And the winds pipe ever so high,  
With a wilder joy the bold sea-gull  
Sendeth forth a wilder cry.  
For the sea-gull he is a darling bird,  
And he loves with the storm to sail;  
To ride in the strength of the billowy sea;  
And to breast the driving gale!  
The little boat she is tossed about,  
Like a sea-weed to and fro;  
The tall ship reels like a drunken man,  
As the gusty tempests blow.  
But the sea-gull laughs at the pride of man,  
And sails in a wild delight  
On the torn-up breast of the night-black sea,  
Like a foam-cloud, calm and white.  
The waves may rage, and the winds may roar,  
But he fears not wreck nor need,  
For he rides the sea, in its stormy strength,  
As a strong man rides his steed!

Oh! the white sea-gull, the bold sea-gull,  
He makes on the shore his nest,  
And he tries what the inland fields may be;  
But he loveth the sea the best!  
And away from land, a thousand leagues  
He goes 'mid surging foam:  
What matter to him is land or shore,  
For the sea is his truest home!  
And away to the north 'mong ice-rocks stern,  
And among the frozen snow,  
To a sea that is lone and desolate,  
Will the wanton sea-gull go.  
For he careth not for the winter wild,  
Nor those desert-regions chill;  
In the midst of the cold, as on calm, blue seas,  
The sea-gull hath his will!  
And the dead whale lies on the northern shores,  
And the seal, and the sea-horse grim,  
And the death of the great sea-creatures makes  
A full, merry feast for him.  
Oh! the wild sea-gull, the bold sea-gull,  
As he screams in his wheeling flight:  
As he sits on the waves in storm or calm,  
All cometh to him aright!  
All cometh to him as he liketh best,  
Nor any his will gainsay;  
And he rides on the waves like a bold, young king,  
That was crowned but yesterday!"

"The gull, notwithstanding the gorman-dising and rather disgusting character given of it by Bewick, figures beautifully in his inimitable wood-cuts; giving the very spirit of wildness and freshness to his sea-side sketches. The gull may occasionally be found far inland, domesticated in old-fashioned gardens, where it is an indulged and amusing habitan, feeding on slugs and worms, and becoming thus a useful assistant to the gardener. In this state it seems

entirely to throw off its wild native character, and assumes a sort of mock-heroic style, which is often quite ludicrous. We have seen one strutting about the straight alleys of such a garden, with the most formal, yet conscious air imaginable, glancing first on one side, then to the other, evidently aware of your notice, yet pretending to be busied about his own concerns. It was impossible to conceive that this bird, walking 'in his dignified way,' upon his two stiff little legs, and so full of self-importance, had ever been a free, wild, winged creature, wheeling about and screaming in the storm, or riding gracefully upon the sunshiny waters. His nature had undergone a land-change; he was transformed into the patron of poodles, and the condescending companion of an old black cat. With these creatures, belonging to the same place, he was on very friendly terms, maintaining, nevertheless, an air of superiority over them, which they permitted, either out of pure good-nature, or because their simplicity was imposed upon. They were all frequently fed from the same plate, but the quadrupeds never presumed to put in their nose till the gull was satisfied; and to his credit it may be told, that he was not insatiable, although a reasonably voracious bird on ordinary occasions. We saw last summer, also, a gull well known to northern tourists, which for twenty years has inhabited one of the inner green-courts at Alnwick Castle, and has outlived two or three companions. It is an interesting bird, of a venerable appearance; but, as it has been described in books, more need not be said of it. In one of the towers of this same castle, also, we were shewn a pair of perfect bird-skeletons, under a glass shade, the history of which is mysterious. They are the skeletons of a pair of jackdaws, which had built in one of the upper towers of the castle, and had been found in their present state, apparently nestled together. From the account given us by the porter, an intelligent old man, they appeared not to have been discovered in any confined place, where they might have died from starvation, but by their own tower, on the open roof, as if they had been death-stricken side by side."

*"The Hedgehog."*

Thou poor little English porcupine,  
What a harassed and weary life is thine!  
And thou art a creature meek and mild,  
That wouldst not harm a sleeping child.  
Thou scarce canst stir from thy tree-root,  
But thy foes are up in hot pursuit;  
Thou might'st be an asp or horned snake,  
Thou poor little martyr of the brake!

Thou scarce canst put out that nose of thine;  
Thou canst not shew a single spine,  
But the urchin rabble are in a rout,  
With terrier curs to hunt thee out.

The poor hedgehog! one would think he knew  
His foes so many, his friends so few,  
For when he comes out, he's in a fright,  
And hurries again to be out of sight.

How unkind the world must seem to him,  
Living under the thickest dusk and dim,  
And getting his living among the roots,  
Of the insects small, and dry hedge-fruits.

How hard it must be, to be kicked about,  
If by chance his prickly back peep out;  
To be all his days misunderstood,  
When he could not harm us if he would!

He's an innocent thing living under the blame  
That he merits not, of an evil name;  
He is weak and small—and all he needs  
Lies under the hedge among the weeds.

He robs not man of rest or food,  
And all that he asks is quietude;  
To be left by him, as a worthless stone,  
Under the dry hedge-bank alone.

Oh, poor little English porcupine,  
What a troubled and weary life is thine!  
I would that my pity thy foes could quell,  
For thou art ill-used, and meanest well.

*"The Sunshin."*

I love the sunshine every where,—  
In wood, and field, and glen;  
I love it in the busy haunts  
Of town-imprisoned men.

I love it when it streameth in  
The humble cottage door.  
And casts the chequered casement shade  
Upon the red brick floor.

I love it where the children lie  
Deep in the clovery grass,  
To watch among the twining roots  
The gold-green beetles pass.

I love it on the breezy sea,  
To glance on sail and oar,  
While the great waves, like molten glass,  
Come leaping to the shore.

I love it on the mountain-tops,  
Where lies the thawless snow,  
And half a kingdom, bathed in light,  
Lies stretching out below.

And when it shines in Forest-glades,  
Hidden, and green, and cool,  
Through mossy boughs, and veined leaves,  
How is it beautiful!

How beautiful on little streams,  
When sun and shade at play,  
Make silvery meshes, while the brook  
Goes singing on its way!

How beautiful, where dragon-flies  
Are wondrous to behold,  
With rainbow wings of gauzy pearl,  
And bodies blue and gold!

How beautiful, on harvest slopes,  
To see the sunshine lie;  
Or on the paler reaped fields,  
Where yellow shocks stand high!

Oh, yes! I love the sunshine!  
Like kindness or like mirth,  
Upon a human countenance,  
Is sunshine on the earth.

Upon the earth; upon the sea;  
And through the crystal air,  
On piled-up clouds; the gracious sun  
Is glorious every where!"

Again we warmly commend this delightful little volume.

*Hervé's Residence, &c.*

[Second notice: conclusion.]

WE left off with Mr. Hervé's arrival at Constantinople, and promised his sketch of the sultan, as a pair with the portrait of Otho. Here it is.

"I had (says the artist) a good view of him as he rode there and back. His countenance is not so fine as many of the aristocratic Turks; his nose is straight to the tip, then it swells out, and has a coarse red appearance, seeming to tell a Bacchanalian tale; his beard is black; his eyes are not fine, and have a sort of dizzy look; his stature is about the middle height, and he is not so corpulent as most of his ministers. He has much personal vanity. An Armenian, who has taken many miniatures of him, shewed me one which I did not find like him, observing, that he had given him a regularly straight nose, quite in the Grecian style. The artist replied, that he was conscious of that; but that the sultan wished it so, as he did not like the knubble at the tip, which totally spoiled the symmetry of that prominent feature. The painter also informed me that the extreme blackness of the grand signior's beard proceeded from his dyeing it; and he would not permit sundry red spots in the miniature, which in his own face were rather conspicuous. He was born in July 1784, but certainly has not the appearance of being near so old as he really is. His mother was French, and celebrated for her extreme beauty; she was taken, when very young, on her passage from one of the French colonies, by an Algerine corsair, and ultimately sold to the father of Mahmoud; she took great pains with his education, and succeeded, in some degree, in softening the natural ferocity of his temper; hence he is generally admitted to be less cruel than his predecessors. He is well known for having departed from many of the prejudices attached to the Mahomedan religion, and in none more conspicuously than his extreme devotion to the juice of the grape. At present, he interferes but little with the affairs of state, being rather of an indolent habit.

Most of those European ameliorations, attributed to his suggestions, which have been recently introduced into his dominions, having been principally effected by the seraskier, whilst those which regard the navy have been chiefly at the instigation of Tahir Pacha, the present capitan pacha, or high admiral. Mahmoud the second has been accused of many of those enormities which mostly deform the biography of sultans, as having his brother murdered, as also two of his females who were pregnant, in order to prevent any possibility of future aspirants to his throne. Some have even stated that he caused the death of his eldest son, with a variety of other crimes; but his partisans (even amongst the Franks) deny the truth of these accusations; moderate men doubt them; whilst his enemies confidently proclaim them; and an author is too apt to take the report of that coterie into which his introductions have mostly thrown him. When I saw the sultan, he was accompanied by his ministers and principal officers of his household. They were some of them very good looking as to features, but were mostly fat and short; the best-looking amongst them was his son-in-law; but, from their having adopted the European costume, they have no longer that dignified appearance which they once had when clad in that garb which was so thoroughly in keeping with the peculiar cast of their countenances. There were some men who walked in the procession whose feathers were as high nearly as the first floor windows: I never could have imagined any thing so tremendous in the shape of a plume. The most interesting objects of the whole concern were the horses, twelve of which were led, being the choicest specimens of the sultan's stud. They were so richly caparisoned, that it was impossible to conceive any thing more splendid; the housings of the saddle had on each side an ornamental trophy, entirely composed of diamonds and precious stones. As the spaces occupied by these decorations are larger than a man's hand, the value must be immense. The borderings are also formed of jewels, worked in various patterns. The animals were Arabians, of the finest race, and as perfect in their symmetry and proportions as if they had been selected as models of their species; I therefore must say that the quadrupeds, in their exterior, had much the advantage over the bipeds."

The description of the principal prison, or *bagnio*, is one of the most striking in the work; we quote a portion of its appalling details.

"Imagine human beings of a pale greenish yellow colour, then conceive a skeleton, with a skin the thickness of parchment stretched over it, the bones being as visible as if there was no covering drawn over them. The total listlessness of expression, as I regarded them, struck me most forcibly, whilst standing and contemplating what man could be brought to, by a privation of every nourishment, save that which was just requisite to keep bone and skin hanging together. The wretched victims, for one instant, cast their dying-looking eyes upon me, then let them fall on their tedious work, scarcely appearing to notice what passed before them. They were picking pieces of rope, or something of that sort, which was the labour assigned them. Their countenances had but one expression—a settled sadness, a feeble despair, which left not sufficient energy to move the head from its fixed sunken position, which remained unmoved, even though the eye was, perchance, uplifted. From their extreme thinness, the cheek-bone was remarkably prominent; and the cavity which contained the eyes

deeper than I ever before saw in any human being. They had no clothing, except such as decency demanded. To the waist, they were generally naked; and the scorching sun's rays were shining on their bare shoulders, when men, who had clothes to repel the intensity of the heat, were carrying umbrellas in the streets. What, then, must have been the endurance of these pitiable objects? I found, on inquiry, that they were mostly Kurds, or natives of Kourdistan, a district that has always been rebelling against the Turkish government; and the poor wretches, doomed to drag on a living death in the bagnio, were peasants who were compelled to follow their chiefs to the field, when they have rebelled against the porte, and having been taken prisoners, they know not whether their incarceration be for life, or for what period. Sometimes a number of them are taken out at night and thrown into the Bosphorus: and these poor fellows, who come from a far distant country, even when set at liberty, have no means of returning to their homes; therefore death in battle would be comparative happiness to that of being made a prisoner. I suppose they are not permitted openly to beg of visitors, as many made silent signs to me for money, but had the appearance of doing it in a concealed manner."

Tahir Pacha, we are told, was a great amateur of corporeal punishment. Mr. H. says—

"Whilst I was at Constantinople, all the captains of the ships of the line received, with the exception of two, by his orders, the bastinado. In another instance, when the fleet was performing certain evolutions before the sultan, one ship, which was American built, sailed much swifter than the rest, and passed that of Tahir: whereupon he went on board the offending vessel with a great stick, and immediately knocked down the captain, and cudgelled him as long as he could stand over him. This abrupt manner of correcting an officer for any dereliction of duty, or for any remissness of those under their orders, was not uncommon. Formerly, the Turks considered that they had the privilege of compelling a Christian to sweep the street before them; and, some time since, some low fellows put the broom into the hands of one of the first English merchants in Constantinople, who, highly indignant, went immediately and complained to the sultan, by whose orders the minister of police was instantly sent for. The moment he entered he was flogged by two men with clubs; and would certainly have been despatched, had not the merchant interfered, and entreated that the chastisement might cease. When the sultan observed, 'Ah! that is the way you Franks always behave: you come to me and make a complaint, then when I attempt to award the punishment that is merited, you always interfere to prevent it.' 'But,' said the merchant, 'the minister was not present; therefore, how could he help it?' 'True,' replied the sultan; 'but he ought to have preserved the police of the capital in such a state, that so flagrant an outrage could not have occurred. Had those who were under his command been at their proper stations, some one would have been within call, and, at the moment, would have punished the delinquents:' adding, that it was the practice of the porte, when any thing did not work well in any branch of the legislature, to punish the heads of the department, leaving them to chastise the underlings. A friend of mine met with a still more extraordinary instance of the roughest discipline being inflicted on persons, without any knowledge whatever that they were the

offenders of whom complaints were made. He was travelling in Egypt, and passing through a village, had some stones thrown at him by some youths, one of which hit him. He complained of this to Ibrahim Pacha, who immediately ordered four young men of the village to be flogged,—no matter whether they were the persons who had done wrong or not,—because, he contended, his object was to prevent the recurrence of such a circumstance. 'And now,' added he, 'when the inhabitants of that village find that any one of them is liable to be flogged for an outrage on a stranger, they will always, one and all, exert themselves to prevent any one that might pass through being insulted, for their own sakes.' Ibrahim further observed, 'that he should consider it highly injurious to his country, were it stated in the English papers that travellers had stones thrown at them with impunity, when passing through the villages in Egypt, as it might give the British people a very bad opinion of the administration of the laws in our nation.'"

We are not very sure whether this is or is not the better way of repressing crime. *Certes*, it would prevent many idlers from looking on, and encouraging it. But we must now hasten to a conclusion. In company with a Genoese, of the name of Castelli, our countryman travelled on horseback to Belgrade, by Adrianople, and across the Balkan. Of their adventures, there is not much to remain on the memory; but we pick out a variety or two.

At Adrianople, "after having taken leave of the pacha, we went to see his stud, consisting of about a hundred and fifty horses; some amongst them were most beautiful creatures: all the finest were Arabians: the greater number were for the saddle; but some were for his carriages. One of his horses the pacha had mentioned to us, as being a great favourite, though now twenty years of age, and would take a pinch of snuff and smoke a pipe. We saw this extraordinary animal: it was a fine milk-white steed; and witnessed its taking the pinch of snuff, or rather the receiving it, as the man put it in one nostril, it immediately turned up the other for some more, at the same time, by whinnying, expressing its satisfaction.

"The next day we found Tartar Bazatjik to be a town of more importance than we had imagined. As we advanced, our anxiety to mount the far-famed Balkan increased: however, we yet had several halts to make before the ascent was to take place. They have a singular custom in this part of the world, after you arrive and have dismounted, they walk the horses slowly round a circle for about ten minutes before they put them in the stable: doubtless the motive is to cool the cattle gradually." [To be sure it is: and done at every hostelry throughout England and Scotland].

The quarantine at Semlin was annoying enough, and in the transit thence through Hungary to Vienna, Mr. Hervé observes, that all the lower orders proved themselves to be cheats and liars. But the writer says, notwithstanding their impositions, "I really must give the reader an idea of the ridiculously cheap charges which were made for our bed and board at Neussatz. We had, on arriving, breakfast of eggs, coffee, and bread and butter; we had a tolerable dinner of several dishes, with wine of the country, and dessert; in the evening we had tea, and breakfast again the next morning; and our whole bill only amounted to three francs and a half, making the proper calculation from florins into French money.

At our first starting, the country was pleasant, and had a social air, but we often had to traverse the most uninteresting and uncultivated plains. We were always delighted to see a village, as the aspect was ever cheerful. The first stoppage we made was at the driver's own cottage, which had a very comfortable air, and his crops around it bespoke plenty. We certainly had four stout horses, who appeared capable of pulling us through, but we sometimes found the roads more than a match for their strength. We met numbers of the country people: the costume of the men was most singular, consisting of an immense coat reaching nearly to their heels, made of sheepskins; and in wet weather they wear the wool side outwards, which has a most rough and savage appearance, and makes them look like wild beasts. When it does not rain, or threaten to do so, they wear the skin side of their coats for the exterior, and they have them very curiously worked, by having little bits of different coloured leather let in, so as to represent flowers. On their heads they wear a large round hat, with a tremendous brim, which is turned up all round, and holds the water like a dish; so that I have seen them in hard rains, every ten minutes take off their hat to empty it of its accumulation of water. They all wear large Hessian boots, their hair very long, and mustachios: their heads always put me in mind of the pictures of Oliver Cromwell. Some of the women looked to me exactly like our own village girls,—cotton gowns, and caps, appearing to be worn much in the same way as in England; others had jackets trimmed with fur,—appearing more foreign and picturesque. Many of the females also wear Hessian boots: I observed that they very often had pretty features, appeared active, and had rather a lively expression."

The obverse is thus painted:—"Through masses of mud, we again resumed our journey, and were much astonished at the extreme indelicacy of the women, who, as they waded through the dirt, took up their clothes to such a degree of indecency, that I am sure the commonest London prostitutes would not have had the audacity to have done. I was sitting in front of the wagon next the driver, when I first observed one of these shameless creatures; much surprised, I turned to him, expecting to see in his countenance and manner an equal astonishment, but found that he took no notice; and afterwards I perceived that it was the custom of the country, and that all the women of the lower class, old and young, seemed equally dead to any feeling of shame or modesty. At all the inns we stopped at, the extreme forwardness of the females was conspicuously remarkable. Travellers really see such extraordinary things, that when they record what they have seen, their assertions are received with such a smile of incredulity, that one is almost afraid to relate what one has actually met with, as no man likes to have his word doubted. I, therefore, laid violent hands upon Castelli, bidding him look at, and well examine a cross of a most singular appearance, which, on close inspection, we found to be intended for our Saviour, with a glory round his head; but they had actually dressed him in the costume of the present day, in buckskin breeches, and jockey boots. Had I not had ocular demonstration of such an absurdity, I could not have believed it."

Before quitting our work, we must express our opinion, that Mr. Hervé is very unlucky, and is often vulgar when he attempts to be very facetious. What he means by "besiffling smile," we cannot guess, and possibly the fol-

lowing bits will not be thought more intelligible or amusing:—

"I well remember seeing the king most closely watched during the progress of his raising a cup of tea to his royal lips, by two vigilant observers, who waited impatiently the moment when the cup should be empty, that they might fly to the aid of their monarch, and disburden him of the vacant vessel. These aspirants for royal favour, were situated at opposite sides of the room, and unfortunately made a rush at the same instant, whereby they came most violently in contact, within a few inches of their sovereign. Now each of these gentlemen had a proboscis so far exceeding the usual proportions, that when their two faces struck together, the concussion was audible; the king advanced a few paces to ascertain the extent of the damage; a powerful sensation was excited throughout the assembly, until it was ascertained that one of the victims had sustained but little injury. The other, however, whose nasal charms appeared to be of a more tender and susceptible nature, bled most copiously, whilst I could not resist congratulating him on his good fortune, in thus having had an opportunity of shedding his blood in the service of his monarch. At first he half thanked me for my condolence, but observing some of the bystanders inclining to smile, he looked at me with a sort of expression, which seemed to indicate he would rather I had held my tongue."

"Yet I was much better off than a friend of mine, who arrived at Epidaurus at another period, and was not so fortunate as to be conducted, as I was, to the best inn in the place, but was ushered into one considerably inferior, where they had not even the aforesaid shop-board; consequently, his mattress was laid on the floor, which was, as usual, the unspoiled earth; but, having observed that there was a great pig, which appeared to have the run of the house, he began to entertain sundry suspicions that the pig would be walking upon him in the night, whilst he might be asleep, and communicated his apprehensions to his landlord and landlady, who assured him that the pig never went into that corner where his mattress was laid. My friend, however, could not understand why that spot should be more respected than the rest by this ambulating swine, and retired to his pillow, very sceptical on the subject, his doubts and fears, for a long time, keeping him awake. At length, fatigue and drowsiness operating upon him, he sank into the arms of Morpheus. How long he had remained in that delicious state of unconsciousness is hard to say, when he was disturbed by a tremendous pressure on his cheek; and naturally turning his head, the pig's foot (for it was the pig's self that pressed) slipped into his mouth, being well charged with an accumulation of mud and filth, collected in its nocturnal promenades. My unfortunate friend sprang on his feet, spitting and spluttering, endeavouring to clear his mouth of its unwelcome contents; at the same time, with stentorian voice, vociferating an anathema against the accursed hut and its inmates, he rushed into the air, and sought a brook that 'babbled by,' and there performed an ablution which had become highly necessary."

An indelicacy, pages 165-6, vol. i. forbids repetition; and another, page 390, about un piccolo piccolo, one would hardly think worth robbing Joe Miller of.

But enough of these sillinesses: and we conclude that, though there is little to be learned from these volumes respecting Greece

or Turkey, there is that sort of entertainment which we have indicated for anecdote and gossipmongers.

#### BOOKWOOD.

THE great popularity of this highwayman-hero has, we observe, already brought his adventures, by Ainsworth, to a fifth edition, and to the still more popular form of one (No. 60) of Bentley's standard novels. The frontispiece and vignette, by Cawse and Greatbatch, do credit to both artists and to their subjects; but we can only adopt a quotation from the preface to this revised, corrected, illustrated, and noted copy of the life of a long-time-ago corrected and noted robber.

"The ride to York," says the author, "a portion of the work which appears to have enjoyed the greatest share of favour, cost me the least time and the least trouble in execution. It was written in a few hours as the equestrian feat described took in its accomplishment. My pen galloped over the leaves with unwonted ease, and with unwonted celerity. So thoroughly did I identify myself with the flying highwayman, that, once started, I found it impossible to halt. Animated by kindred enthusiasm, I cleared every obstacle in my path with as much facility as Turpin disposed of the impediments that beset his flight. In his company, I mounted the hill-side, dashed through the bustling village, swept over the desolate heath, threaded the silent street, plunged into the eddying stream, and kept an onward course, without pause, without hinderance, without fatigue. With him I shouted, sang, laughed, exulted, wept. The whole panorama of the country between London and York seemed to pass before me; and, as I had not, at that time, travelled along the Great North Road, I was surprised, upon verifying my descriptions (which I did before the appearance of the work) to find them tolerably accurate. The pains of authorship are great; but its pleasures, when they occur, are greater. And among the latter, I may instance the composition of this 'ride to York.' It is curious that, besides Turpin, there are two other claimants to the distinction of this remarkable achievement, and equally curious that both these claimants should be brothers of the blade. The first of these, Will Nevison, was a noted highwayman, who flourished in Charles the Second's time, and feigning death, during the prevalence of the plague, was carried out of the castle at York by his confederates, and subsequently rode, it is stated, from that city to London in a single day. Nevison's irons (if I remember rightly) form part of an interesting collection of knives, saws, pistols, hatchets, bludgeons, daggers, stakes, and other blood-stained implements of destruction, exhibited by the York gaoler, who, by the by, is a great stickler for Will's equestrian reputation, and contends that Turpin has robbed him of his laurels in this particular matter of 'the ride.' With becoming deference, however, to the opinion of this well-informed gentleman, I would venture to state that I can discover no record of such an exploit in the meagre accounts of his hero; nor is there any allusion to any such performance, accomplished by any person whatever, that I can meet with, earlier than 1758. In the 'Narrative of the Life and surprising Robberies and Adventures of William Page,' published in that year, the ensuing passage occurs. 'One instance,' says the historian, referring to an attempt, on the part of Page, to prove an *alibi*, 'I myself remember, which happened

upwards of thirty years ago. This was Harris, the famous highwayman, who robbed on the black mare. He committed a robbery in the morning, in Surrey, on a gentleman who knew him perfectly well; and, therefore, Harris rode for it with such speed, trusting to the goodness of his mare, that in the evening, about sunset, he appeared on the Bowling Green at York, and, pulling out his watch, shewed it to the gentlemen present. But, notwithstanding this prodigious performance; namely, the riding one hundred and ninety-four miles in one day, so positive was the evidence against him, that he was convicted upon it. The old Duke of Richmond, as I remember, was so charmed with the vastness of the performance, and the bravery of the man, that he interceded for his life, and obtained it, on condition that Harris would give him his word and honour never to be guilty of the like offence again. Harris gave him his faith that he would not, and was as good as his word. He immediately set up a fencing-school; and afterwards married a woman of fortune at Steyning, in Sussex, where he lived in reputation till his death. This is, unquestionably, a curious story; and if Harris be not an *alias* of Turpin, I can scarcely tell what to make of it. Here we have the 'black mare,' the 'ride to York in a single day,' and the incident of the 'watch shewn to the gentlemen on the bowling-green,' told of Turpin at Hough. It is quite certain, that in all the records of crime to which I have had access, no memoir of any highwayman of notoriety, rejoicing in the aristocratic name of Harris, is to be found. It is equally certain, that before Turpin's day, the question of such a 'ride' had never been mooted; and it is highly probable that Page's biographer, partially informed upon the subject, may have substituted one name for another, and related a traditional anecdote of Turpin, with some trifling embellishments of his own. The date referred to (1728) coincides with the supposed period of Turpin's exploit. Be this as it may—and it is impossible to settle so important and so perplexing a point, if the ride in question was actually performed by Nevison, Harris, or Turpin (no matter which of the three)—it is a feat unrivalled in the annals of the sporting world; and such as Mr. Osbaldeston, or any other 'crack rider' of our time, would vainly strive to emulate. It could only have been undertaken, only have been executed, by a highwayman!"

*Apropos* of extraordinary feats of horses, we heard an instance the other day, which, though we (having seen the horses after the feat) can vouch for the truth of the fact, greatly surprised us. A gentleman had related the performance of an extraordinary pony which was driven twenty miles within the hour; and others referred to the famous wager won by the late duke of Queensbury, when they were all eclipsed by an individual, who asserted that he had witnessed a pair of horses, on the very day preceding, with a carriage, certainly a light carriage, go the *unexampled distance of ninety miles in three successive hours!* The statement was more than questioned; and, like most of such cases, ended in a bet, which the assertor won. This was only a fortnight ago.

## MISCELLANEOUS.

*The Squire.* By the Author of the "Heiress," a Novel. 3 vols. 12mo. London, 1837. Bentley.

THERE is nothing in these pages that calls for criticism. The story is pleasantly told enough, but full of those improbabilities, dangers, and

discoveries, which have long formed the staple of circulating commodities. The character of the Squire, rough but kind, hasty yet well meaning, is natural and well drawn.

*Stirring Stanzas on Her Most Gracious Majesty's Invitation to the City.* By Daniel Dump, Esq., Deputy of Dowgate. Pp. 37. London, 1837. Smith, Elder, and Co.

A FUNNING piece of wagguery on the approaching festival, and an amusing squib enough, without ill-nature or personality.

*Yarrell's History of British Birds, Part III.* London, 1837. Von Voorst.

HAVING in this part concluded the group of Falconids, our very able naturalist proceeds to that of the Strigids, and begins with the Eagle Owl, the figure of which, by the by, seems to us to be rather short and squab, though *certainly* these (in our eyes) handsome birds can ruffle out their plumage wonderfully. The sense of hearing in the owl is very acute, and they are usually divided into the tufted and the smooth headed, the former having two tufts of feathers, or ears, to grace their whimsically sagacious countenances. The scops-eared, long-eared, short-eared, the white or barn owl, the tawny, the snowy, the hawk, and the little owl, are also well engraved and well described.

*The History of the French Revolution, No. I.*, by M. A. Thiers. 8vo. (London, Bentley.)—This is a very cheap and neat edition of M. Thiers' celebrated History of the French Revolution. The character of the work is too well known for comment; and the Number before us, is ornamented with characteristic embellishments. *Cabinet Cyclopædia: History of England, Vol. VII.* 12mo. pp. 384. (London, Longman and Co.)—Shewing the same industry in collecting material as its predecessors; but not calling by any originality for careful criticism.

ARTS AND SCIENCES.  
BOTANICAL SOCIETY.

THURSDAY evening, Dr. Macreight, V.P. in the chair.—The routine business being gone through, Dr. Bossey read part of a paper, 'On the Plants which have been observed to produce the Ergot.' The parasitic fungi have an especial claim to the attention of the botanist, the agriculturist, and the medical practitioner, from the remarkable effects which they produce on the growth and development of the plants to which they are attached; from the influence they exert on the quantity, quality, and value of crops; and as being the source of a most potent and useful medicine, and the cause of a fearful and fatal disease. The species treated of were, first, the *Uredo segetum*, the dust, brand, smut, or burnt-corn of the farmer. The genus *Uredo* consists of pulverulent parasitic fungi, developed beneath the epidermis of living plants, and composed of small, free, unilocular sporidies, or reproductive vesicles, which are filled with minute sporules, or seeds; and the species *Uredo segetum* consists of a scentless black powder, residing within the fruit or glumes of the grasses, by which the normal structure of the grain is wholly destroyed. The grasses affected by this species are rye, wheat, barley, and oats. The attack commences long before the corn is ripe, even while it is enclosed in the vaginal sheath; and it is matured and dispersed in the state of a dry black powder before the harvest. The only ill effect on the animal economy produced by this species is said to be the occurrence of ulcers on the legs of persons walking in fields affected by it. The next species possesses the same generic characters—is called, by farmers, pepper-brand, stinking-brand, or smut-balls, and by botanists, *Uredo caries*. It differs from the former, however, in the following particulars: 1st. It affects only the farinaceous part of the grain, and not its cover-

ings. 2d. Its granules are much larger, and of a less intense black colour. 3d. It possesses an extremely offensive odour. And, 4th, it is not dispersed before the harvest, but is reaped and carried with the sound corn. It is readily recognised in wheat by the grains being lighter, shorer, and rounder, than healthy corn, and by the dirty appearance of its integuments. Grains thus affected are easily crushed by the finger, have a greasy feel, and emit their peculiar odour when rubbed. No means of preventing its attack have hitherto been discovered; but its less frequent occurrence in wheat has been ascribed to the process of dressing to which that corn is subjected. Dressing consists in allowing the corn to macerate for some time in sea-water, or solutions of common salt or arsenic, &c. and then drying it by means of quick-lime. The advantages resulting from this treatment have been well illustrated by experiments, one of which Dr. Bossey related; but which of the processes used for the protection of the crops is most effectual, he could not take upon himself to say. Wheat, when thus diseased, is so altered in its sensible and physical properties, that it is not likely ever to have been used extensively as an article of food; but its occasional admixture with sound corn has afforded opportunity of observing its deleterious effects on man. Galen speaks of "*frumentum nigrum*" in connexion with lolium, and cautions against its use. Longolius saw a man who, having from curiosity devoured a few grains of carious wheat, was affected with pains in the limbs; and Tissot states that chronic diseases of the abdomen and skin occurred in 1758, from the bread of that year containing a portion of it. An interesting conversation ensued, in the course of which (embracing chiefly the average produce of corn, the proportion destroyed by uredos and insects, different soils, the process of dibbling, &c.) it was stated that many persons were affected, in 1814 and 1816, with what was commonly known as mildew mortification.—Adjourned.

## ZOOLOGICAL SOCIETY.

THE usual monthly meeting was held on Thursday afternoon, the Rev. John Barlow, F.R.S., in the chair.—Visitors to the gardens and museum, September and October, about 28,000. Stock at the gardens, 284 mammalia, 725 birds, and 23 reptiles; in all, 1032; being a dozen less than at last report. The secretary, in answer to Mr. Vigors, stated that the receipts at the present period of the year were less, by 3880*l.*, than they were this time last year; 10,081*l.* 12*s.* had been invested in the three per cents; the Society's liabilities were less this year by 1700*l.* than the usual average; so that, taking every thing into consideration, the real deficiency amounted only to about 600*l.* Two living hippopotami and several fine lions are expected shortly to be added to the menagerie. A number of individuals were elected into the Society.

## ELECTRICAL SOCIETY.

SATURDAY, Oct. 28.—Mr. Bachoffner read a paper "On the Electro-Magnetic Coil." The construction is simply a thick coil of wire, carrying the battery current, surrounded by a thin wire of 2000 feet, in which is set up the secondary current; that a current of this nature is for a time established in the thin wire by its proximity to the one carrying the battery current, is a fact no longer disputed; but whether such current is the result of induction, or whether it proceeds from the expansion and collapse of the magnetical lines, is a subject, the

author stated, for future experiments. The introduction of the coil into the circuit of a voltaic battery, capable of effecting the decomposition of water, Mr. Bachoffner found, diminished, and not, as it has been stated, increased, the amount afforded in a given time. The following experiment had been tried several times with similar results:—Four pots, sustaining batteries capable of holding half-a-pint of liquid each, gave one cubic inch of the mixed gases in two minutes and a half; but when the coil was introduced, the time occupied to obtain the same quantity was augmented to three minutes and a half. A like decrease of power was shewn with the battery on the table. Mr. Bachoffner stated his opinion, that no correct estimate of the action of the coil can be taken if an intensity arrangement be employed for that purpose. He then reversed the arrangement from intensity to one of quality, which he was enabled to do, by the ingenious contrivance of Mr. Clark, in a few seconds. The battery in that state was incapable of decomposing water; the introduction of the coil produced decomposition, or intensity effects; and these were considerably increased by intercepting the flow of the battery current, and again permitting it to take its course, or, as it is termed, making and breaking contact, not too rapidly. A bundle of wires, short pieces from eight to ten inches long, bound firmly together by an insulated wire of the same metal, inserted in the centre of the coil, increased the power twenty fold. The chemical effects likely to be produced by the action of the coil offer a wide field of research. The various contrivances to break and renew contact, viz. Ritchie's magnet, Barlow's spur wheel, Collen's electromagnetic repeater, as also Mr. Golden Bird's, submitted to a former meeting, were cursorily noticed: they all require mercury at the points where contact is broken; consequently, are subject to the combustion of that metal and the common inconveniences attendant upon its use. Mr. Bachoffner had substituted an apparatus with a spring and ratchet wheel, upon the well-known principle of the child's rattle. It dispensed with mercury, and, from its simple construction, is not liable to get out of order. It, however, requires turning, and does not perform its task silently; the latter inconvenience may be removed by filling up the vacant spaces of the wheel with pieces of ivory. The electric light given out from this apparatus, on breaking contact, is highly interesting. Several experiments were shewn with springs tipped with different metals. One fact connected with the platina spring is likewise interesting: the smell peculiar to dry frictional electricity is very palpable.

#### ROYAL GEOLOGICAL SOC. OF CORNWALL.

The council of the Royal Geological Society of Cornwall, in their twenty-fourth annual report, observe, that they feel called on to notice, before every other circumstance, the loss which the Society has sustained by the demise of its illustrious and royal patron, King William the Fourth, who graciously took it under his protection and patronage, and was pleased to bestow on it an annual donation of twenty pounds; and to record with grateful acknowledgment that her majesty the Queen Victoria has munificently signified her intention of continuing the same bountiful support. The report goes on to state that the labours of the Society during the past year have principally had reference to the organic remains which have been found in different parts of the county: for, although their existence in one or two insulated spots

was well known, no suspicion was entertained of their occurrence in so many localities and in such abundance. This year has also witnessed the completion of an object which was one of the chief desiderata at the institution of this Society. The valuable researches of many of its members, and of Dr. Boase in particular, had given a good general outline of the geology of Cornwall; and accurate details of many parts of it; but the labours of Mr. De la Beche, under the directions of the Board of Ordnance, have at length brought to perfection a geological map of the county, executed with the accuracy for which that eminent geologist is so distinguished. This, and a book of reference, are now in a forward state, and they are to appear early in the ensuing spring. Mr. Henwood's valuable survey of the mines is also completed. The donations to the museum have been of great value and importance.

#### LITERARY AND LEARNED.

October 30, 1837.

SIR,—Supposing that, as editor of a literary publication, you will not disdain the veriest scraps of notices connected with literary subjects, allow me to point out to you a laughable blunder, committed in the last-published part of the "Encyclopædia Metropolitana," and which well deserves a place in that system of domestic cookery, mentioned in your last, in which the curious receipt for making hell-broth may be found. (*Encyclopædia Metropolitana, Part XLVI., page 274, of the Lesicographical Division.*) "Salad,—Fr. *salade*; It. *insalata*; Sp. *ensalada*, quasi *salada*, salted; because eaten with salt; the Lat. *acetarium*, because eaten with vinegar (*acetum*)."

Judge, sir, what was my astonishment at finding the following, cited to illustrate the above.

"And thus, having so good a reason as this, to induce and draw us on, we may not stick to have pretious baulmes upon our heads, so it be under our *sallats* and *mourrons*."—*Holland, Phine, book xiii., chap. 3.*

Either Pliny, or Holland, or the encyclopædist, is here outdoing Hannibal with a vengeance. He, it is said, sopped the Alps with vinegar, but certainly without any intention of eating them; and who, I pray, would ever think of pickling a *sallet* or morion with salt and vinegar, unless it were to provide a dainty dish for an ostrich? Now, sir, you need not to be informed that this quotation ought to have appeared eight pages further on, in connexion with a word, which, although very like unto the above in sound, is very unlike in sense; viz. page 282. "*Sállad*, or *Sállat*.—Fr. *salade*, a helmet, or head-piece," &c., &c.

And here you will find a quotation from Shakespeare, in which mention is made of the word in both its senses, and, therefore, might have been cited by the encyclopædist, with equal propriety in both places.—*Vide Henry VI. Part 2d, Act iv. Scene 10. Iden's Garden.*

*Cade loquitur.*—"On a brick wall have I climbed into this garden; to see if I can eat grass, or pick a *sallet* another while, which is not amiss to cool a man's stomach this hot weather. And, I think, this word *sallet* was born to do me good; for, many a time, but for a *sallet*, my brain-pan had been cleft with a brown bill; and many a time when I have been dry and bravely marching, it hath served me instead of a quart pot to drink in; and now the word *sallet* must serve me to feed on."

But it may be objected, that, whereas *sallets* and morions were formed of various materials;

that they were made, not only of metals, but also of the skins of divers beasts; so, under the supposition that those in question were actually of the latter material, the encyclopædist might yet be justified in his quotation; for that an old leathern helmet, dressed with salt and vinegar, might afford an enviable meal to a soldier on short rations,—I must, therefore, refer you to Pliny himself for an answer to this objection. His words are:—"Ista patrocinia quarimus vitia, ut per hoc jus sumantur sub casside unguenta." And I believe it to be universally admitted, that, while *galea* is the term employed to designate a leathern helmet, so *cassis* is used to signify one constructed of materials certainly not more digestible than iron or brass.—I remain, &c. F. B.

P.S. Since writing the above, I have discovered that the same blunder has been made in the "New Dictionary of the English Language," by Charles Richardson. While I am on this subject, will you permit me to inquire whether you or any of your readers can help me to the meaning and etymology of the word *coresing*, which occurs in the passage below. I have a fancy of my own on the subject, but I feel so uncertain with regard to it, that I had rather seek for information from others than venture to broach my own opinion.

(*Three Primers put forth in the Reign of Henry VIII., reprinted at Oxford, 1834, and edited by Dr. Edward Burton, Regius Professor of Divinity, page 175.*) "Then they that were come thither with their master, considering what was like to fall, said to him, 'Master, shall we smite them with the sword?' for that, that their master had said before, as concerning the sword to be so necessary, that all their money, their meat, yea, their very coats, ought to be changed for swords, signifying the great power and violent hands of their enemies to come; they, like as yet carnal men, gathered of these his sayings, that they might slay, or use the sword. Wherefore even then said they, 'Master, lo, here are two swords.' But their master neither would, nor meant any such defence. Notwithstanding, yet, here at this time, before he could answer and shew them his mind, as touching this *coresing* of words for their other necessities, Peter Simon, which pretended to love his master more fervently than other, having then one of these two swords, had drawn it, and smote off the right ear of one called Malchus, the bishop's servant."

#### UNIVERSITY INTELLIGENCE.

OXFORD, October 28.—The following degrees were conferred:—

*Doctor in Divinity.*—Rev. T. V. Short, late Student of Christ Church, Rector of St. George's, Bloomsbury, and Deputy Clerk of the Closet to her Majesty, Grand Comptroller.

*Doctor in Civil Law.*—Rev. F. Gooch, Fellow of All Souls' College.

*Bachelor in Civil Law.*—J. Lane, Queen's College.

*Masters of Arts.*—Rev. H. Rogers, University College; H. Woolcombe, Rev. W. L. Hussey, R. R. Anstie, Students, Rev. W. G. L. Wasey, Rev. J. C. Barrett, Christ Church; Rev. W. Sinclair, St. Mary Hall; W. C. Le Breton, Fellow of Exeter College; Rev. J. Price, Jesus College; Rev. C. W. Landor, Worcester College; A. Entwistle, Fellow, Rev. S. R. Walker, Rev. A. W. Radcliffe, Brasenose College; G. A. Payne, Pembroke College; Rev. W. Brock, Queen's College.

*Bachelors of Arts.*—Sir R. H. Leigh, Bart., Grand Comptroller, J. C. B. Riddell, R. H. Pollen, Christ Church; T. Halliwell, New Inn Hall; E. Salmon, Exeter College; T. M. R. Barker, Oriel College; F. P. Voules, Wadham College, incorporated from Trinity College, Dublin.

CAMBRIDGE, October 25th.—The following degrees were conferred:—

*Bachelor in Divinity.*—The Rev. R. Parkinson, St. John's College, Fellow of the Collegiate Church of Manchester, and Hulsean Lecturer in this University.

*Bachelors of Arts.*—E. D. G. M. Kirwan, W. A. Carter, Fellows of King's College.

*Trinity College.*—The prize for the English Essay was

this year adjudged to J. A. Hardcastle; and the Latin Verse prizes to A. M. Hopper, and J. M. Neale.  
*Queen's College.*—The theological-dissertation prize was adjudged to W. R. Smith; the Latin declamation prizes to J. Thomas and F. Simpson; and the English Essay to W. Mathews.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

Tuesday.—Architectural Society (Conversazione).  
 Wednesday.—Medico-Botanical.

#### FINE ARTS.

##### ARTISTS' AND AMATEURS' CONVERSAZIONE.

THE first meeting of the above society took place on Wednesday last, at Freemasons' Tavern, and displayed a good assemblage of works of art and men of talent. Mr. Robert Graves exhibited his etching of Shakespeare's Trial, after Mr. G. Harvey, which he is now engraving for the Scottish Association. We also observed a pair of splendid etchings, from pictures by Robéot, of Paris, of Roman peasants; a beautiful etching, by Bromley, of the royal hounds; some pictures by Stanfield; and drawings by Pyne and others. Also, a fine picture by De Bree, of Henry IV. and the Duc de Sully in a nunnery.—Mr. Sams, the Egyptian traveller, who was present, exhibited various interesting articles from ancient Egypt, illustrative of the early art of engraving: among others, a remarkable necklace, of great beauty. It is composed of Oriental cornelian, chryso-prase, and gold, intermingled, and is supposed to have belonged to some princess of the time of the Pharaohs. Six of its pieces, longer than the others, bear inscriptions, evidently cut with the graving tool. There was also a remarkable lamp, having an inscription in Greek, in the uncial character; and, particularly, an extraordinary and magnificent royal signet, of solid gold, weighing nearly an ounce and a half. This beautiful object has the king's name, one of the most ancient Pharaohs, engraved upon it, as well as other inscriptions, all evidently cut with the graver. The form of the signet is simple, but curious: a large, massive, and accurately squared piece of gold is hung on a swivel, so that two sides bear inscriptions.

#### NEW PUBLICATIONS.

*Portrait of His Grace the Duke of Wellington, K.G. &c. &c., as Lord Warden of the Cinque Ports.* Painted for the Mayor and Corporation of Dover, by John Lilley, Esq.; engraved in mezzotinto by James Scott. Boys. In noticing the fine whole-length portrait of England's illustrious warrior and statesman, which was one of the most attractive features of the last exhibition of the Royal Academy, and from which the present print has been engraved, we said:—"The resemblance is excellent; and the depth and richness of the tones, and the general management of the effect, would do honour to the most experienced hand: yet we understand that Mr. Lilley has not yet attained the age of twenty-one." It appears that our opinion on this subject became so strongly that of the public, as to call for two prints—one a whole length (now in the course of execution), the other the half length before us, exactly corresponding in size to the portrait of Sir Robert Peel, engraved by Mr. Turner from Sir Thomas Lawrence's picture. Mr. Scott has acquitted himself with great ability; and has been remarkably successful in preserving that most difficult achievement of a portrait-painter's pencil, the characteristic expression by which the original picture is distinguished. The print is dedicated, by special permission, to her majesty.

*Heath's Picturesque Annual, 1838: Ireland.*  
 Illustrated by T. Creswick, and D. MacIse, A.R.A. McCormick.

HOWEVER little the text of this annual may justify the title of "picturesque," the illustrations fully support its claim to that appellation. As was the case last year, the great majority of them are from the pencil of Mr. Creswick. Mr. MacIse has furnished only three; viz. "A Lady at Prayers," "The Irish Market Girl," and "The Irish Jig." The last is especially spirited and characteristic. The number of Mr. Creswick's contributions is sixteen. We need not add, that they are all exceedingly beautiful. No artist knows how to arrange designs in a vignette form better than Mr. Creswick. He "focuses" (as our able friend Burnet would call it) the light and shade with singular skill. Of this quality, "Waterloo Bridge, Cork," "The Gap of Dunloe," "McGillicuddy's Reeks, and the Upper Lake of Killarney," "Fair Head," "Carrickfergus Castle," "Comme Dhur (The Black Valley)," and "Donegal Castle," are fine specimens.

*Memorials of Cambridge. A Series of Views of the Colleges, Halls, Churches, and other Public Buildings of the University and Town of Cambridge.* Engraved by J. Le Keux, from Original Drawings, made expressly for the Work: with Historical and Descriptive Accounts of the Buildings, &c. by Thomas Wright, M.A. of Trinity College, Cambridge.—No. 1. London, 1837. Tilt; Cambridge, J. and J. Deighton, and T. Stevenson; Oxford, J. H. Parker.

THE success which has attended the publication of the "Memorials of Oxford," has encouraged the proprietor of the publication under our notice, to commence a similar undertaking with reference to Cambridge. "He is convinced," he observes, "that it yields not to its sister University, either in beautiful subjects for the pencil and the graver, afforded by its public buildings, and by the scenery which immediately surrounds it; in interesting relics of past ages; in matters of historical interest and importance; or in the number of great and distinguished men who have been formed within its precincts." The subject of the first number is Trinity College. Besides wood engravings of the "Cycloidal Bridge," and of the "Statue of Edward III. on Gateway Tower," there are views of the "Library," and of the "Great Court," executed in the same style of clearness and beauty that so frequently elicited our commendations of the "Memorials of Oxford," to which Work, we have no doubt, the *Memorials of Cambridge* will form a very worthy companion. The high reputation and talents of the author are a sufficient pledge that the historical and descriptive matter will be of sterling character and value.

#### ORIGINAL POETRY.

\* \* \* When we introduced some poetry under the signature of E. C. (See *Literary Gazette*, No. 1677), we were not aware who our anonymous correspondent was; but have now the pleasure of paying the compliment to the name and sex of our fair contributor, Miss Eliza Cook, a name which will not be forgotten, if continued to be attached to such various and beautiful compositions.

#### THE DEWDROP.

THE sky hath its star, the deep mine hath its gem,  
 And the beautiful pearl lights the sea;  
 But the surface of earth holds a rival for them,  
 And a lustre more brilliant for me.

\* See the *Literary Notice* of this publication, in our No. 1063.

I know of a drop where the diamond now shines;  
 Now the blue of the sapphire it gives:  
 It trembles—it changes—the azure resigns,  
 And the tint of the ruby now lives.

Among the deep emerald dwells in its gleam  
 Till the breath of the south wind goes by,  
 When it quivers again, and the flash of its beam,  
 Pours the topaz flame swift on the eye.

Look, look on the grass-blade all freshly im-  
 pearl'd,

There are all of your jewels in one;  
 You may find every wealth-purchased gem in  
 the world,

In the dewdrop that's kiss'd by the sun.

Apollo's own circlet is matchless, they say;  
 Juno envies its sparkles and light;  
 For 'tis form'd of drops lit by his own burning  
 ray,

And Olympus shews nothing so bright.

ELIZA COOK.

#### THE SMUGGLER BOY.

WE stole away at the fall of night,  
 When the red round moon was deep'ning her  
 light,

But none knew whither our footsteps bent,  
 Nor how those stealthy hours were spent;  
 For we crept away to the rocky bay,  
 Where the cave and craft of a fierce band lay;  
 We gave the signal cry, "Ahoy!"  
 And found a mate in the smuggler boy.

His laugh was deep, his speech was bold,  
 And we lov'd the fearful tales he told  
 Of the perils he met in his father's bark,  
 Of the chase by day and the storm by dark;  
 We got him to take the light boat out,  
 And gaily and freshly we dash'd about,  
 And naught of pleasure could ever decoy  
 From the moonlight sail with the smuggler boy.

We caught his spirit and learnt to love  
 The cageless eagle more than the dove;  
 And wild and happy souls were we,  
 Roving with him by the heaving sea:  
 He whisper'd the midnight work they did,  
 And shew'd us where the kegs were hid,  
 All secrets were ours—a word might destroy,—  
 But we never betray'd the smuggler boy.

We sadly left him, bound to range  
 A distant path of care and change;  
 We have sought him again, but none could  
 relate

The place of his home, or a word of his fate;  
 Long years have sped, but we dream of him  
 now,  
 With the red cap toss'd on his dauntless brow;  
 And the world hath never given a joy  
 Like the moonlight sail with the smuggler boy.

ELIZA COOK.

#### THE WATCH OF DEATH.

THE last low murmur of the chimes of night,  
 Boom'd from the rustic village spire. Beside  
 A sick man's couch, with looks which could  
 not hide

Affection's fears, a maiden watch'd. The light  
 From her dim lamp fell on her face, like blight  
 On some fair flower. Fond girl! she seem'd  
 to chide [aside]

Her own low sighs: her eyes ne'er turn'd  
 From the poor sufferer; lest to realms more  
 bright

His soul should wing. The room was still.  
 He slept.

His bony hands lay motionless and cold;  
 His livid cheek, down which a tear still crept,  
 Press'd the white pillow; there was naught that  
 told

He lived; yet she sat list'ning for his breath—  
An angel watching o'er the sleep of death!  
TENNANT LACHLAN.

### SKETCHES.

*Streetology, No. V.*—As is our custom, we noticed the *début* of this publication, though addressed to the lowly subject of street beggars and itinerants; and as is also our custom, we have abstained from any further remarks on its contemporary progress. Our principle is, that as we cannot praise all, we have small right to impede or injure by censure, works either in the same, or in something like the same line with our own; and therefore it is best, according to the old saw, to let every herring hang by its own head. But we have not on these grounds felt ourselves precluded from an occasional notice of any insulated matter which might occur to us, and in this spirit we insert the following curious quotation from the slight production which we have named. It concludes the biography of a singular match-vender, and might be treasured among the archives of the Statistical Society as part and portion of the statistics of London. "With respect, then, to match-venders, or Streetological 'timber merchants,' there are, including men, women, and children, about seven hundred who are to be found in and about the metropolis, some carrying a few old-fashioned bundles in their hands, going from door to door, knocking or looking down into the area windows, and forcing a sale of their timber splinters, with the inquiring cry of 'Please do you want any matches? pray do take a hap'orth of a poor woman, with a large family of small children. God bless you, mar'm, thank you.' Some of them carry a basket with a few laces, threads, needles, &c.; and occasionally in addition to the match business, some of the old women carry a pack of cards, which frequently enables them, if once they catch hold of an unwary servant, and obtain admission to the kitchen, to draw a shilling or two for a 'lay-out,' and a little fortune-telling. \* \* \* Men and women respectably dressed may be seen standing in the obscure streets, at a distance from the glare of the gas-light, with a basket or clean cloth, containing a few bunches of matches: these are the newly initiated beggars, who carry a few bundles of matches, merely to avoid being taken by the officers of the Mendicity Society. The principal markets and avenues leading thereto, are studded with itinerant timber merchants. There is one more class, that may be termed the wholesale retailers, being in number about fifteen or twenty; they live by supplying the ship-chandlers in Thames Street, Wapping, Limehouse, Blackwall, Greenwich, Woolwich, Gravesend, and other water-side localities, and are seldom found exercising their callings in the street. The itinerant match-venders dispose of about ten shillings' worth per week each upon the average; the timber costing them about eight pence, and the brimstone threepence—say one shilling in all, thus then they have for labour of cutting and selling, nine shillings. Admitting that they are sold in half-penny worths, although many persons take two or three pennyworth at a time, while others only purchase a farthing's worth, each vender will supply 240 families, and the whole match-making fraternity will, consequently, supply 148,000 families weekly, and receive in the aggregate for that apparently useless and inconsiderable domestic article—a brimstone-dipped stick, the immense sum of 350l. It is estimated that in London and its environs, not

less than 1000 fathoms of wood are annually cut up for matches, and about three tons of brimstone consumed in dipping them. This estimate includes the marine consumption; and although match-making may be made light of, it will be seen from Dick Tynt's authority, that it is a very important and weighty matter, and one that certainly supplies bread to a great number of unfortunates, and is of vast consideration to every one who keeps a tinder-box, and eschews lucifers."

### MUSIC.

'Twas the Day of the Feast, a Historic Ballad.  
Written and composed by Samuel Lover,  
Esq. Duff and Co.

THE affecting circumstance on which the poet has seized with so true a spirit of grateful patriotism and loyalty, must be in the memory of our readers. Lord Munster, by the act of filial piety this verse enshrines, imparted the last earthly solace to the fainting soul of our lamented king: the melody is beautiful, and, in our opinion, not unworthy of the occasion.

"The last annual tribute of the flag of Waterloo to the crown of England was made to William the Fourth a few hours before his Majesty's lamented death; on receiving the banner, the king pressed it to his heart, saying 'It was a glorious day for England,' and expressed a wish he might survive the day, that the Duke of Wellington's commemoration of the victory of Waterloo might take place. A dying Monarch receiving the banner commemorative of a National Conquest, and wishing at the same time, that his death might not disturb the triumphal banquet, is at once so heroic and poetic, that it naturally suggests a poem. The following lines were written immediately after the event, but the publication of the song has been delayed through a feeling of respect; the laurel should not be placed too close to the cypress, nor the sound of the lyre be heard too near the grave of a king.

'Twas the day of the feast in the chieftain's hall,  
'Twas the day he had seen the foe-man fall,  
'Twas the day that his country's valour stood  
'Gainst steel, and fire, and the tide of blood.  
And the day was mark'd by his country well,  
For they gave him broad valleys, the hill and the dell,  
And they ask'd as a tribute, the hero should bring  
The flag of the foe to the foot of the king.

'Twas the day of the feast in the chieftain's hall,  
And the banner was brought at the chieftain's call,  
And he went in his glory the tribute to bring,  
And lay at the foot of the brave old king;  
But the hall of the king was in silence and grief,  
And smiles, as of old, did not greet the chief,  
For he came on the Angel of Victory's wing,  
While the Angel of Death was awaiting the king.

The chieftain he knelt by the couch of the king;  
'I know,' said the monarch, 'the tribute you bring;  
Give me the banner ere life depart!  
And he press'd the flag to his fainting heart.  
'It is joy ev'n in death,' cried the monarch, 'to say  
'That my country hath known such a glorious day!  
Heaven grant I may live 'till the midnight's fall,  
That my chieftain may feast in his warrior hall!'

### DRAMA.

*Drury Lane.*—On Saturday was produced the *Indian Girl*; a piece of mingled dialogue and stage action, or dumb-show; in which, of course, Celeste sustained the principal part—that of an English girl, the daughter of one of our regicides, carried off by the Indians, and made the wife of a red chief. She is retaken; and her recognition of her family, almost obliterated from her memory by ten years of savage life, affords fair scope for her powers, and all the rolling artillery of a pair of large French eyes. Her child is made an instrument, and too frequently, to affect her mind and passions; for, in such cases, the morning gun ought not to be too often repeated. M'Tan, as the Indian warrior, is very calm and characteristic; and the fatal catastrophe forms a striking tableau: but the whole is far too long for the material, and there is not interest enough to carry out a sixth portion of the time and grimace.

*St James's Theatre.*—The *Cabinet*, revived in force, with Braham in full song, has been the great attraction here since our last.

*Adelphi.*—On Monday, a most gorgeous melodrama, worthy of the highest scenic efforts

of this theatre, was produced. It is entitled, *Valsha, the Slave Queen*, and founded on a Bohemian tradition. The costumes, the pageantry, and the scenery, are splendid; and it is quite wonderful to see so much of striking beauty and interest effected on any stage, and still more on one of the *Adelphi* limits. The finale is fearfully fine and impressive. Mrs. Yates performed *Valsha* in her most touching and finished style; and O. Smith, a stubborn ruffian, with some few touches of nature, admirably. The whole is got up in a manner which reflects the utmost credit on the management for spirit and profuse expenditure; and, as we anticipate a long and prosperous run for the *Slave Queen*, we rejoice to be able to say, that, with all the strong features of the French stage, this drama is not only altogether free from the stain of immorality, but, in truth, the plot, from first to last, is well devised to point a moral. The adaptor is, we believe, Mr. Coyne; and the success of his work is quite uproarious and triumphant.

*The Opera Buffa.*—We are glad to find that the *Opera Buffa* is about to re-open for another season at the Lyceum, and with such a programme as bids fair to make it all the public could desire. An opera of Mozart's is intended for performance once in every week. Cinti Damareau will join if she can obtain the needful leave; and, already, with the exception of Mademoiselle Scheroni, the young and pretty, who is announced for December, a host of talent has congregated in London. A great variety of excellent operas, some of them new to us, are, we see with pleasure, in the bill of fare.

### VARIETIES.

*Ornithological Society.*—It is out of its regular place, but we have merely to state that the Ornithological Society met yesterday; when Messrs. Blyth, Macleay, and Vigors (the latter in the chair), made some interesting remarks on various peculiarities in birds, the egret in owls, the bill in hornbills, &c. &c.

*La Mosaïque.*—A French weekly publication, No. 1., has joined our periodical ranks; and we hail it with pleasure, for it is very various, very meritorious, and offers a most agreeable vehicle for familiarising readers with the language.

*Weather Wisdom.*—This is an important week, for Thursday is the Lord Mayor's Day, and the Queen is going to feast with the city. What says our oracle? "Cold air on the 4th—a fall of snow. The sextile of the Sun to Jupiter on the 6th will mitigate the cold; but Saturn near at hand, may cause snow. The influences are of a windy nature about the 8th, with many changes—dark and gloomy weather." Painful uncertainty! The ninth is in doubt. May it be sunny as the occasion!

*H. B.s.*—As politics begin to resume their season, H. B., of course, becomes more fertile. We have this week two novelties (Nos. 504, 5), in which the same characters figure, viz. the Queen and Lords Melbourne and Palmerston. In the first they appear on horseback, as Sannah and the Elders; and in the last, as *Kitty* and two of the livery in *High Life below Stairs*, but inverted as lately performed at Windsor, when the sheriffs' livery suits were exhibited to royalty. The likenesses are very good, but there is not much satire in these sketches. The first is the best.

*The late Dr. Valpy.*—We are informed that the subscription for a monument to the memory of the late Dr. Valpy, for upwards of fifty years head master of Reading school, is filling

up in a very gratifying manner, and that the list contains many distinguished names of gentlemen educated at that seminary.

**Meteors.**—We need hardly remind our astronomical readers, that the return of periodical meteors assigned to the 13th of November, or thereabouts, will soon require their watchful observation. Electrical experiments may also be made with advantage at this period.

**Fine Arts: Newcastle.**—A Society for the Promotion of the Fine Arts has been formed at Newcastle, under the presidency of the Bishop of Durham, and patronised by many resident men of rank and influence.

**Encouragement of Art in France.**—Mr. Horace Vernet has been appointed by the king to paint a picture of the taking of Constantine; and set out to Africa on this mission. Thus are the fine arts and national feelings cultivated at the same time by a judicious government.

*To a Lady who is said strikingly to resemble Chalon's Portrait of the Queen in her Robes and Jewels.*

Who likens thee to Briton's queen,  
Not far from truth departs;  
For she's the queen of diamonds,  
And thou a queen of hearts. H.

### LITERARY NOVELTIES.

#### LIST OF NEW BOOKS.

Eminent Literary and Scientific Men of Italy, Spain, and Portugal, Vol. III. (forming Vol. XCVI. of Dr. Lardner's Cabinet Cyclopædia), fcap 8vo. 6s. — Hints to Mothers during the Period of Pregnancy, by T. Bull, M.D. fcap. 5s. — *Icones Plantarum*; or, Figures, with Description, of New and Rare Plants, by Sir W. J. Hooker, Part IV. (completing the work), 8vo. 14s. — A Curate's Views of Church Reform, by the Rev. J. Jordan, B.A. 8vo. 3s. 6d. — *Chelsea Hospital, and its Traditions*, by the Author of "The Subaltern," &c. 3 vols. post 8vo. 12s. 6d. — *The Veteran*; or, Forty Years in the British Service, by Capt. J. Harley, 2 vols. post 8vo. 21s. — *Classification of the Insane*, by M. Allen, M.D. 8vo. 6s. — *The Naval Keel*, for 1838, containing a new Life of Nelson, by the "Old Sailor," fcap. 7s. 6d. — *Prayers for Young Persons*, fcap. 2s. — *Management of the Organs of Digestion*, by R. Mayo, F.R.S. post 8vo. 6s. 6d. — *The Apprentice's Pocket Guide to Wealth and Esteem*, 32mo. 1s. 6d. — *Literary Varieties*, by Wm. Mackenzie, 12mo. 5s. — *Live and Let Live*, by Miss Sedgwick, 18mo. 2s. 6d. — *The Excitement for 1838*, edited by the Rev. R. Jamieson, 18mo. 4s. 6d. — *The Sunday-School Teacher*, by J. ### METEOROLOGICAL JOURNAL, 1837.

	Thermometer.	Barometer.
Thursday ... 36	From 29 to 54	29.95 to 29.80
Friday ... 37	..... 29 to 53	..... 29.50 to 29.58
Saturday ... 28	..... 35 to 51	..... 29.60 to 29.38
Sunday ... 29	..... 33 to 47	..... 29.38 to 29.40
Monday ... 30	..... 34 to 47	..... 29.35 to 29.26
Tuesday ... 31	..... 40 to 59	..... 29.31 to 29.43

Wednesday 1  
Wind, S.W.

Except the 31st ult., generally cloudy, with frequent and heavy showers of rain; wind very boisterous during the afternoon of the 1st instant.

Rain fallen, 1.075 Inch.

Edmonty.

CHARLES HENRY ADAMS.

*Extracts from a Meteorological Register kept at High Wycombe, Bucks, by a Member of the Meteorological Society, September 1837.*

Thermometer—Highest.....	69.25 .. the 21st.
Lowest .....	53.50 .. 26th.
Mean .....	53.4516
Barometer—Highest.....	30.08 .. 25th.
Lowest .....	29.83 .. 13th.
Mean .....	29.93388

Number of days of rain, 11.

Quantity of rain, in inches and decimals, 1.61875.

Winds.—4 North-East—6 East—3 South-East—4 South—3 South-West—4 West—3 North-West—3 North.

*General Observations.*—The temperature of the month was lower than since September 1835, as respects the mean and maximum, although the minimum in 1834 was half a degree lower. The barometer was higher than in 1835 and in 1836; and only once, in the last fourteen years, has so little rain fallen in September—viz. in 1833, from the 18th to the end of the month, no rain fell, and the weather was very fine.

### TO CORRESPONDENTS.

A. E. H. is advised that *various* and *one* cannot pass as rhyme, though the ideas are poetical enough.

✦ reads roughly, and the story is very familiar to readers.

We have used all we can of R. E. L.'s tableaux.

### ADVERTISEMENTS,

Connected with Literature and the Arts.

TO ARTISTS, TOURISTS, AND ADMIRERS OF THE FINE ARTS.

**PARLOUR'S PORTABLE SKETCHING-CASE, or DELINEATOR**, is confidently recommended to the notice of all persons attached to the Science of Drawing, as being initially superior to the Camera Lucida, and all other instruments hitherto invented, for the purpose of Sketching. The Sketching-Case may be held in the hand, and a correct Drawing made of any object or landscape; or it may be attached to a table, in the same manner as the Camera Lucida. It is simple in its management, and does not exceed, in size, the common Sketching-Book. Manufactured for the Patentee, by Reeves and Sons, 150 Cheapside; may be had, also, of Smith and Warner, Marylebone Street, Piccadilly; Watkins and Hill, Opticians, Charing Cross; and at all other Opticians' and Artists' Repositories. Ladies and Gentlemen who have the Camera Lucida may have the Delineator affixed to their own stem.

**COLLEGIATE SCHOOL** (formerly Dr. Bred's), Haverhill, Middlesex. Principal, the Rev. J. A. Kimerton, M.A., Oxon. The Term divides on Thursday, the 9th of November. Further particulars may be had on application (if by letter, post-paid) to the Rev. T. T. Walmsey, D.D., Rectory, Haverhill; J. D. Macbride, Esq., D.C.L., Principal of Magdalen Hall, Oxford; B. A. Kent, Esq., M.D., 80 Harley Street, Cavendish Square; and of the Principal, at the School.

**TO COUNTRY BOOKSELLERS.**  
A very Neat and Elegant Case, to hold Tilt's "Miniature Classics" on the Shop Counter, the Shelf, or the Window, has been prepared, price only 5s. It may be had on application through any London Correspondent. The Classics are now kept beautifully bound in Morocco, at exceedingly low prices.  
88 Fleet Street, Nov. 3d.

**THE THIRD ANNUAL REPORT of the POOR-LAW COMMISSIONERS for ENGLAND and WALES,** together with Appendices A, B, and C.  
London: Charles Knight and Co. 25 Ludgate Street, Publishers to the Poor-law Commissioners.

In 1 handsome 8vo. volume, with Two Plates of Facsimiles of Autographs of Eminent Kentish Writers, price 14s.; large paper, 18s.

**BIBLIOTHECA CANTIANA;** a Bibliographical Account of what has been published on the History, Topography, Antiquities, Customs, and Family Genealogy of the County of Kent, with Biographical Notes.  
By JOHN RUSSELL SMITH.

At the same time is published, and may be had gratis, **A Catalogue of a Valuable and Interesting Collection of Books relating to the County of Kent,** comprising Copies of Lambard's *Perambulation*, Harris's *Seymour*, Hasted's *History of the County of Kent*, Lewis's *Isle of Thanet*, Jacob's *Charter of the Cinque Ports*, Southey's *Lewis*, and Jacob's *Pavement*; Boy's *Handbook*; Lyon's *Dover*; Parson's *Monuments in Kent*; Cosen's *Tour in the Isle of Thanet*; Hasted, Sommer, Dart, and Gostling's *Canterbury*; Berry's *Kentish Genealogies*; Thorpe's *Registrum and Customs*; Roffe's *Battle of the Richborough and Reculver*; besides many curious and rare works on the Civil War, and Provincial Histories of the County, amounting to more than 700 volumes; also some curious Manuscripts and Autograph Letters. In fact, such an extraordinary collection for the country was never before offered for sale; each article is marked separately, at a very low price.  
London: John Russell Smith, 4 Old Compton Street, Soho; and may be had of all Booksellers.

18mo. 2s. and interleaved, 4s.  
**EXAMINATION PAPERS, for the Use of Theological Students, on the Facts of the Old and New Testaments; the Doctrines and Evidences of Christianity; the History of the Church; Liturgies, Translations of the Bible, &c.**

By the Author of "Questions on Adam's Roman Antiquities." I tasked myself, and I asked myself, And myself replied to me.  
Oxford: Henry Slatter; Longman and Co., Whittaker and Co. London; T. Stevenson, Cambridge.

Of whom, also, may be had, II.

**A Manual of the Sects and Heresies of the Early Christian Church; and brief Biographical Notices of the Principal Writers and Divines; with an Appendix, containing an Account of the most remarkable Modern Sects, and a Chronological Table.** By the Author of "Questions on Adam's Roman Antiquities," &c. &c. 2s. interleaved, 4s.

III.  
**Questions on Adams' Roman Antiquities.** Printed uniformly, and forming a useful appendage to that work. Second Edition. Demy 8vo. 6s. interleaved, 7s. 6d.

IV.  
**An Introduction to the Study of Ancient Geography,** with copious Indexes. By Peter Edmund Laurent, Author of a "New Translation of Herodotus," "The Odes of Pindar in English Prose," &c. Second Edition. To which is added, a Series of Questions adapted to this Work. Demy 8vo. 14s.

"We have not met with a work of more value to the classical reader, than this laborious and very useful volume. The indexes alone are worth half a historical series, as guides to references in esteemed authors; and on every point connected with ancient geography that can interest the scholar or general reader. Brief sketches illustrate these subjects, and, being well arranged, are capable of giving more information in an hour, than even the research would be likely to supply in several days. Upon these grounds it is not to be declared in spite of a few foreign idioms which are distinguishable in the author's language that a companion to the library more useful than Mr. Laurent's 'Introduction,' can nowhere be found. A word of further praise is not necessary, when we add, that upwards of nine thousand places are designated or described in this single volume."—*Literary Gazette*.

Price 4s. 6d.  
**THE ANATOMIST'S INSTRUCTOR,** and Museum Companion; being Practical Directions for the Formation and subsequent Management of Anatomical Museums. By P. J. KNOX, Surgeon, Conservator of the Museum, in Old Surgeons' Hall.

"We think this a capital work in its way. We positively insist upon surgeons and students buying it directly."—*Med.-Chir. Review*.

"An exceedingly useful book for pathologists, and those forming museums."—*London Medical and Surgical Journal*.

"We are very much pleased with this little work; it is written in a light easy style, conveying, nevertheless, a great quantity of information interesting to every member of the profession."—*London Medical Gazette*.

A. and C. Black, Edinburgh; Longman and Co. London.

The Monthly Magazine for November will contain **THE Life, Writings, and Travels of Confucius,** with an Account of the Worship offered to him. Illustrated by two Engravings. By Mr. F. P. THOMS (many years resident in China), also,

— 3. The Lydia. 3s. 6d. cloth.

London: George Virtue, 25 Ivy Lane; and all Booksellers.

MR. COLBURN, OF GREAT MARLBOROUGH STREET,  
HAS JUST PUBLISHED THE FOLLOWING NEW WORKS.

## THE BENCH AND THE BAR.

By the Author of "Random Recollections of the Lords and Commons," "The Great Metropolis," &c. 2 vols. post 8vo.

## PASCAL BRUNO;

A SICILIAN STORY. Edited by THEODORE HOOK, Esq. 1 vol. post 8vo.

"Mr. Hook deserves the thanks of all readers of romance for introducing to the English public this capital tale of surprise and adventure."—*Athenæum*.

### STORIES OF SPANISH LIFE.

Edited by Lieut.-Col. CRAUFURD, Grenadier Guards. 2 vols. post 8vo.

"These volumes are a welcome and valuable addition to English Literature, giving by far the best view of Spanish Life we have yet met with. The peculiarities of the Spanish character, its vices and its virtues, its object superstition, its wild revenge, are all drawn with vivid and startling effect."—*Spectator*.

### A GUIDE TO THE SPAS OF GERMANY.

By Dr. GRANVILLE,

Author of "Travels to St. Petersburg," &c. 2 vols. 8vo. with 38 Illustrations.

"This work furnishes the best and most authentic accounts of the different spas of Germany—of the daily course of life pursued there—of the character of their mineral springs—of the company to be met with at their tables-d'hôte—of the scenery that surrounds them—of the expenses consequent upon a residence among them—in short, of every thing that it is necessary for the tourist or the invalid to know about them. The volumes are embellished with numerous illustrations, executed in a very superior manner."—*Sun*.

### TRAVELS IN CIRCASSIA, KRIM TARTARY, &c.

In 1836-7, including a Steam Voyage down the Danube, from Vienna to Constantinople, and round the Coast of the Black Sea.

By EDMUND SPENCER, Esq.

In 2 vols. 8vo. with new Map of the Black Sea, and numerous Illustrations. "Mr. Spencer has had the singular advantage, in these days of enterprise, of being the first Englishman to break ground in a fresh and most interesting region. A singular and beautiful country—a noble and brave people—with their customs, character, social condition, and manners, are now for the first time fairly presented to Europe."—*Tell's Magazine*.

### THE PEERESS; or, the DAYS of FOX.

Edited by LADY CHARLOTTE BURY. 2d edition, 3 vols.

"An extraordinarily clever book."—*Dispatch*.

"A work of the greatest interest and power."—*Glasgow Courier*.

"A most fascinating story."—*Scotman*.

"An eminently entertaining work."—*Warder*.

"A work of great talent and originality."—*Edin. Evening Courant*.

## THE LIFE OF SIR EDWARD COKE,

Lord Chief-Justice in the Reign of James I. With Memoirs of his Contemporaries.

By C. W. JOHNSON, Esq. Barrister-at-Law. In 2 vols. 8vo. with Portrait.

"This is a very valuable work, illustrating one of the most important periods in our history, and written in a candid spirit, whose judgment is based on materials collected with great industry. A work, not merely valuable to members of the profession, but interesting and amusing to the general reader."—*Athenæum*.

## MISS LANDON'S NEW NOVEL. ETHEL CHURCHILL;

OR, THE TWO BRIDES. A Story of the Reign of George II. In 3 vols. post 8vo.

"Such a record of female sentiment and passion, as has hardly been published since the days of 'Corinna.' 'Ethel Churchill' abounds in brilliant thoughts and fine poetry, acute wit and observation, which, for its depth and feeling, is quite unwomanlike."—*Times*.

### UNCLE HORACE.

By the Authoress of "Sketches of Irish Character," "The Buccaneer," &c. In 3 vols. post 8vo.

"Mrs. Hall's new and delightful novel more than sustains the high reputation of its popular writer. Its bachelor hero, Uncle Horace, is a capital and original sketch—more truly and emphatically English than any character of the kind we are acquainted with. This delightful work deserves to attain a popularity not surpassed by that of any female writer of the day."—*Globe*.

### CAPTAIN MARRYAT'S NEW NOVEL.

SNARLEY YOW; or, the DOG FIEND.

Second edition, in 3 vols. post 8vo.

"This is a work in a completely new style, and full of spirit it is. The dash of historic character gives great effect to the wild and animated narrative."—*Lit. Gazette*.

### THE HUSSAR.

By the Author of "The Subaltern," "The Chelsea Pensioners," &c.

2d edition, in 3 vols. post 8vo.

"This work possesses a charm of no common description, and few will rise from its perusal without feelings of the highest gratification. A more exciting work has not appeared for a long time."—*Court Journal*.

### HORACE WALPOLE'S CORRESPONDENCE WITH GEORGE MONTAGU, Esq. &c.

During a Period of 65 Years.

A COMPANION TO WALPOLE'S LETTERS TO HORACE MANN. In 3 vols. 8vo. 36s. with numerous curious illustrative Notes, now first added, and a Portrait of Walpole.

### HUMAN LIFE.

By the Author of "Tremaine," and "De Vere." 2d edition, 3 vols.

JUST READY.

## A YEAR IN SOUTH AMERICA.

Comprising a Journey to the River Plata, across the Pampas and the Andes, to Chili, Peru, the Isthmus of Panama, and return Home by the West Indies, &c.

By the Hon. P. CAMPBELL SCARLETT. 2 vols. with Illustrations.

## JANE LOMAX;

Or, CRIME AND ITS CONSEQUENCES. By the Author of "Brambletye House," "Reuben Apsley," &c. In 3 vols. post 8vo.

MARY RAYMOND; and other Nouvelettes.

By Mrs. CHARLES GORE, Authoress of "Mothers and Daughters," &c. 3 vols.

### MEN OF CHARACTER.

By DOUGLAS JERROLD, Esq.

3 vols., with 12 humorous Illustrations after Thackeray.

HENRY COLBURN, PUBLISHER, 13 GREAT MARLBOROUGH STREET.

# THE LITERARY GAZETTE; AND Journal of Belles Lettres, Arts, Sciences, &c.

No. 1086.

LONDON, SATURDAY, NOVEMBER 11, 1837.

PRICE 8d.  
Stamped Edition, 9d.

## REVIEW OF NEW BOOKS.

*A Home Tour through various Parts of the United Kingdom: being a Continuation of the "Home Tour through the Manufacturing Districts." Also, Memoirs of an Assistant Commissary-General.* By Sir George Head, author of "Forest Scenes and Incidents in the Wilds of North America." 8vo. pp. 351. London, 1837. Murray.

BEFORE we speak of this volume, we may notice a circumstance relating to its predecessor, which, if not owing to its being out of print,\* is rather a curious illustration of the publishing trade. During a recent tour in the manufacturing districts (begun from the north), we were desirous of procuring Sir George Head's work as a guide to objects worthy of inspection; yet, strange to say, from Glasgow to Birmingham we could not find a single copy, and had not time to send to London for one. Now, had this been a trashy or catchpenny thing, puffed, placarded, and left in the shops on commission for sale or return, as it is called, there is no doubt but that we might have got it every where: being a *bonâ fide* really useful book, it was not on a shelf even in the largest manufacturing towns. What is the conclusion? Publishing is in a most unhealthy state; and the tone taken from the metropolis destroys character and utility throughout the provinces! But, to our present purpose.

This volume is a continuation of clever and lively sketches. No writer invests trivial matters with more amusing qualities than Sir George Head. Vivacity is his element; and from the tumble of a squab gull to the midnight embarkation in a steamer, nothing comes amiss to his fanciful and descriptive humour. The slight touches of this sort scattered over these pages, are almost inseparable from them; but we extract two as samples. First, of an unaccustomed male nurse carrying a child. On leaving a vessel with a cargo of passengers, he says, "I attached my fortunes on the way to a married couple, travelling *en suite* with all their encumbrances, that is to say, two nursery maids, and four or five young children. Of these I carried one, a little creature of two years old, in my arms; a short period of time and distance, one would think hardly worthy of being considered. Nevertheless, during the aforesaid space of a mile and a half, I found my right arm, from the want of usage in the office, ache most grievously. Meanwhile the infant, lost in the placid intensity of sleep, appeared to me to gain every five minutes successively a year's growth in weight."

Again, the portrait of a president, one worthy to be so, at a *table d'hôte* in Guernsey:—

"His countenance, it is true, reflected none of his thoughts, even if ever he had any, yet his was a broad, brown, happy face, and remarkably small and twinkling was his black eye. Though the party were chiefly young men, inclined, for the most part, to yield their opinions and gastronomic tastes altogether to his guidance, not a word did he find it necessary to say in the course of his duty, nor ever detain the bottle for a moment in his grasp: an

intelligent wink was usually sufficient to push it forward in its orbit; and even in extreme cases of inattention to the ceremony, a gentle elevation of the right elbow, or a nod to the left hand sidewise over his shoulder, never failed to produce the proper effect. Whenever he lifted to his mouth the glass, which he filled regularly to the brim at every solatice of the bottle, the rosy draught rolled over his projected under lip, down his throat in a continuous unbroken stream, swallowed apparently without the slightest muscular effort, while his russet cheeks beamed with reflected light, marking its progress like the sun's rays at setting, and indicating a genial warmth towards the centre of the system."

Having given these brief specimens, we have now to notice that the earlier part of the *Tour* relates to the Isle of Man, which Sir George Head traversed in every direction, and of which the following may convey some idea:—

"At daybreak in the morning I walked down to the bay, where I was speedily joined by the owner of a boat with whom I had previously made arrangements, and his two assistants. As we approached the skiff, which lay moored to the rocks, we were surrounded by numerous gulls that hovered close above our heads, all of which were so tame, that, being on the ground, and walking about at their leisure on the sea-shore, they took little notice as we passed, but flapping their wings gently, either in compliment to us, or to recreate themselves, merely made believe to rise. Protected by the fishermen, the law of the land inflicts a penalty of three pounds upon whomsoever, either wilfully or wantonly, shoots one of their race; and such, accordingly, is the good understanding between those of the heavy boots and the web-footed, that the latter here in the neighbourhood of Port Iron, walk about as securely and peaceably as ordinary ducks in a farm-yard. The keen eye of the gull when the herrings appear, enables him to discover the first twinkle of their scales, and detect the myriads that swim crowding together beneath the wave; and, collecting in flocks, they hover over the spot, continually marking, by their progress in the air, the finny phalanx below. The sagacious manoeuvre infuses life in the village, and the fishermen receive the signal with joy. Ever on the alert, they throw their nets in the boat, and when, after the toilsome day, they return laden to their homes, the auxiliary gulls receive the reward of their services in the small fry and garbage."

At Jurby, we find another portrait, which, in simple pathos and beauty, might well be opposed to the last we have repeated.

"We walked (says the writer) to the churchyard, where inscriptions proclaim the welcome of many a drowned mariner to his last home; and here, among strangers and his own parishioners, a late clergyman of the village takes everlasting repose. He was, long before his death, my companion informed me, a suffering, infirm man, but being stout at heart, and devoted to his calling, the more helpless the more militant he grew against increasing age and infirmities. In sickness and in sorrow he was always at his post, even to leave his bed to go

to the pulpit; and when no longer able to walk, so long as he could read the liturgy, rather than be absent on the Sunday, was wheeled to church in a common barrow. Like a hero in battle, the poor minister of Jurby, to the last hour of his life, did his Christian duty: like a hero, while living, when assailed by mortal troubles, he vigorously repelled their assault; and like a hero, now dead, he lies buried on a spot where the four winds of heaven dash fiercely upon his unsheltered sepulchre."

We add two small portions of more general description.

"The diversity of scenery within the small periphery of the Isle of Man, is really extraordinary, whether one proceeds along the line of coast, or travels inland. The attention of the traveller is by turns allured to the bluff rock—the shingled or the sandy beach—the black, angry, wave-beaten shoal—or the wide-spreading, hospitable bay. Already I had traversed mountain and moor, together with extensive tracts of rich arable and pasture; and, lastly, I encountered some thousands of acres of deep and spongy morass, as pure bog land as is to be met with in any part of the kingdom. A great part of the country, inland, between Kirkmichael and Jurby, consists of a bed of pure black peat, distinguished provincially by the appellation of 'The Curragh,' the whole surface of which is laid down to pasture, and drained by clean even-cut ditches, with a bank in the middle, surmounted by a thriving alder hedgerow. These ditches discharge themselves into a main watercourse about twelve feet wide, whence the drainage is so perfect, that there is not, as I have elsewhere observed relating to the whole island, even here, either lake, pond, or deposit. In those places where turf is dug for the purpose of fuel, it is cut in layers of a yard and a half, or thereabouts, deep, and being black and soft, is moulded into form, previous to being carted, by the hand; and here, only a few years after, a thick stratum of the surface has been thus removed, the soil again becomes covered by a thick coat of herbage. Abundance of bog-wood is furnished from this morass, and fossil remains of animals have also frequently been discovered. I saw, in the possession of a medical gentleman in Douglas, a fine specimen of horns, stupendous in size, of an animal of the deer species, and of which I believe another pair, the counterpart of these, is preserved in the Edinburgh Museum, the gift of the late Duke of Athol to the establishment."

From Kirkmichael I rode to Douglas by a mountain track, or bridle-path, that leads hence in a line nearly direct across the summit of the hills, and strikes upon the Peel Town road at Kirkbraddan. Another route to Douglas across these mountains extends from Sulby four miles from Ramsey; also by the way of Kirkbraddan. I had a pleasant ride over green hills, where the spread of sheep-walks is so extensive, as to promise, under a proper grazing system, a good return for the farmer. The few sheep that at present occupy these heights, though hardy in their nature, cannot be expected, thus living from generation to generation without a sufficiency of winter keep, to thrive, and are, consequently, a lean half-

\* We have since ascertained that it is not.—Ed. L. G.

starved race. Packs of the red-billed chough scream in concert on the dreary waste, thereby inflicting a greater appearance of desolation than ought, under favourable circumstances, to attach to the spot. I saw no good stock of any description while in the Isle of Man; neither is it probable, I think, that the case will be otherwise while the land continues to be tilled by the present mixed breed of agriculturists—half farmer, half fisherman; he who, possessing a source of profit in another direction, is thereby induced to devote a part only of his time, care, and capital, thereon. Formerly, a peculiar breed of Manx pony was in high estimation; but of late years, even these animals have dwindled away, and are not to be found. I ought to make an exception with regard to a particularly fine race of pig, almost, I think, indigenous; at least, I have never seen in England any of this marked character. At different places here on the western coast I saw three or four, weighing each upwards of twenty score, and exquisite in form; possessing length and depth of carcass, smallness of bone, diminutive legs, and a broad shoulder; the back remarkably hollow; the belly touching the ground; the ears pointing forwards; and the small nose, like that of a mole. In short, they have the form of the Chinese pig, with increased length and size, and a remarkably long-tufted stern."

Having returned to Glasgow, Sir George again set out in the steamer, *Maid of Morven*, a romantic name for a very common craft, and passed through the interesting Kyles of Bute to Oban; where, being met by the Highlander steamer, he proceeded in *her* (the highlander) on the usual trip to Staffa and Iona. Respecting the former, we see nothing of sufficient novelty to provoke extract; but select the following from his visit to the latter. The passengers, he it observed, are allowed to land for a short time at each; so, at Iona,

"A group of children, chiefly little girls, each with a plate in her hand containing pebbles and shells for sale, had already collected on the shore, and were standing in a line to receive us. Among these specimens, the light green stone especially, peculiar to the island, was in tolerable abundance, though it is singular, considering these are purchased with avidity by the numerous travellers who visit the spot, that any should now remain. Of all it may be observed, that although in the spirit of hard dealing, artfully wetted with sea-water to improve their brilliancy, they are of better than ordinary quality. As the buildings, the object of our present visit, are within three or four stones' throw of the shore, our purpose, after once being fairly landed, was speedily effected; the which was so far fortunate, inasmuch as the period allotted by the captain to this portion of our day's business, was not more than sufficient to perfect the end proposed, without affording any individual an opportunity of walking round or even across this very small island. We accordingly immediately proceeded *en masse* to the celebrated ruins of the Cathedral, the Chapel of St. Oban, and the Nunnery. The upper surface of the land appeared to be chiefly the aforesaid white sand, covered by natural, sweet, tender herbage, and abounding in mineral substances, containing mica especially, in large proportion. Of the stones, many of a greenish tinge, with which, loosely laid one upon another, the walls are composed, I hardly observed two exactly alike, excepting those of red granite, which material is universally predominant. In one place, in an excavation dug on the side of a bank, I saw a stratum two feet

thick, of perfect fossil shells. The habitations consisted only of a few small cottages, although, as if preparatory to an increase of population, a small village church had recently been endowed, and a neat manse-house built for the clergyman. It is impossible to approach these venerable ruins without a sensation of respect and awe, on contrasting sublime designs of architecture, and grand monumental reliques, with the humility of the remote spot whereon they have been placed—a spot which, to former generations, and before the invention and aid of steam, might be considered by the inhabitants of the south nearly as inaccessible as Iceland. It is extraordinary to witness a display of ornamental sepulchres here in this land of mist and storm, apart until recently from the civilised world, yet calculated, in regard to workmanship and design, to do honour to the most celebrated of our ecclesiastical edifices, whether of York, Canterbury, Wells, Westminster Abbey, or elsewhere. Some are within the cathedral, the greater part in the burying ground outside; however, the outer walls of the former building alone remain, so that these receive no manner of shelter. The ruins of durable red granite are in excellent preservation, together with various arches within, fretted work, and columns exquisitely chiselled; a forbearance, whether on the part of time or of the marauder, rather to be attributed to the hardness of the material, than the protection of the constituted authorities. Although not versed, even to a limited extent, in antiquarian lore, I could not divest myself of a feeling of sincere regret, on witnessing the more than apathetic neglect of this magnificent cemetery, wherein the tombs are exposed at present to absolute degradation. Here, in a country where want of respect to ancestry is by no means a national failing, the reliques of the mighty dead, of the dignified priesthood of former days, and of Norwegian kings, are actually lying unprotected from the wind and rain, unhallowed from desecration by the boisterous intruder, and deserted by the lords of the soil, their natural protectors. Surely, even were it considered objectionable to remove these monuments to a secure though distant spot, it were incumbent on somebody or some persons to gird the whole precincts with a fence or wall, and throw a roof above those tombs deposited in the cathedral. The latter expedient, since the walls are yet sound, even though slightly performed, would answer good purpose, and be effected at small expense."

Fingal's Cave is well delineated, and some curious anecdotes of seals, &c. are told; and then the author, at the Isle of Mull, relates how salmon are caught and preserved; which we copy for the public good.

"I had an opportunity of witnessing, within a small building in the outskirts of Tobermory, the mode there adopted of preparing salmon so as to keep fresh, when packed in tin cases, for long voyages, an operation than which none can possibly be more simple, so much so, that where fish are to be had, it may be put in practice in any place and by any body; and, in fact, the artists in Aberdeen and elsewhere, whose trade is thus to preserve provisions for sea, afford to vend meat of all sorts, fish, and vegetables, at a price so reasonable, that, considering the bone is extracted, and nothing charged for the tin case, an ordinary housekeeper might almost, from motives of sheer economy, be tempted to become a purchaser. Preserved salmon especially, fetches at Aberdeen only twenty pence a pound.\* The building in ques-

tion is merely a shed divided into two compartments on a ground floor, between which a door forms the communication of one with the other. In the first of these chambers, the fish, brought in baskets fresh from the sea, were thrown in heaps upon the floor. Here two men were at work, one of whom gutted the fish and handed them to his companion. The other man, standing at a heavy table or dresser, seizing a fish dexterously in his left hand, cut the head clean off by a single sweep of a broad knife, and then, turning it by a toss cleverly round, whipped off its tail in precisely the same manner. Not less adroitly he divided the rest in portions, as nearly as possible two pounds' weight each. He then split each slice, dividing the belly-part perpendicularly; extracted the bone; wiped it dry with a cloth; shook a little salt upon it; rolled it neatly round, and placed it in an oval tin canister, in appearance like those commonly used for containing gunpowder. The canister then being put into the scales, the artist adjusted the weight, either more or less as the case might be. Nothing more remained in this apartment to be done, and the canister was handed to the man in the other chamber, for the purpose of being closed. This operator was employed continually in making the canisters, and soldering them in the usual way, without any further care or precaution than is exercised by an ordinary tinman. Mere chance, after all, conducted me to the above-mentioned building, of which, the entrance being open, I walked in; in fact, I should not, probably, have observed it at all, but for the loads of fish on men's shoulders, then on their way from the boats, and the abundance of refuse and offal that lay on the shore. And thus, frequently, the identical cause that renders a spectacle interesting to a stranger, becomes the very reason that prevents him from seeing it, since people are wont to imagine things necessarily unimportant to others, merely because the same have long since ceased to be regarded as novel by themselves."

This *Salmonida* leads to an episode *en masse* goose-killing in Lincolnshire; and, as the mode of the massacre of these innocents may be as little known to others as to ourselves, we lay before them the frightful picture.

"I was (continues Sir George) similarly indebted to the kindness of fortune on another occasion, the particulars whereof I will here introduce, not only in exemplification of the foregoing remark, whereby I was within an ace of passing through Lincolnshire without visiting a slaughter-house of the native geese, but since the subject I am upon is one of comestibles and provisions for the table.\* Two years ago, while remaining a day in the town of Boston, my attention being then chiefly directed to the gigantic operations that propel the stagnant waters of the fens in artificial rivers of the sea; I had intended to bend my way to whatever spot I might see to the greatest advantage the means and the effect, whereby the science of drainage has there been conducted to so vast an extent. And having previously visited the noble old church, whose eight spires, airily supported on lantern arches, springing from an octagonal turret, are only equalled by the architectural symmetry within the building, where the whole aisle and transepts, in unbroken space, and under one roof, are supported on lofty pointed arches of exquisite form, I had nothing, in fact, else to do, when, by mere chance, as I have already hinted, my attention was called to the red field of blood.

\* The writer's sense is left here incomplete; but his meaning is obvious.—Ed. L. G.

\* This appears to us to be very dear.—Ed. L. G.

whereon hundreds of poor geese yield up their lives daily, and perish, generation after generation, for the benefit of mankind. As I was strolling onwards in the direction of the fens, I had hardly proceeded clear of the suburbs of the town, when the busy hum of imprisoned thousands was borne upon the breeze, as of those multitudinous throngs which, during the depth and intensity of winter, are seen gallantly piercing the snow-storm in pointed column, and murmuring in gentle cackle as they plod along. For a moment I attentively listened, but a moment, to ears accustomed to rural sounds, was quite sufficient to reconcile localities, and account for the phenomenon. A few minutes more conducted me to the very spot from whence the sound proceeded, where, on a small plot of ground, a quarter of an acre in extent, a drove of five thousand geese were closely penned like sheep, cackling their sorrows to the winds, and awaiting their melancholy doom. From a thousand to sixteen hundred a week here die regularly by the hands of the executioner; and, as I learnt, upon making inquiry, that, according to arrangement carried into effect by the proprietor of the establishment, three days in every week, of which the morrow was one, were set apart to slaughter, I made up my mind to go the next morning accordingly, and witness the ceremony. Many a householder exists at the present day in the united kingdom, who, whether his income be large or small, and no matter what his religious and political persuasion, in conformity with irrefragable custom, and under the auspices of our benevolent King William, at least once in each year, at the head of an obedient family, like a mail-coachman mounted on the coach-box on a gala day, sits in the pump of conjugal and paternal authority, knife and fork in hand, behind a fat, fragrant goose on Michaelmas-day. But little does he reflect, while, with glistening eyes and watering chops, his nostrils regaled with exquisite odour, his chest inflated by the consciousness of powerful digestion, his fore-arm resting horizontally flat upon the table, and his implements pointing upwards at right angles towards the ceiling, he ponders and meditates on the first incision, while the eyes of his helpmate, roving anxiously around lest the pinfeathers of their hungry offspring slip perchance beneath their chins, with gesture more authoritative than elegant he beckons backwards with his thumb across his shoulder, and the perspiring handmaid presents to him the steel; while, in anxious silence, the wife and children sit patiently watching his motions, and listening to the whistle of the bright blade, and the brisk rat-tat-tat-tat of the aforesaid implement; and finally, though the bird squeaks and hisses on the table, as if it were alive, and the gravy springs at the first cut from its bosom like a stream of blood: little does he reflect, I say again, as relates to the juicy martyr on his board, upon that dismal tragedy that I will now proceed to relate. At ten o'clock the next morning, when I arrived on the premises, two hundred and sixty geese had been already barbarously assassinated out of six hundred, the number on that day doomed to die. The dead birds were all plucked, trussed, and laid in order, neatly ranged on shelves, wherewith this, the first and outer apartment, was surrounded. The said apartment communicated by an outer door through the back yard of the premises by a series of wicket gates, to the plot of ground already referred to, and also by partitions with two other chambers, in one of which the geese were killed, and in the other stripped of their

feathers. In the first of the two latter chambers, three boys were employed. The first boy, by virtue of his office, drove the geese a dozen at a time from the grand depot into a pen parted off in one corner of the apartment, and these, batch by batch, were usually disposed of as quickly as he could go to the depot and return. The second boy, though in point of fact he acted the part of a hangman, did nothing more than, taking each goose one by one out of the aforesaid pen, prepare it for execution. To this end, by a dexterous twist, he entangled together the pinions of the bird behind its back, and inserted its legs in one of eight nooses that hung suspended five feet from the ground against the wall, over a long trough which rested on the floor to catch the blood. The third boy's business was simple and sanguinary—merely that of cutting throats. Of this young matador, though scarcely twelve years old, the trenchant blade had not only passed across the weasands of all those geese that had already given up the ghost, but ere the sun had passed his meridian, the death-cackle of the whole devoted six hundred had sounded in his ears. His whole care and attention was necessarily occupied with the dying; though frequently unawares, and in despite of his best efforts, he received a flapping from a gory neck, or a tingling stream of blood spirted in his eye; whereat his countenance would gleam with a ludicrous expression of alacrity and surprise. He would then compose the limbs of his victims in death with double diligence, yet only precisely so long as they shewed by fluttering, in their last moments, a disinclination to behave decently. Afterwards, he allowed every goose to go out of the world in the best manner it could. So soon as a goose appeared thoroughly dead, its legs were disengaged from the noose to make room for another, when the defunct bird was tossed out of the chamber of death, through a small square window or aperture that communicated with the plucking-room. Here, behind a large table or dresser sat seven men and one woman, upon low seats, enveloped in a cloud of dust and down, and up to their hips in feathers; wherewith altogether they were covered with such profusion, that among the eight individuals, it was difficult at first sight to point out which was the woman. These people were paid for their labour, as I was told, at the rate of a shilling a score, whereat, such is their dexterity and strength of thumb, that some are able at the aforesaid price, provided they have geese to pluck, to earn ten or twelve shillings a day. As near as I could judge, a goose was plucked naked as a needle in about six minutes; a plump fat bird, at all events, every forty or fifty seconds, from either one or other of the operators, was pitched heavily on the dresser. Thus, the artists, without favour or delay, vigorously pursued their work, while the noise of quills relentlessly ripped from their sockets, sounded like the crackling of a faggot in a baker's oven, or twigs snapped in twain by a lusty donkey, as he bursts through a thicket. Each goose, so soon as plucked, was pitched by the plucker, as I have before observed, upon the dresser. Hence it was removed by the man presiding over the first outer apartment already mentioned, and then immediately scientifically trussed and deposited on the shelves. After witnessing the various operations now described, I paid a short visit to the premises in the rear of these apartments, where a small steam-engine is continually kept at work in the double operation of grinding meal for the geese's

food, and stirring and pounding the same into a compost together with potatoes. Three men, moreover, in the yard adjoining, sap green as high as their waistbands, were hard at work loading carts with shovels from a large heap containing at least a dozen wagon loads of pure goose manure. The reader now will, I trust, have formed an idea of a Lincolnshire poulterer's establishment, although, than the one cited, there are others, I believe, considerably more extensive. From hence the geese are despatched regularly to the London market, packed in baskets containing twenty-five birds each, of which baskets twenty-five also make a wagon load, in weight, supposing each goose on an average to weigh eleven pounds, upwards of three tons. The wagons are forty-eight hours on the road, and the cargoes, on their arrival, consigned to salesmen, are disposed of to the poulterers."

Another voyage to Inverness, and a brief tour in Ireland, and the memoirs of an assistant-commissary, we shall leave to our readers, merely remarking, that they are all quite unconnected with each other; and conclude with one passage from the Guernsey visit, which relates to a subject of considerable interest, the naturalisation of sea-fish in fresh water, some of the particulars being new to us:—

"By means of an open watercourse passing from a small lake within, through the mound or sea-wall into the sea, and a strong iron-grating on the inside, contrived to admit the ingress and egress of the tide, and to confine fish of moderate size within the lake, several sorts of salt-water fish have been by degrees subjected to the inundation of fresh water. Scientific people have faith in the result; and certainly here sea-fish have lived and thriven for weeks in succession, the sea being totally excluded by the sluice-gate, and the salt water sufficiently diluted by fresh streams, to induce cattle to drink it without hesitation. Being introduced by a friend to the owner of the lake, the latter kindly ordered a couple of men to haul a drag-net across to gratify my curiosity, the water at the same time being so fresh as to be merely brackish. The wind unfortunately was so unusually high that the haul was unsuccessful; the net, moreover, was lightly shotted, and the fish leaped clean over it into the water; wherefore, though I saw many, owing to being thus disturbed, about half a dozen gray mullet only were brought on shore. From their size and condition, since they had lived here some weeks, one might fairly conclude, that their nature, if not at first congenial, was reconciled to the fresh pasture; and I had a further opportunity with reference to the same fact of adding a word as to their firmness and flavour, having eaten of them the same day, and found them excellent at dinner. Besides the mullet aforesaid, turbot, plaice, and smelts, were denizens of the same domain, all in equally prosperous case and healthily. Serious devastation, the proprietor informed me, was occasionally committed by fresh-water eels, that, large and ferocious, allured by exclusive society, and finding their way nobody knew how into the assembly, set to work on their arrival without favour or ceremony, and devoured natives and foreigners together. What a field of watery speculation would at once be thrown open, were it ever deemed possible, as in the instance above stated, though on a more extended scale, thus to subject sea-fish to amphibious usage; and by the assistance of art or scientific persuasion, to control their exuberant fecundity. The salmon and the eel, pioneers of two distinct tribes, the scaled and unscaled, in accordance with their nature at

certain seasons of the year or otherwise, leave the sea to inhabit fresh rivers, which fact perhaps argues capabilities of organisation with reference to the whole species, which, if put to the test, might be further extended. At any rate the subject creates amusing speculation, with reference to making our lakes and rivers receptacles for bringing the nations that inhabit the world of waters into converse with each other, and naturalising of the animal kingdom almost the only creatures not yet domesticated by the hand of man. Thus cod and haddock may eventually learn to live in placid brotherhood with perch and roach, and the wild salmon rub his silver sides in amity upon the copper-coloured carp. In many parts of England pure salt water reservoirs are already employed with advantage, but none that I know of have yet effectually superseded the tanks of the London fishmonger. Yet on many spots on the coast reservoirs might be contrived of enormous dimensions, capable, whether supplied by wind, water, or steam, with sea water, of containing fish in almost unlimited numbers. It is extraordinary that, while every individual in the kingdom is more or less interested in the distribution of this boon of bountiful nature, fishmongers, almost without remonstrance, have maintained absolute and continued monopoly; neither do the inquisitive or discontented trouble themselves to know those details of combination, whereby an uncertain supply is subjected to certain demand, and large quantities of fish abstracted and perhaps destroyed, to prevent a glut in the market."

*The Keepsake, for 1838: New Series.*

London, 1837. Longman and Co.

AN advertisement prefixed to this volume, says "The proprietor having ascertained that a belief exists that the articles for the *Keepsake* have occasionally been selected less in reference to their intrinsic merits, than to the names of their author, has determined to escape the imputation, by publishing the work anonymously. If this mode obtain the public approbation, it will be continued; but if otherwise, he trusts that he will be considered justified in reverting to his former plan."

"It must not, however, be supposed that this statement is intended to imply that the *Keepsake* has entirely divided itself from its old connexions. On the contrary, nearly all the most eminent of its former contributors still devote their talents to its pages; but several new writers of equal celebrity have been employed."

Our attention is particularly called to the literary portion of the Annual before us (and we must add with regret) by this equally injudicious and ill-written prefix. Even on the ground of *omne ignotum pro magnifico*, the proprietor is, in our opinion, mistaken in fancying that the anonymous possesses as much interest with the purchasers of this class of works, as the parade of high names. Supposing the material to be about the same calibre, and we see little difference, certainly no improvement, in the present instance; it is clear that the natural curiosity to see how the Lord This and the Lady That, and the Right Honourable So and So, can write, must be in some measure a stimulus to the market. Namely Pamby is none the worse for having a Peer for a poet, and Commonplace is at least as agreeable from a Member of the House of Commons as from a nameless Nobody. Then, should there be merit, how fine to find it in a minister of state? if originality, in a worn out man about town?

So much for the general principle announced in this new series—a principle, we will venture to predict, that next year will see abandoned. Come we to the vague flourish which is substituted for real names. All the most eminent of the past *Keepsakes*, we are assured, continue to devote their talents to its pages, while several new ones of equal celebrity have joined the band;—"been employed," is a vile bookseller's hack-like phrase, and must be offensive to the ears polite of such eminent persons as contribute to this miscellany, which has not "entirely divided itself" (another vile phrase) from them. But, no matter for these things—the admirable old connexions have been reinforced by equally admirable recruits; and the mass of the conjoined corps has produced twenty-one "articles." Of these, the majority, twelve, are poetical, and occupy twenty-six pages; one only being, by its length, redeemed from the category of Sonnet, Enigma, Lines on a Picture, Lines on a Christening, &c. &c. Nine prose "articles" remain to be accounted for, and they consist of tales of the average cast, belonging to similar publications, not one of them challenging to be regarded as an immortal, or more than annual production, of any individual in the ranks of this renowned phalanx, of twenty-one at the utmost. The fact is, that the *Keepsake* for 1838 is not only anonymous, but not above mediocrity.

We believe, speaking of the annuals generally, that their literary attractions have much degenerated; and that they now place their reliance principally on their engravings. Nor would it be difficult to account for this, at least to a certain degree, in one striking point of view. Soon after their establishment, with competition running high, their proprietors or editors sought and paid for the best literary contributions they could obtain; and though somewhat obscured by the admixture of contemporaneous imbecility and trash, we are bold to say, that from these volumes a selection might be made, which would do great honour to the polite literature of any age or country. But, by degrees, other systems crept in. One annual begged where it should have bought; another got up balaam among the cheap serviles of the press (the dear at any price); a third relied solely on fashionable distinctions; and (not to mention those who stole what they could) all began to lavish on the embellishments that portion of outlay which was justly due to lettered talent and genius. The horse could hardly carry double; but if it did, literature was either made to ride in flunkey poverty behind, or prayed to exhibit itself gratis on the pillion. For a single subject and its engraving, more was given than for all the literary treasures of a volume: is it wonderful that the prints should be very pretty whilst the print is very poor? Taste and judgment, combined with a liberal, not profuse, expenditure on the literary contents, can alone restore the annuals to any thing like decent consideration and public patronage in this respect. As it is, most Nos. of the monthly magazines, at their two shillings or half-a-crown each, display infinitely more ability and originality than a fifteen shillings or guinea yearly performance; and the year's Nos. of one of our best magazines would infinitely outstrip all the annuals put together.

Far be it from us to desire that the exercise of the fine arts should not have its ample reward; but it will not, alone, support this numerous class of publication, and is also, from over use, sinking into great sameness and mannerism. The branch itself, on the reduced scale to which it is limited in these works, is

injurious to the higher productions of art; and, instead of noble designs worthy of everlasting admiration, we have now only too many mere toys and gauds for the amusement of the hour in portfolios or albums. That such things should also supersede all literary merit in so large a range—more, perhaps, than sixty or seventy thousand volumes every year—is much to be regretted; and we trust hereafter not to see that division, which ought to afford present delight and long extended fame, almost altogether sacrificed to pictorial ornaments and even to binding. The latter of the *Keepsake* is very handsome, and we will be bound cost ten times as much as its literature. We have to add, that the size of the new series is enlarged, and looks well.

*Illustrations of Scripture, &c. By S. S.*

London, 1837. Hatchard and Son.

IT is not often that we meet a volume of poems that holds out so much promise as the one before us. The numberless slight tomes which every week carries into obscurity have generally a strong family resemblance; they indicate taste rather than talent, and generally faint copies of some favourite original. This is not the case with the pages now before us; they are the first effort—the trying the wings, as it were—of an obviously powerful mind: there is the enthusiasm and the real feeling which belong to one whose real vocation is literature. Poems on sacred subjects are not often successful; but here are not mere attempts to versify scripture passages, but bursts of devotional feeling, or strains of solemn thought, suggested by particular texts. The minor poems are all of a serious order; but the seriousness is softened by touches of affection, and enlivened by a keen sense of natural beauty. The following specimens are all marked by individual character, and the description in the second singularly beautiful.

"The Pilgrim."

"How can I leave this resting place—  
This home of early years—  
My cherished home of heart and mind,  
Without some parting tears?  
How can I willful memory curb  
From ranging o'er the past?  
How the prophetic fear control,  
By the dark future cast?"

The past—its hours have been to me  
Part sunshine, partly shade;  
The joyful ray, the tearful cloud,  
Life's circling iris made:  
The future!—on I shrink to gaze,  
While pausing on the verge  
Of earthly change, for much I dread  
The storm-clouds it may merge:—

For must I not, in this farewell,  
My youth's calm morn resign,  
To wander onward wearily—  
In the world's glare to pine?  
Here hath my spirit thrilled to strains  
Of pleasure's varying choir,  
Yet echoed too the sadder tones  
Of melancholy's lyre.

Here have imagination's hues  
Brightened all meaner things,  
While thought communed with yon sky  
On faith's immortal wings:—  
Here high resolve and energy  
Have nerved my youthful pride,  
And prospects rich as fabled lands  
Hath fancy's wand supplied.

And here, oh, first my being's depths  
Answered affection's call,  
While sympathy's blest atmosphere  
Life's air pervaded all:—  
Thus, ever from the world's wide sea  
I've turned, the peace to gain  
O' thy dear shore, my faithful home,  
Nor sought thy calm in vain.

But thou wilt yield me rest no more,  
Strangers will own each scene,  
And I shall soon an alien be  
Where as a child I've been.  
They tell of distant scenes as fair,  
Of suns and skies as bright,  
Where flowers, and trees, and gentle streams,  
And birds, as well delight:—

It may be true; but what to me  
Is radiant earth, or sky,  
However fair—however bright—  
Without *home's* melody?  
Here my heart's history is portrayed  
As it can be no more;  
Life's record on each object's traced  
Whose loss I now deplore.

Yes, I must own the mournful truth,  
Which long I strove to hide—  
Earth can no resting-place ensure,  
Where pilgrims may abide.  
Pilgrims! that name inspireth hope  
Of blessings yet to come!  
Though telling of a wilderness,  
Breathes it not too of home?

Why should a pilgrim then lament,  
Toiling o'er desert-sand,  
Because he finds not cities fair?  
Hath he no fatherland?  
Why should an Alpine traveller mourn  
He may not sleep mid snows?  
Awaits him not a home, where dwells  
No danger with repose?

Parent Divine! and shall thy child  
Murmur, if change blight calm?  
In evil wilt thou not sustain,  
And soothe with heavenly balm?  
Under the shadow of thy wing  
Doth not peace ever dwell?  
And will not thine approving smile  
Give joy unspeakable?

And have I not a changeless home,  
By thee in heaven prepared?  
A home where all is perfected—  
By perfect beings shared?  
A rest remaining, knowing not  
The shadow of a cloud—  
Where disappointment, care, exile,  
Ne'er shall my spirit shroud—

Where bloom immortal youth and joy,  
On all Heaven's seal will be  
The impress of my Father God—  
Stamp of Eternity!  
Is not my fainting heart now cheered,  
By musing on the blest?  
Life's wearying way, refreshed with dew,  
Shed from yon home of rest?"

"*Fragmente. Christmas, 1835.*

"Nay, tell me not again of wintry gloom,  
Of sullen skies, of withered leafless forms,  
Of beautiful scenes as those in eastern tale,  
Spell-bound, as if by some magician's wand.  
True, the enchanter, Frost, hath wrought his spell,  
Yet kindly wrought. Since summer leaves are gone,  
And summer fruits and flowers, 'tis well to hide  
The ruin with fresh beauty:—yea, 'tis well  
To fling a bright robe o'er the desolate,  
As o'er the cares of life we cast the light  
But glitt'ring world-wove mantle of false smiles.  
Yes, though 'twas winter, 'twas a glorious scene  
Where Christmas held his court. Ice palaces  
And crystal-columned temples of pure snow  
Were imaged there; each point reflecting gleams  
Of passing sunshine. Gems as radiant too  
As purest diamond, or orient pearl,  
Flashed from each object. Not the fabled wealth  
That on Aladdin burst, within the cave,  
From jewelled trees; and not the coral groves  
Beneath the ocean-wave, where Peris hold  
Their revelry, more gazing could appear.  
From stately cedar's loftiest spreading branch  
To mournful willow's drooping bough, and o'er  
The shrinking half-awakened violet,  
An unseen spirit-hand each varied form  
Had crystallised with geometrical skill,  
And often as the wind careered swept  
The wavy stems, bright particles of snow,  
Like sunbeams glancing from gay plumed bird,  
Or blossoms shook from spring's wreathed coronal,  
Fell stillly on the earth. Brief pageantry,  
Too soon dissolved—while gloom, and sombre hues,  
The landscape soon pervade:—thus quickly chased  
Are fancy's visions from the waking eye,  
When on the world of dreams breaks morning's light.  
All was not gloom; and sheltered green-house plants  
Resembled hopes when outward joys are fled,  
Expanding in affection's genial air."

"*A Recollection.*

"A scene of phantasy—magnificent—  
With all that art and taste could yield, adorned,  
Whose very atmosphere breathed harmony.  
Yet turned I from surrounding forms and things,  
Brightening with noon-day radiance evening hours,  
To one sweet form, that stood in rich relief  
From glowing folds of crimson drapery,  
Beside me,—like an antique statue: fair  
And marble-like her classic features were;  
Woman's most precious gem shone on her brow,  
Even purity of heart and mind;  
And in her gentle eye softly reposed  
Emotion's eloquence: grace, dignity,  
With moral energy, and high resolve,  
Hovered around her—such can woman be—  
Then at that thought, my heart found vent in song:—

Oh! gently as the snow-flake melts,  
When falling on the wave,—  
Yet deeply, as some fine-wrought seal,  
Can its own impress grave;—  
Thus gently, deeply, lady fair,  
Into my soul hath passed  
Thine image, where its memory pure  
Shall long, long freshly last!  
For like some cherished melody,  
Whose tones the spirit thrill,—  
Although the sounds have died away,  
It haunts remembrance still.  
Ay, truly, as some clear bright star  
That decks the night's dark brow,—  
If once the wanderer it have cheered,  
Is loved by wanderer now.

Thus, lovely one—a treasured charm  
Thy name will be to me,  
Waking a thousand pleasant thoughts  
Of happy memory.  
That hour—its forms and phantasies,  
And dream-like scenery gone—  
Hath left thee lingering in my heart,  
Thou kind, thou lovely one!"

We would also draw attention to some striking prose fragments, which shew a spirit of analysis and reflection from whose results much is to be expected.

*A Dictionary of the Artists of Antiquity, Architects, Carvers, Engravers, Modellers, Painters, Sculptors, Statuaries, and Workers in Bronze, Gold, Ivory, and Silver; with Three Chronological Tables, by Julius Sillig, translated by the Rev. H. W. Williams. To which are added, C. Plinii Secundi Naturalis Historiæ, lib. xxxiv. to xxxvi. c. 8-5. With Four Indexes and a Preface. By E. H. Barker, Esq. 8vo. pp. 61. London, 1837. Black and Armstrong.*

THE literary labourers of Germany are justly celebrated for the minuteness and universality of their researches in the wide fields of antiquity, so long trodden, yet still so imperfectly explored by modern inquirers. We more than doubt,—indeed, we even despair, of complete success in our actual investigations into the real form and aspect of the classical world, from the broken fragments scattered amongst its ruins, as well as from the more perfect *torsi* that claim the involuntary homage of every mind. They mock, indeed, the hopes of recovery and the arts of restoration; but they still, in all their incompleteness, like the fossil bones of animals, remain to impress us with the indelible stamp of a former and mightier mode of existence—at least in art.

Whatever may be the general appreciation of German literature in England,—and we think that here, as in its native land, opinion runs pretty equally into the two extremes alone—it has never, we believe, been doubted, that the laborious diligence of the learned of that nation has succeeded every where in heaping together an enormous mass of facts; though the sifting and arrangement of these may not always have answered our expectations. But as the pioneers of learning, they have ever been reckoned invaluable; and the work before us is an additional instance of this truth.

The volume justly sustains the high celebrity of Mr. Sillig abroad; and we are struck in every page with the multiplied research and patient comparison of every passage and hint in the ancient writers, so useful in assisting us to form a distinct idea of art and artists, as they existed in Greece and Rome. We must confess ourselves strongly inclined to the opinion, that the duration of the former state was not sufficient to account for the perfection which the Greeks attained in art; and, if their literature be adduced as an example of the contrary, we should be tempted to place it also in the same category. But we have little space to devote to so wide a range of inquiry at present, and must confine ourselves to Mr. Sillig here.

The editor has candidly pointed out some deficiencies in the volume in question, and which he trusts to supply hereafter; but, as it stands, Mr. Sillig has undoubtedly supplied a *desideratum* to the lovers of art, and in a shape that will lead many amongst us to prosecute and extend his researches. The few works which, like Lempriere's Classical Dictionary, contain all that we have ascertained on the subject, are so concise, or so meagre and unsatisfactory, that the artist, the amateur, and the student, will gladly hail any addition to the existing stock of information; and this he can find but few so capable as Mr. Sillig to supply. It is not merely the statements and hints of antiquity that are brought before him: the theories subsequently founded upon those details are here collected by the multifarious reading of the author, and examined and discussed with the light of thought and the care of learning. So that, in truth, each of the more important notices forms an essay of itself, in this small but useful volume. We would take as instances the articles, Agatherchus, Ageladas, Anthermus, Dædalus, Euthygrates, Mys, Parrhasius, and Polygnotus; admirable supplements to the articles in any biographical dictionary.

The three tables of the state of the arts in Greece: 1st. from their introduction till the time of Phidias; 2d. thence to Lysippus and Appelles; and 3d. from that period till they ceased to be cultivated, slight as they are (and this is a defect), are useful, as condensing into one point of view, the dates, Olympiads, state of literature, public games, and the drama, with the political events, and the lists of principal artists and their works.

We have room but for two extracts; the first from the article, Phidias.

"Pliny (34, 8, 19) observes, that he flourished in Olymp. 84; and the reason of this statement is obvious. In the period in question, Pericles became the leading statesman of Athens (Clinton, Fast. Hellen. ad. a. 444, and 429), and immediately procured the formation of many illustrious works of art, some of which were executed by Phidias himself, and others were made under his inspection. In the third year of Olymp. 85, B.C. 438, while Theodorus was archon, Pericles dedicated in the Parthenon the celebrated statue of Minerva, composed of ivory and gold (Euseb. ad h. a.), and this fact confirms the statement of Pliny, or rather of the writer, whose testimony Pliny approved, because it shews that Phidias must have commenced this very laborious performance in Olymp. 84. A different account, however, seems to be given by Philochorus, as quoted by the Schol. Aristoph. Pac. 604:—*Φιλόχορος ἰπὶ Πυθιδόρου ἀρχόντος παύσθαι* 'Καὶ τὸ ἄγαλμα τὸ χρυσεῦν τῆς Ἀθηνᾶς ἱστάθῃ εἰς τὸν νῦν τὸν μῆνα, ἔχον χρυσεῖν σταθμὴν τελέωνται μὲν, Περικλίου ἱκισταμένου Φειδίου δὲ ποιήσαντος. Καὶ Φειδίας ὁ ποιῆσας, δέξας παραλογίζεσθαι τὸν ἐλπίσαντα σὸν εἰς τὰς φολίδας, ἐκείδῃ, καὶ θυγὸν εἰς ἥλιον ἐργολαβῆσαι τὸ ἄγαλμα τοῦ Διὸς τοῦ ἐν Ὀλυμπίᾳ λίγισται. Τούτῳ δὲ ἐξεργασάμενος ἀποθανεῖν πρὸ Σπυθιδόρου, ὃς ἔστιν ἀπὸ τούτου ἴδιον.' Φειδίας, ὡς Φιλόχορος φησὶ ἰπὶ Πυθιδόρου ἀρχόντος τὸ ἄγαλμα τῆς Ἀθηνᾶς κατασκευάσας ὑπέλιπε τὸ χρυσίον ἐν τῶν θεαμάτων τῆς χρυσελεφαντίνης Ἀθηνᾶς, ἢ ὃ καταργησθεὶς ὑπ' αὐτῶν ὡς τοσιφάμενος ἀπείρηθ'."

On this passage the author remarks:

"We must first observe, that there never was an archon of the name of Scythodorus, and that the term Σπυθιδόρου must be an error of the scholiast, or of a transcriber, who, finding in Philochorus the word Πυθιδόρου, and

conceiving that it involved difficulty, introduced a new archon, who should be considered as ruling B.C. 429,—a year in which Pericles was dead. These views are advanced by Palmer (*Exercit.* 746), and are approved by Coriini (*Fast. Att.* 3, p. 217); but it is questionable, whether another opinion of Palmer,—that Πυθόδωρου, in the commencement of the passage, should be changed to Εὐδοκίου,—is equally satisfactory and probable. The design of the proposed alteration is to reconcile Philochorus and Eusebius; but Heyne has properly remarked (*Antiq. Auf.* 1, 197), that Philochorus, in narrating the transactions of the archonship of Pythodorus, had in view, not the statue of Minerva made by Phidias, but the accusation brought against the artist, and that he adverted to the former only for the sake of illustration. The correctness of this method of understanding the passage will be evident on attentive inquiry; and thus the first remark of Philochorus must be considered to imply, that Phidias died in Olymp. 87. 1, B.C. 432,—a circumstance confirmed by the second Scholium adduced, when the stops are correctly arranged, (ὡς Φειδοχόρος φησι ἐπὶ Πυθόδωρου ἀρχόντος); and there is, consequently, no contradiction between Eusebius and Philochorus. (See the remarks of Müller, l. c.)

We quote also the passage relative to the unjustly alleged criminality of the immortal statuary.

"I must remove some difficulties, which may arise from the account of the accusation of Phidias—a fact adverted to by Plutarch, (Pericles 13), Philochorus (in the passages already cited), Diod. S. (12. 30.). All these writers agree, that Phidias was accused of embezzling some of the gold entrusted to him for the statue of Minerva; but they differ as to the time in which the accusation was brought. Philochorus states, that Phidias, after his trial and condemnation, fled to the Eleans, among whom he constructed his statue of Jupiter, and by whom, as some understand the passage, he was killed, as if in return for his services as an artist. But, as Philochorus does not intimate, either in the former or the latter passage adduced, that any theft was committed by Phidias, in making the statue of Jupiter, it appears strange and inconsistent, that Phidias should have been punished with death by the Eleans; and, as neither Plutarch, nor Diodorus S., nor even Pausanias, has at all adverted to such an act on the part of the Eleans, I regard the words, ὑπὸ Ἑλλήνων, usually inserted in the passage of Philochorus, as a ridiculous interpolation of the scholiast. Philochorus could not have designed to make the statement in question; and in the latter passage, where he repeats his narrative respecting the statue of Minerva, he adverts to the violent death of Phidias, but does not state that it was inflicted by the Eleans. The words ὑπὸ αὐτῶν can only be understood respecting the Athenians, since Athens had just before been expressly mentioned. Away, then, with the second embezzlement attributed by some recent critics to Phidias. Away, too, with the supposition, that the Eleans inflicted on Phidias the punishment of death. To the statement of Philochorus, or of the scholiast who cites his words, respecting the flight of Phidias, after his impeachment and condemnation, to the Eleans, we must oppose the following passage of Plutarch.

Here we have nothing respecting the condemnation of Phidias on the charge of theft.—nothing respecting his flight, and his statue of Jupiter Olympius, as consequent on it: it is explicitly

stated, that Phidias, after refuting the charge of embezzlement, was condemned on the ground of having acted irreverently, in connecting his own figure, with that of Pericles, with the hand of the goddess—and that he died in imprisonment, though it is left uncertain whether he was merely confined, or was subjected to the actual infliction of punishment. Diodorus S. (12. 39) so far agrees with Plutarch as to mention the refuted charge of embezzlement; and there are many considerations to prove the great probability of the narrative of Plutarch. Hayne (*Antiq. Auf.* 1, 197) remarks, on the authority of Philochorus and Heliodorus as cited by Harpocration (*ὕ. Περὶ τῆς αὐτῆς*), that the Propylæa were commenced, while Euthymenes was archon, in Olymp. 85. 4, B.C. 437, and finished during the archonship of Apseudes, in Olymp. 86. 4, B.C. 433. As the completion of the vestibule of the Athenian citadel was considered to render the citadel itself perfect, the statement of the entire expenses incurred was, in this year, presented to the λογισταί. After this period, we have no mention of any public work projected by Pericles; nor, indeed, could this statesman afterwards engage in the improvement of the city, because the Peloponnesian war immediately arose. Thus, we have an explanation of the fact, that Phidias was impeached in the year in which Pythodorus held the office of archon, and the whole series of facts becomes perspicuous and consistent."

Our other extract is from the article, Lysippus:—

"There can be no question that he was a contemporary of Alexander; and the date to which his life was protracted can be learned with tolerable certainty from the fact, that he made a group of equestrian statues, representing those friends of Alexander who were killed at the Granicus, in Olymp. 111. 3. B.C. 334. This circumstance authorises us to conclude, that he lived to Olymp. 114; and the reason why Pliny selects this particular Olymp. in stating the age of Lysippus, is probably this, that it was that in which Alexander died. That the life of this artist extended far beyond this Olympiad, is scarcely probable; for Paus. (6, 1, 2.) mentions a statue of Troilus made by him in Olymp. 102. Οὐλαμπιάδι δὲ ἐκράτει Τρώϊλος διωτὴρ πρὸς ταῖς ἱερῶν.—Τούτου μὲν δὲ τὸν ἀνδριάντα ἱστορεῖται Ἀδριανῶς. If, then, we assume, that Lysippus was 20 years of age when he made this statue, and add the 50 years intervening between Olymp. 102, and Olymp. 114. 2, we must consider him to have attained the age of 70 at the latter period."

We consider, however, that the editor, if he meant, as he appears to have done, the work to be popular in England, should have given translations of the passages from the classics, in their proper places: as all readers have not the same facility in the original languages, and such an addition would have been more generally useful than the inserted extract from Pliny's 'Natural History,' a work in every one's hands. The volume is, nevertheless, indispensable in every library, and a short appendix will supply every defect.

*History of Europe from the Commencement of the French Revolution in 1789, to the Restoration of the Bourbons in 1815.* By Archibald Alison, F.R.S.E. Vol. VI. Edinburgh, Blackwood and Sons; London, Cadell. 1837.

As this work has been noticed during its progress, in the manner it so well deserves, we shall merely introduce this massive octavo (which also reached us late) by the selection of

two of its striking passages: the first summing up the attempt of Napoleon on the crown of Spain; and the last giving a comprehensive view of that country, which cannot fail to be more than commonly interesting at this moment, when it is the theatre of so important and uncertain a war.

"In authorising or committing these enormous state crimes, Napoleon and France were, in truth, acting in conformity to that moral law of the universe which dooms outrageous vice, whether in nations or individuals, to prepare, in the efforts which it makes for its present gratification or advancement, the means of its ultimate punishment. Napoleon constantly said, and said truly, that he was not to be blamed for the wars which he undertook; that he was driven on by necessity; that he was always placed in the alternative of further triumphs or immediate ruin; that he was, in truth, the head of a military republic, which would admit no pause to its dictator in the career of victory. There is no one who attentively considers his career but must admit the justice of these observations, and absolve him individually, in consequence, from much of that obloquy which the spectacle of the dreadful and desolating wars in which he was so powerful an agent, has naturally produced among mankind. But that just indignation at the profuse and unprofitable effusion of blood, which has been erroneously directed by a large and influential class in France to the single head of Napoleon, should not, on that account, be supposed to be ill founded. The feeling is just, the object only of it is mistaken; its true object is that selfish spirit of revolutionary aggrandisement which merely changed its direction, not its character, under the military dictatorship of the French emperor; which hesitates at no crimes, pauses at no consequences; which, unsatiated by the blood and suffering which it had produced in its own country, sought abroad, under his triumphant banners, the means of still greater gratification; and never ceased to urge on its remorseless career, till the world was filled with its devastation, and the unanimous indignation of mankind was aroused for its punishment."

We now give the second extract.

"The Spanish Peninsula, in which a frightful war was now commencing, and where the armies of France and England at last found a permanent theatre of combat, has been distinguished, from the earliest times, by memorable achievements, and is illustrated by the exploits of the greatest captains who have ever left the impress of their actions on the course of human events. The mighty genius of Hannibal there began its career, and, under the walls of Saguntum, gave the earliest token of that vast capacity which was soon to shake to its foundation the enduring fabric of Roman power; Scipio Africanus there first revived the almost desperate fortunes of the republic, and matured those talents which were destined, on a distant shore, to overthrow the fortunes of the inveterate enemy of his country; the talents of Pompey, the genius of Cæsar, were exerted on its plains; a severer struggle than that of Pharsalia awaited the founder of the empire on the shores of the Ebro; the desperate contest between Christianity and Mahomedanism raged for centuries amidst its mountains; and from their rocks the wave of Musulman conquest was first permanently repelled. Nor has the Peninsula been the theatre, in modern times, of less memorable exploits: the standards of Charlemagne have waved in its passes; the bugles of Roncesvalles have resounded through

the world; the chivalry of the Black Prince, the skill of Gonzalvo of Cordova, have been displayed in its defence; the genius of Napoleon, the firmness of Wellington, have been exerted on its plains; and, like their great predecessors in the wars of Rome and Carthage, these two illustrious chiefs rolled the chariot of victory over its surface, and, missing each other, severally conquered every other opponent till their mutual renown filled the world, and Europe, in breathless suspense, awaited their conflict on the shore of a distant land. From the earliest times, the inhabitants of the Peninsula have been distinguished by a peculiarity of military character and mode of conducting war which is very remarkable. Inferior to many other nations in the firmness and discipline with which they withstand the shock of battle, they are superior to them all in the readiness with which they rally after defeat, and the invincible tenacity with which they maintain a contest under circumstances of disaster, when any other people would succumb in despair. In vain are their armies defeated and dispersed, are their fortresses taken, their plains overrun, their capital subdued: singly, or in small bodies, they renew the conflict; they rally and reunite as rapidly as they disperse; the numerous mountain chains which intersect their country afford a refuge for their broken bands; their cities make a desperate, though insulated defence; and from the wreck of all regular or organised opposition emerges the redoubtable Guerilla warfare. 'Prælio victi Carthaginenses,' says Livy, 'in ultimam Hispaniam oram, ad oceanum, compulsi erant, disparem autem; quod Hispania, non quam Italia modo, sed quam ulla pars terrarum bello reparando aptior erat, locorum hominumque ingenio. Gens nata instaurandis reparandisque bellis brevi replevit exercitum, animosque ad tentandum de integro certamen fecit.' It is a singular fact, strikingly illustrative of the durable influence of common descent and physical circumstances on national character through all the varieties of time, religion, and political condition, that the system of warfare thus deemed peculiar to Spain, of all nations in the world, in the days of Scipio and Sertorius, has continued to distinguish its inhabitants, without any interruption, to the present time: that it was pursued, without intermission, for eight hundred years in their wars with the Moors; formed the leading characteristic of the struggle with Napoleon; and continues, at this hour, to be the leading feature of the savage contest between the aristocratic and democratic parties which has for so many years bathed the Peninsula in blood. Durable characteristics of this kind attaching for ages to a nation, though its inhabitants have in the course of them become the mixed progeny of many different races of mankind, will invariably be found to arise from some peculiarity in its physical circumstances, which has imprinted a lasting impress on all its successive inhabitants. This is, in an especial manner, the case with Spain and Portugal. Their territory differs in many important particulars from any in Europe. Physically considered, it belongs as much to Africa as Europe: the same burning sun parches the mountains and dries up the valleys of both; no forests clothe their sides; naked they present their arid fronts to the shivering blasts of the north and the scorching rays of a tropical sun. Vegetation, in general, spreads in proportion only as irrigation can be obtained; aided by that powerful auxiliary, the steepest mountain sides of Catalonia and Arragon are cut into terraces, and clothed with the most luxuriant

vegetation: without it, vast plains in Leon and the Castiles are almost entirely destitute both of cultivation and inhabitants. So extensive, in consequence, are the desert tracts of Spain, that the country, viewed from the summit of any of the numerous mountain ridges with which its inland provinces are intersected, in general exhibits only a confused group of barren elevated plains and lofty naked peaks, intersected here and there by a few glittering streams flowing in deep valleys, on the margins of which alone are to be seen crops and flocks, and the traces of human habitation. The whole country may be considered as a vast mountainous promontory, which stretches from the Pyrenees to the southward, between the Atlantic and the Mediterranean sea. On the shores of the ridge, to the east and west, are plains of admirable fertility, which, at no distant period, have been submerged by the waves of the sea; but in the interior an elevated assemblage of mountain ridges and lofty desert plains is to be found, in the centre of which Madrid is placed in an upland basin, at a height of eighteen hundred feet above the level of the sea. The great rivers, in consequence, flow for the most part to the east and west, in long courses; and are fed by tributary streams, which meander at the bottom of ravines of surpassing depth, shut in often by precipitous banks, or very steep declivities. Three great *chaussées* only, viz. those leading from Madrid to Bayonne by the Somo-Sierra pass, that to Valencia, and that to Barcelona, intersect this great desert central region; in every other quarter the roads are little better than mountain paths, uniting together towns built for the most part on the summit of hills, surrounded by walls environed by superb olive woods, but having little intercourse either with each other or the rest of Europe. It may readily be imagined what extraordinary advantages a country of such natural strength and character must afford to insulated and defensive warfare. In almost every quarter it is intersected by long, rocky, and almost inaccessible mountain chains, which form a barrier between province and province, almost as complete, not merely to hostile armies, but even the inhabitants of the country, as that interposed by the Alps or the Pyrenees. Branching out from the great chain which separates France from Spain, one vast mountain ridge runs to the westward, forming, in its course, the Alpine nests and inaccessible retreats of Asturias and Galicia; while another, stretching to the eastward, covers, with its various ramifications, nearly the whole of Catalonia, and encloses, in its bosom, the admirable industry and persevering efforts of its hardy cultivators. In the interior of the ridges which descend from the crest of the Pyrenees to the long vale of the Ebro, are formed the beautiful and umbrageous valleys of Navarre and Biscay, where, in mountain fastnesses, and amidst chestnut forests, liberty has for six hundred years diffused its blessings, and the prodigy has been exhibited, of independent privileges and democratic equality having been preserved untouched, with all their attendant security and general comfort, amidst an otherwise despotic monarchy. Beyond the Ebro, one great mountain range, stretching across from the frontiers of Catalonia to the neighbourhood of Lisbon, forms the almost impassable barrier between the valleys of the Tagus and the Douro, and the provinces of Old and New Castile, Leon, and Estremadura. Its western extremity has been immortalised in history: it contains the ridge of Busaco, and terminates in the rocks of Torres-Vedras.

Another, taking its rise from the high grounds which form the western limit of the plain of Valencia, extends in a south-westerly direction to Cape St. Vincent, in the south of Portugal, and separates, in its course, the outlines of the Tagus and the Guadiana. A third, also reaching in the same direction across the whole country, forms the boundary between the valleys of the Guadiana and the Guadalquivir, under the name of the Sierra-Morena; divides the province of New Castile from that of Andalusia; and has been immortalised by the wanderings of the hero of Cervantes: while a fourth, detached by itself in the southern extremity of the Peninsula, forms the romantic mountains of Ronda, whose summits, wrapped in perpetual snow, withstand the genial sun which ripens oranges and citrons, and all the productions of Africa on their sides. Two great and rich alluvial plains alone are to be found in Spain, the character of whose inhabitants differs from that of all the rest of the Peninsula: in the first of which, amidst water-melons, luxuriant harvests, and all the richest gifts of nature, the castanets and evening dances of the Valencians recall the unforeseeing gaiety of tropical regions; while, in the second, the indolent habits, fiery character, and impetuous disposition of the Andalusians attest, amidst myrtle thickets, the perfume of orange groves, and the charms of a delicious climate, the undecaying influence of Moorish blood and Arabian descent. Spain has never been remarkable for the number or opulence of its towns: Madrid, Cadiz, Valencia, Barcelona, and Bilbao, the largest of which, after the capital, does not contain above eighty thousand inhabitants, alone deserve the name of cities.\* But it has in every age been distinguished beyond any other country recorded in history, by the unconquerable resolution with which their inhabitants have defended their walls, even under circumstances when more prudent courage would have abandoned the contest in despair. The heart of every classical scholar has thrilled at the fate of Numantia, Saguntum, and Astapa, whose heroic defenders preferred perishing, with their wives and children, in the flames, to surrendering to the hated dominion of the stranger; and the same character has descended to their descendants in modern times. With invincible resolution Barcelona held out for its rights and privileges, after Europe had adjusted its strife at Utrecht, and England, with perfidious policy, had abandoned her Peninsular allies to the arms of their enemies. The double siege of Saragossa, the heroic defence of Gerona, the obstinate stand at Roses, have put the warriors of northern Europe to the blush, for the facility with which they surrendered fortresses to the invader, incomparably stronger and better provided with arms and garrison; while Cadiz, alone of all European towns, successfully resisted the utmost efforts of the spoiler, and, after a fruitless siege of two years, saw the arms even of Napoleon roll back. The peculiar political constitution of the Spanish monarchy, and the revolutions which its inhabitants have undergone in the course of ages, have been as favourable to the maintenance of a defensive and isolated internal, as they were prejudicial to the prosecution of a vigorous external warfare by its government. Formed by the amalgamation, at various times, of many different nations, of separate descent, habits, and religion, it has never yet attained the vigour and unity of a homogeneous monarchy. Its inhabitants are severed from each other,

\* "Madrid contained, in 1808, 130,000 inhabitants.—*Edin. Gazetteer, Art. Madrid.*"

not only by desert ridges or rocky sierras, but by original separation of race and inveterate present animosity. The descendants of the ancient inhabitants of the Spanish soil are there, mingled with the children of the Goth, the Vandal, and the Roman; with the faithlessness of Moorish, or the fire of Arabian descent. These different and hostile races have never thoroughly amalgamated with each other: for many centuries they maintained separate and independent governments, and kept up prolonged and bloody warfare with each other; and when, at length, they all yielded to the arms and the fortune of Ferdinand and Isabella, the central government neither acquired the popular infusion nor the inherent energy which is necessary to mould out of such discordant materials a vigorous state. The example of Great Britain, where the various and hostile races of the Britons, the Saxons, the Danes, Scots, and Normans, have been, at length, blended into one united and powerful monarchy, proves that such an amalgamation is possible; that of Ireland, where the Saxon and the Gael are still in fierce and ruinous hostility with each other, that it is one of the most difficult of political problems. Without the freedom of the English constitution, which unites them by the powerful bond of experienced benefits and participated power, or the crushing vigour of the Russian despotism, which holds them close in the bands of rising conquest, it is hardly possible to give to such a mixed race the vigour of homogeneous descent. In Spain this had never been attempted. The Arragonese were jealous of the Catalonians; the Castilians despised the Valencians; the Gallicians even were at variance with the Asturians; and the freeborn mountaineers of Navarre and Biscay had their local antipathies; while all the inhabitants of the north regarded as an inferior race the natives of Grenada and Andalusia, where Moorish conquest had degraded the character, and Moorish blood contaminated the descent, of the people; and where, amidst orange groves, evening serenades, and bewitching forms, the whole manly virtues were thought to be fast wearing out under the enervating influence of an African sun. But while these circumstances were destructive to the external vigour and consideration of the Spanish monarchy, they were, of all others, those best calculated to enable its inhabitants, when deprived of their central government and left to their own guidance, to oppose a formidable resistance to the invader. When deprived of the directions of their sovereign, the provinces of Spain did not feel themselves powerless, nor did they lose hope because it was abandoned by those who were their natural protectors. Society, when resolved into its pristine elements, still found wherewithal to combat; the provinces, when loosened or severed from each other, separately maintained the contest. Electing juntas of government, and enrolling forces on their own account, they looked as little beyond their own limits as the Swiss peasants, in former times, did beyond the mountain ridges which formed the barriers of their happy valleys. If this singular oblivion of external events, and concentration of all their energies on local concerns, was destructive in the end to any combined plan of operations, and effectually prevented the national strength from being hurled, in organised and concentrated masses, against the enemy, it was eminently favourable, in the first instance, to the efforts of tumultuary resistance, and led to the assumption of arms, and the continuance of the conflict, under circumstances when a well-informed central government would probably have resigned it in

despair. Defeats in one quarter did not lead to submission in another; the occupation of the capital, the fortresses, the military lines of communication, was not decisive of the fate of the country; as many victories required to be gained as there were cities to be captured or provinces subdued; and, like the Anglo-Saxons, in the days of the English heptarchy, they fought resolutely in their separate districts, and rose up again in arms when the invader had passed on to fresh theatres of conquest."

#### Ernest Maltravers.

[Second notice.]

WE do not appreciate Mr. Bulwer's genius without reference to its past; we must look both to its progress and its fertility. One work has been the brilliant arch that carried on to another; each more lofty and more finished than its predecessor. The gay sarcasm, the lively panorama of the present, in "Pelham," was followed by the poetry of "The Disowned," and the philosophy of "Devereux;" then came the striking and dramatic story of "Eugene Aram," followed by the picturesque beauty of "The Last Days of Pompeii," and the epic loftiness of "Rienzi." These were *companioned* by a volume demanding the labour and the thought of years—namely, "The History of Athens;" and now we have a work to which Mr. Bulwer might safely entrust his entire fame. It is the moral investigation of to-day. *Ernest Maltravers* is the ideal of the highest order of genius that can belong to our age—poetry associated with philosophy. He is surrounded by a lower class of beings, to whom he refers, and for whom he works; he is apart, but not separated; the mind is of a higher order, but its labours are among the material by which it is surrounded. It has lofty aims and glorious hopes, but actual purposes and positive results. We shall, however, defer the complete examination of genius, as embodied in *Ernest Maltravers*, till the picture be entire. In the meantime, we cannot but dwell on the high finish of the subordinate characters. The reality strikes even the most careless reader; but it is not till we minutely investigate, that we see how acute must have been the observation, how nice the discrimination, that could thus detect and blend the finer shades, and all that subtle and contradictory machinery which makes up the individual. Mr. Templemore, shrewd, yet narrow-minded—worldly, yet sectarian—self-indulgent, yet strict—still, with one sweet redeeming emotion, like a good angel at his side—his affection for the orphan child. Cleveland, though made up of less contradictory substances, is another admirable sketch; but Lumley Ferrers is a masterpiece of art. The villain, with dark hair, a sallow complexion, and a scowl, is of the ordinary stamp; but he who "can smile, and murder while he smiles," a sort of man who would wear his dagger in the worsted comforter round his neck, requires the deepest knowledge of human nature to detect and to depict. We know nothing more perfect in their way than the following preparations for making a career in life:—

*The World.*—"The tench, no doubt, considers the pond in which he lives as the Great World. There is no place, however stagnant, which is not the great world to the creatures that move about in it. People who have lived all their lives in a village still talk of the world as if they had ever seen it! An old woman in a hovel does not put her nose out of her door on a Sunday without thinking she is going amongst the pomps and vanities of the great

world. *Ergo*, the great world is to all of us the little circle in which we live. But as fine people set the fashion, so the circle of fine people is called the Great World, *par excellence*. Now, this great world is not a bad thing when we thoroughly understand it; and the London great world is at least as good as any other. But, then, we scarcely do understand that or any thing else in our *beaux jours*—which, if they are sometimes the most exquisite, are also often the most melancholy and the most wasted portion of our life. Maltravers had not yet found out either the set that pleased him or the species of amusement that really amused; therefore, he drifted on and about the vast whirlpool, making plenty of friends; going to balls and dinners; and bored with both, as men are who have no object in society. Now, the way society is enjoyed is to have a pursuit, a *métier* of some kind, and then to go into the world, either to make the individual object a social pleasure, or to obtain a relaxation from some toilsome avocation. Thus, if you are a politician, politics at once makes an object in your closet, and a social tie between you and others when you are in the world. The same may be said of literature, though in a less degree; and though, as fewer persons care about literature than politics, your companions must be more select. If you are very young, you are fond of dancing; if you are very profligate, perhaps, you are fond of flirtations with your friend's wife. These last are objects in their way; but they don't last long, and, even with the most frivolous, are not occupations that satisfy the whole mind and heart, in which there is generally an aspiration after something useful. It is not vanity alone that makes a man of the *mode* invent a new bit, or give his name to a new kind of tilbury; it is the influence of that mystic yearning after utility, which is one of the master-ties between the individual and the species. Maltravers was not happy—that is a lot common enough; but he was not amused—and that is a sentence more insupportable. He lost a great part of his sympathy with Cleveland, for, when a man is not amused, he feels an involuntary contempt for those that are. He fancies they are pleased with trifles which his superior wisdom is compelled to disdain. Cleveland was of that age when we generally grow social—for by being rubbed long and often against the great loadstone of society, we obtain, in a thousand little minute points, an attraction in common with our fellows. Their petty sorrows and small joys—their objects of interest or employment, at some time or other have been ours. We gather up a vast collection of moral and mental farthings of exchange; and we scarcely find any intellect too poor but what we can deal with it in some way. But, in youth, we are egotists and sentimentalists, and Maltravers belonged to the fraternity who employ

'The heart in passion and the head in rhymes.'

*Beginning a Public Career as a respectable Man.*—"There is nothing respectable in lodgings and a cab," said Ferrers to himself—(that 'self' was his grand confident!) 'no thing stationary. Such are the appliances of a here-to-day-gone-to-morrow kind of life. One never looks substantial till one pays rates and taxes, and has a bill with one's butcher!' Accordingly, without saying a word to any body, Ferrers took a long lease of a large house, in one of those quiet streets that proclaim the owners do not wish to be made by fashionable situations—streets in which, if you have a large house, it is supposed to be because

you can afford one. He was very particular in its being a respectable street—Great George Street, Westminster, was the one he selected. No frippery or baubles, common to the mansions of young bachelors—no buhl, and marquetry, and Sevres china, and cabinet pictures, distinguished the large dingy drawing-rooms of Lumley Ferrers. He bought all the old furniture a bargain of the late tenant—tea-coloured chintz curtains, and chairs and sofas that were venerable and solemn with the accumulated dust of twenty-five years. The only things about which he was particular, were a very long dining-table that would hold forty, and a new mahogany sideboard. Somebody asked him why he cared about such articles. 'I don't know,' said he, 'but I observe all respectable family men do—there must be something in it—I shall discover the secret by and by.'

"His plan for winning Templeton's esteem and deference was, however, completely triumphant. He took care that nothing in his *ménage* should appear 'extravagant'; all was sober, quiet, and well-regulated. He declared that he had so managed as to live within his income; and Templeton, receiving no hint for money, nor aware that Ferrers had on the Continent consumed a considerable portion of his means, believed him. Ferrers gave a great many dinners, but he did not go on that foolish plan which has been laid down by persons who pretend to know life, as a means of popularity; he did not profess to give dinners better than other people. He knew that, unless you are a very rich or a very great man, no folly is equal to that of thinking that you soften the hearts of your friends by soups *à la bisque*, and Vermouth wine at a guinea a bottle! They all go away, saying, 'What right has that d—d fellow to give a better dinner than we do? What horrid taste—what ridiculous presumption!' No; though Ferrers himself was a most scientific ecure, and held the luxury of the palate at the highest possible price, he dieted his friends on what he termed 'respectable fare'. His cook put plenty of flour into the oyster-sauce; cod's head and shoulders made his invariable fish; an four *entrées*, without flavour or pretence, were duly supplied by the pastrycook, and carefully eschewed by the host. Neither did Mr. Feers affect to bring about him gay wits and brilliant talkers. He confined himself to men of substantial consideration, and generally took care to be himself the cleverest person present; when he turned the conversation on serious matters crammed for the occasion—politics, stock, commerce, and the criminal code. Pruning his gaiety, though he retained his frameship, he sought to be known as a highly informed, pains-taking man, who would be sure to rise. His connexions, and a certain nameless arm about him, consisting chiefly in a pleasant countenance, a bold yet winning candour, the absence of all *hauteur* or pretence, enabled him to assemble round this plain table, which it gratified no taste, wounded no self-love, sufficient number of public men of rank, and eminent men of business, to answer his purpose. The situation he had chosen, so near the house of parliament, was convenient to politicians, and, by degrees, the large dingy drawing-room became a frequent resort for public men to talk over those thousand underplots by which party is served or attacked. Thus, thought in parliament himself, Ferrers became insensibly associated with parliamentary men and things; and the ministerial party, whose politics he espoused, praised him highly, made use of him, and meant, some day or other, to do something for him."

## MISCELLANEOUS.

*The Nature and Treatment of the Diseases of the Heart; with some New Views on the Physiology of the Circulation.* By James Wardrop, M.D., &c. &c. Part I. London, 1837. Churchill.

THE name of Dr. Wardrop is too familiar to the profession to require almost any comments upon any new contribution which he may pen to science; but the present work is recommended by a clearness of argument, and brevity of elucidation, which render it peculiarly available both to the student and the practitioner. The new views appear to be, that the muscles, not of the heart, but of the whole body, besides being the active organs of locomotion, perform the important office of increasing the quantity of arterial as well as of venous blood within the cavities of the heart; that the lungs regulate the supply of blood to the heart, so as to prevent congestion within the heart's cavities; and that the subcutaneous veins, performing the office of a reservoir, prevent congestion of blood within the pulmonary vessels. These considerations, connected with the action of the heart, are certainly of high importance in explaining many phenomena both of the respiratory and circulating organs; and, we have no doubt, will meet with the attention to which they are entitled, from those to whom they are more particularly addressed.

*Wisbaden recommended to the Gouty and Rheumatic.* Pamphlet, pp. 28. London, Ridgway and Sons.

THERE is no quackery about this little book; it is a work of mere philanthropy, and therefore deserves well at our hands. The author recommends a visit to Ems, followed by a short season at Wisbaden, as an infallible cure for even advanced stages of gout. We only regret that the directions are so long that we cannot introduce them here; but the pamphlet exists for those who are interested. By the by, Dr. Granville attributes the efficacy of the above water in gouty cases to the absorption through the skin of large quantities of carbonate of soda, and recommends Icelplitz as still more efficacious than Wisbaden, on this account. The use of soda in these affections has been long known to the profession; and, where it has failed in its internal exhibition, it would always be well to try the same medicament in an artificial bath.

*The Bench and the Bar.* By the Author of "Random Recollections of the Lords and Commons," &c. &c. 2 vols. 12mo. London, 1837. Colburn.

INTENDED by himself as a companion to the writer's preceding publications, we at once grant the title of these volumes to that classification. The commodity is exactly of the same quality; and, like Peter Pindar's razors, equally made to sell. All our principal legal authorities are described as they have appeared to the author's eye and apprehension. He of necessity relates a multitude of things which belong to a period antecedent to his advent to London, for its future illumination, and which must, consequently, rest on the high authority of rumour; and he also relates a multitude of things within his own cycle of time, which bespeak great ignorance of real facts. The information throughout is most superficial, and errors abound in every part, the accuracy of which we have it in our power to test from our personal knowledge. As for opinions, we must leave them to the public: only we consider many of them to be exceedingly impudent. A cat may look at a king, without offence; but it

is not every man who is competent to sit in judgment on our judges, dissect the talents of the counsel, in every court and branch of law and equity, supply a just estimate of the legal characters on the bench and at the bar, appreciate their public and private endowments, and decide, *ex cathedra*, alike on their capacity for professional duties and their social and personal qualifications. Least of all do we think this author fitted for such a task.

*The Chess-Board Companion; containing the Laws of the Game: the Value and Power of the Pieces: remarks on the most approved Methods of Beginning the Game: with numerous Examples, &c.* Written expressly for the use of beginners, &c. &c. By W. Lewis. Pp. 111.

THIS little book is all that could be wished on the subject. Though not exactly beginners, but second, or rather, perhaps, third-rate players of many years standing, we find it an excellent companion and clear instructor; what, indeed, was to be expected from the high authority and practical knowledge of Mr. Lewis.

*Original Geometrical Illustrations; or, the Book of Lines, Squares, Circles, Triangles, Polygons, &c.* By John Bennett, Engineer. 4to. pp. circ. 60. London, 1837. Bennett; Simpkin and Marshall; Sherwood and Co.; Weale; Williams; Taylor.

A WORK which cannot fail to be of value to artists, architects, engineers, and other professional men. Its object is to demonstrate easy and practical means by which every figure may be altered, diminished, or expanded; and the engravings, which help out the author's reasoning, are numerous and scientific.

*Martin's British Colonial Library.* 2 vols. (London, Whittaker.)—These volumes are a reprint of the useful and excellent account of the British possessions in the Indian and Atlantic oceans, including Ceylon, Singapore, the Falkland Isles, St. Helena, Sierra Leone, the Gambia, &c. &c. In this new, cheap, and convenient shape, they are most deserving of public favour. The whole republication is now completed in ten volumes.

## ARTS AND SCIENCES.

## GEOLOGICAL SOCIETY.

(JUNE 14, continued from No. 1077, Sept. 9.) A paper by Professor Sedgwick and Mr. Murchison, 'On the Geology of Devonshire,' began on the 31st of May, was concluded. Chap. I. After a few preliminary observations, the authors proceeded to describe the general structure of Devonshire, which they consider as divided into five distinct geological regions. 1. The first region extends through the most eastern provinces of the county, and is principally occupied by formations of new red sandstone and green sand. Chap. II. 2. The second region occupies the most northern portions of the county. But the authors commence with a description of the rocks in the north-west corner of Somerset, which are identical in structure with a part of the region here described. They divide them into two great groups: the lower group abounding in a coarse arenaceous rock (greywacke), often of a red colour, and sometimes variegated; the upper containing some beds of like character, but abounding more in rotten, thin-bedded slates (shillott), in which some portions are highly calcareous, and pass into irregular bands of limestone, and contain encrinural stems and obscure traces of organic remains. They then go on to describe the successive groups occupying the region of North Devon, and by help of natural sections (from the coast to the north boundary of the culm measures) prove that there is an enormously

thick ascending series of rocks, interrupted, however, by numerous contortions, and by a great anticlinal line ranging with the strike of the beds, about west by north, or west north-west. This line runs into the sea a little south-west of Linton, and, in consequence, one of the great groups is repeated twice over: first on the coast north-east of Linton, and secondly on the coast extending from the Valley of Rocks to Combe Martin. The lowest rocks in North Devon are in the denudation of the Lyme river, which nearly defines the position of the anticlinal region; and from the south side of that river to the culm measures is an ascending section, interrupted only by local contortions. The authors then describe the groups of the ascending section. 1. Lowest group: Valley of Rocks and Gorge above Linton. Here the structure is very varied; coarse and arenaceous, or passing into fine schist. Casts of organic remains and impressions of shells are not unfrequent, and near them the beds become calcareous. 2. The preceding passes by almost insensible gradations into the great red arenaceous groups, of which the coarser beds are commonly red or variegated; among them, however, are gray and greenish gray beds; and, as might be expected, the colours are inconsistent. Oxide of iron traverses some portions in thin veins, and is quarried in some parts, as near Combe Martin, and smelted in the iron-foundries. The slaty cleavage, transverse to the bedding, and seen in the preceding group, almost disappears among these rocks, but they are much intersected by joints. 3. The next group has few of the coarse siliceous sandstones, wants the red colour, abounds in bands of rotten slate, frequently greenish and chloritic, and also contains many calcareous bands, as well as numerous organic remains. 4. This group the authors divide into two portions, the lower abounding in fine, glossy, chloritic schist, much contorted, and having a true cleavage transverse to the bed, and generally presenting a succession of parallel fissile planes, dipping at a high angle to the south; the upper beds containing similar masses, alternating with coarse, thick, arenaceous bands. 5. The last group is composed of arenaceous flag-stones and soft earthy slates, alternating with harder and coarser bands; it conforms to the mineral type commonly found in the lowest parts of the silurian system, has abundance of organic remains, and is in parts calcareous. The group is several thousand feet thick, and, though much contorted, at length dips regularly under the base of the culm measures. Impressions of plants having been discovered in the sandstones of this division, by Major Harding and the Rev. D. Williams, Professor Lindley is of opinion, that none of these plants are similar to those which are described in the sequel as common to the culm measures. Chap. III. The deposits of the fourth division are determined by help of sections; one from Dartmoor to the coast of Torbay; another from Torbay to Start Point; and a third from Dartmoor to Bolé Head; and they divide these into the following groups, beginning, as before, with the lowest. 1. An ill-defined group near the granite, supposed to be metamorphic. 2. A great complex slate group with two subordinate calcareous zones: the lower, called the Ashburton bands, pass into Cornwall, and the upper are represented by the Plymouth and Torbay limestones. 3. A coarse red arenaceous group, which immediately surmounts these. 4. A great schistose deposit, striking (like the other rocks in the southern region) nearly east and west, dip south, but

afterwards north. 5. Mica slate. In conclusion, the authors contrast the above two regions. In the southern, trap rocks appear occasionally; in the northern, they are wanting, while the slaty cleavage, so common in the northern, is wanting in the southern region. They consider all the above groups of North and South Devon to be newer than the rocks of Snowdon and Central Cumberland (lowest Cambrian system), and older (with a very limited exception in North Devon) than the silurian system. The organic remains of the lower fossiliferous strata of South Devon are so dissimilar from those of the silurian system, that they cannot have been formed in that era. Chap. IV. The authors, in connexion with the culmiferous series of the third region, describe sections to prove that the culm measures occupy a great trough, and dip away on both sides from the other rocks with which they are in contact; hence the culm measures, whatever their age, are the newest stratified deposits described in detail. Along their northern boundary they rest on the highest group described in Chap. II. Along their southern boundary they partly rest on the granite and partly on the oldest slate rocks of Devon and Cornwall: hence they cannot form (whatever be the mineralogical appearance) a true passage into the schistose masses which they overlie. Again, they are overlaid by no rocks older than the new red sandstone; their age, therefore, can only be determined by their structure and organic remains. The plants of the culm-bearing measures differ essentially from those found in the older rocks, and are all identical with those species which are most abundant in the coal-fields of the central counties of England, and in the South Welsh basin, among which *Cyperites bicarinata*, *Neuropteris cordata*, *N. gigantea*, *Pecopteris lonchitica*, and *P. abbreviata*, are, perhaps, the most widely distributed. In their lithological aspect, also, and in containing vast quantities of small sedgelike vegetables, these plants, bearing strata of Devon, are undistinguishable from the coal measures of Pembrokeshire. The subjacent black limestone has, indeed, no exact parallel in England; its organic remains being, for the most part, peculiar and undescribed: they are all, apparently, of marine origin. Chambered shells also occur, which are considered to be *Goniatites*, a genus which has never yet been found in the silurian or older rocks, but is most characteristic of the carboniferous system. Though the authors consider the base line of the series as in a position not yet completely ascertained, they distinctly prove that it never passes down into the older rocks on which it rests; but, as in the upper group there is a fine series of vegetable fossils, every one of which agrees specifically with true carboniferous plants, they have no hesitation in placing the culm measures of Bideford on the same parallel with the true carboniferous series of Great Britain. Chap. V. The jointed structure of the granite of Dartmoor is described in detail, and the joints in their direction are shown to agree with those described by geologists in Cornwall; and the authors confirm a remark of Dr. Boase, that the same master-joints often affect the granite and bedded rocks near them: they shew that the granite has, in some places, broken through the stratified formations without very much changing their strike. In all such cases the beds are changed in structure near the granite; the silicious beds being converted into quartz rock, the shales into Lydian stone, felspar, porphyry, &c.

They regard these facts as perfect proofs of the metamorphic nature of the rocks in contact with the granite of Devon. Lastly, they describe granite veins and elvan dykes as traversing the culm measures.—The next paper read, was on the upper formations of the new red system in Gloucestershire and Warwickshire; shewing that the red (saliferous) marls, with an imbedded zone of sandstone, represent the keuper or marnes irisées, and that the underlying sandstone of Ombeley, Bromsgrove, and Warwick, is part of the "bunter sandstein," or "grès bigarré" of foreign geologists, by R. J. Murchison, Esq. V.P.G.S. and H. C. Strickland, Esq. F.G.S. Mr. Murchison having previously shewn that the system of new red sandstone, in the central counties of England, is divisible into four formations: 1. Marls with salt and gypsum, and one included band of sandstone (foreign equiv. keuper or marnes irisées); 2. Quartzose sandstones (bunter sandstein, or grès bigarré); 3. Calcareous conglomerate, representing the magnesian or dolomitic conglomerate (zechelstein, &c.); 4. Lower new red sandstone (rotte todte liegende); proceeds, in the present communication, to mark with precision the distinctive characters of the two upper formations, describing the rocks in descending order. 1. Red and green marls and sandstone (keuper).—This formation includes all the marls which lie between the lowest beds of lids and the uppermost strata of the underlying formation of sandstone, which is peculiar in nature, and appears to have escaped the notice of former observers. Tracing this rock from the borders of Gloucestershire, through Worcestershire into Warwickshire, the authors shew, by various sections, that this band, which never exceeds forty feet in thickness, invariably occupies the same position. The lower beds are sometimes (as at Inkberrow) sufficiently thick-bedded to be used as building stones (but the flaglike character prevails), tombstones, &c. Small bivalv shells, ichthyodorulites, and teeth of fishes, are foot-marks of a saurian, have been observed. The marls beneath the sandstone are of great thickness, and, besides gypsum, contain masses of rock-salt, and are the sources of brine springs. New red sandstone (bunter sandstein, grès bigarré).—The upper beds of this arenaceous formation, rising from beneath the marls, are usually light-coloured, but varying to greenish gray and red. This sandstone is lithologically distinguishable from the overlying keuper sandstone, in being softer, much thicker bedded, and more micaceous. This sandstone contains many plants which are too imperfect to be identified, but Dr. Lindley has recognised the strobilus of an *echinostachys* which M. Ad. Brongniart has figured as peculiar to the grès bigarré. As these fossils bear no affinity to the well-known plants of the Keuper, but have, on the contrary, a strong resemblance to the flora of the grès bigarré, the authors conceive that this light-coloured sandstone of Worcestershire forms part of the same deposit. Portions of bones of saurians in a mutilated state, abound in what the workmen call the dirt-bed of the Warwick sandstone; plants also occur. In addition to the fossils collected by Dr. Buckland, the authors have found the teeth of fishes. As the animals found in Guy's Cliff has not been proved of the same species as either of the phytosauri of the keuper of Wirtemberg; the authors conjecture that, if ever accurately determined, it will prove of the same species as one of the saurians in the bunter sandstein of the Continent. No traces have been observed of a calcareous strata-

tum between the two formations above described, which might represent the "muschelkalk," except in Shropshire, where Mr. Murchison has observed a band of very impure limestone occupying this intermediate position, but no organic remains have yet been observed in it. On the whole, the authors conclude, that the most exact parallel exists between the upper formations of the new red system of England, and those of a part of France, where the muschelkalk being also absent, the marnes irisées and grès bigarré pass into each other in the manner above described.

## LINNEAN SOCIETY.

MR. FORSTER in the chair.—This being the first meeting after the recess, there was a very full attendance of members; and the number of donations of books and specimens was more than usually great. Amongst them we noticed many splendidly illustrated works on zoology and botany, and the transactions of various foreign academies and societies. Amongst the donations to the museum, were an extensive collection of dried plants from Swan River, bequeathed to the Society by the late Alexander Collier, Esq.; and another from the interior of Brazil, presented by Charles James Fox Bunbury, Esq. F.L.S.; one of skins of quadrupeds and birds, presented by the committee of the Australian museum at Sydney; and one comprising fruits of plants, skins of quadrupeds, birds, and reptiles, from British Guiana, presented by Mr. Schomburgk. Mr. Norman exhibited British specimens of *Cantharis vesicatoria*, the blister-fly of the "Pharmacopœia;" the insect, previously considered exceedingly rare and almost doubtful as British, having appeared during the past autumn by millions in the neighbourhood of Colchester, on the ash-trees. Mr. Gould exhibited a drawing of the *Apteryx australis*, a remarkable bird related to the ostrich, from New Zealand. Mr. Anderson exhibited a plant, in full flower, of the curious *Azara integrifolia* of Rinz and Pavon, from the Apothecaries' garden at Chelsea. Mr. Pamplin exhibited a plant of the rare *Cystopteris regia*, from the original station at Low Layton, Essex; and specimens of a singular variety of the *Ophioarachnites*, with the lip of the flower almost wanting. Read, a new arrangement of the vertebrate animals, by Charles Lucien Bonaparte, prince of Musignano, For. Mem. L.S., who was present at the meeting. Read, also, Observations on the angustura bark-tree, by Dr. Hancock, communicated by the secretary. To these papers we may hereafter refer.

## ELECTRICAL SOCIETY.

On Saturday evening last, the conclusion of a paper, 'On various Electrical Phenomena, and the Circumstances attending their Production,' was read by Mr. Leithhead. In it he referred to a subject which he considered most important, and which he hoped, at no distant day, to bring before the Society, and have it in his power to illustrate experimentally, namely, the connexion which seems to exist between electricity, in its various modifications, and the gaseous elements. As the view of this subject taken by Mr. Leithhead tends to strengthen the bonds of union of the sciences, chemistry, electricity, and physiology, and suggests interesting subjects of experimental investigation, we feel pleasure in bringing it under the consideration of our scientific readers, even in its present incomplete state. Mr. Leithhead premised that there is not a single instance known of the development of electricity

without the presence of oxygen. The simple method of excitation by friction is to facilitate the combination of an oxidable body with oxygen; and such a body being present, the excitation is more energetic. The opinion of Dr. Wollaston on this point, and the experiments he adduced in illustration of his views, were quoted,—the employment of different amalgams and the greatest effect produced by that most easily oxidated; also the arrangement of a small machine in a vessel, so contrived as to allow the air it contained to be changed at pleasure. By the substitution of carbonic acid gas for common air, electrical excitement was destroyed, but immediately restored upon the re-admission of atmospheric air. The object of these experiments was, as is well known, to afford a distinct proof of the identity of the voltaic and ordinary electricity; but Mr. Leithhead stated, "he presumed to point out this distinction between what has been termed dry, or ordinary, and voltaic electricity. In both the presence of oxygen is necessary; but in the latter it seems necessary that both oxygen and hydrogen should be present, for there can be no voltaic action without moisture; and, in connexion with these facts, it is far from unworthy of notice, that, while the passage of dry electricity between two bodies is always attended by the evolution of light, the passage of voltaic electricity is usually accompanied by the evolution of heat." These facts suggest the consideration, whether "oxygen is not a compound of light and electricity combined with a base; and hydrogen, a compound of heat and electricity in combination with a base?" Upon these subjects Mr. Leithhead trusted he should have an opportunity of enlarging. In conclusion, he remarked upon the coincidence, that the presence of oxygen seems no less essential to the development of electricity than it is necessary for the support of animal life.

## MEDICO-BOTANICAL SOCIETY.

WEDNESDAY evening; first meeting of the session: Earl Stanhope, president, in the chair. On the table were some fine specimens of Turkish and Egyptian opium; also a beautiful English preparation of sulphate of quinine, by Messrs. Herring. Amongst the various plants and roots, there was one to which the chairman drew the attention of the meeting—the *Cinchu-chulli de Cuenca*, of the ipecacuanha species; administered with success in cases of elephantiasis. Its present scarcity raises its value in the country of its growth to 20 dollars an ounce. Dr. Sigmond read the introductory address, referring to the objects of the Society,—the cultivation of such indigenous plants as possessed medicinal virtues; the importation, in their purest state, of drugs, the product of foreign countries; and the means by which the adulteration of the most important therapeutic agents might be either prevented or immediately recognised: encouraging labourers in the fields of discovery: stating that vegetation in its humblest classes was most important—even from the sea-weed, which the poets of antiquity had denounced as vile "vilionalgæ," a most extensively useful principle had been obtained: enlarging upon the properties of this element, the culture of sea-weed for the production of this substance, the utility of the algæ in binding the sands of the sea, preventing the irruption of the waves, and their action upon silex, which wonderful ingredient in the stability of nature they alone dissolved, and, by dissolving, formed a vegetable mould in which future forests sprang up. Other subjects of the interesting paper were the mosses;

the lichens, the scavengers of nature, by whose action decaying matter was removed from the face of the globe; the parasitic fungi; the time and mode of gathering the ergot; the medical properties of the spurred rye, &c. &c. Thanks were voted to Dr. Sigmond, and the meeting adjourned.

## THE NEW SAFETY COACH.

THE *Literary Gazette*, No. 745, six years ago, was one of the first journals to notice, in terms of commendation, the scientific principle upon which this safety coach, as it is appropriately called, is constructed. At that time a well-executed model was exhibited in what was then denominated the National Repository, Charing Cross; and so impressed were the directors of that institution with the excellence of the invention, that they placed it first in the catalogue. Since that period, a full-sized stage-coach, on the same principle, was built at the suggestion of the post office authorities, to test by experiments the alleged safety of the vehicle. However, as is the fate of too many praiseworthy inventions at the beginning, Mr. Stafford, the patentee, did not meet with that patronage from the public which he had a right to expect. Thoroughly convinced of the incontrovertible principle of his patent, the inventor continued improving it; and, finally, assisted by two scientific gentlemen, actuated chiefly by a regard for human life and limb, another coach was built by a London maker, and started on an experimental trip to Blackheath the other day. The coach was drawn by four spirited gray horses, and dashed along at the rate of fourteen miles an hour, with eighteen literary and scientific gentlemen as passengers, besides half-a-ton of lading on the roof. At this furious rate it was driven sometimes with the off wheels on the embankments at the road-sides, and the near wheels working in the drain; yet the vehicle swerved so little, that the inside passengers were insensible of the slightest departure from the usual position. At Blackheath the experiments were absolutely frightful to the spectators; so much so that those not in the secret exclaimed that the coachman was mad, and wished to destroy both coach and passengers. The four horses were made to gallop over an abrupt eminence, two feet ten inches high: the coach described an angle of forty-five degrees with the near wheels, the off wheels being at the moment at the base; and thus, poised between heaven and earth, it maintained almost a perfect equilibrium. Now, it ought to be stated, that an eminence of six inches has, thousands of times, overturned ordinary stage-coaches. Many other tests were resorted to; and all present declared that the triumph was complete. The vehicle is built on the plan of the mail and stage-coaches; but, instead of the usual springs being placed beneath the body, and consequently below the centre of gravity, which always renders a coach liable to overturn from inequalities in the road, the body of this carriage is suspended considerably above the centre of gravitation, even when loaded with its full complement. This is effected by two upright supporters, rising from the beds and axles, and passing up between the body and the boots. The tops of these supporters are surmounted by double elliptic springs, to which is affixed one half of the shifting centre of gravity; the other half is attached to the body.

## LITERARY AND LEARNED.

UNIVERSITY INTELLIGENCE.  
CAMBRIDGE, November 1st.—The following degrees were conferred:—

*Doctor in Divinity.*—Rev. G. B. Blyth, Clare Hall.  
*Bachelor of Arts.*—T. H. Davies, Trinity Hall.  
 E. Hicks, B.A. of Corpus Christi College, Oxford, was  
 incorporated of Trinity College.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.\*

*Monday.*—Royal Geographical, 9 P.M.; Medical (second meeting), 8 P.M.  
*Tuesday.*—Society of Arts, 8 P.M. (On Calico Printing, by the Secretary); Zoological, 8 P.M. (Scientific business); Royal Medical and Chirurgical, 8 P.M.  
*Wednesday.*—Society of Arts, 7 P.M.; Geological (second meeting), 8 P.M.  
*Thursday.*—Royal Society, 8 P.M.; Antiquaries, 8 P.M.  
*Saturday.*—Electrical, 7 P.M. (Theatre, Adelade Street Gallery); Harveian (Edward Street, second meeting), 8; Westminster Medical, 8 P.M.

#### PINE ARTS.

##### BRITISH SOCIETY.

THE private view of the studies by native artists of the works of eminent masters, liberally left by their proprietors for that purpose, took place on Wednesday; and we have to regret that the intimation reached us too late, and that Thursday offered no opportunity to amend the lapse, so that we must postpone the notice till next Saturday.

##### ARCHITECTURAL SOCIETY.

OPENING meeting, Tuesday evening, Nov. 7th, for the session of 1837-1838. Mr. W. B. Clarke, president, in the chair.—Numerous drawings were exhibited by Messrs. G. Moore, H. Duesbury, G. Hawkins, W. Grillier, R. E. Phillips, &c., members. Various interesting works of art, and portfolios of drawings, were laid on the table. Some casts of arabesques, taken from the Alhambra, contributed by Mr. Owen Jones, attracted particular attention; they were exceedingly elaborate, and were elucidated by a view in outline of the interior, beautifully etched by Mr. T. T. Bury, member. The business of the evening comprised the announcement of donations to the library and museum, of the subjects for the students' prizes, and reading an address by the chairman. The conversazione was numerously attended.

#### ORIGINAL POETRY.

##### OLD DOBBIN.

HERE'S a song for old Dobbin whose temper  
 and worth [birth;  
 Are too rare to be spurn'd on the score of his  
 He's a creature of trust, and what more should  
 we heed? [the steed.  
 'Tis deeds and not blood make the man and  
 He was bred in the forest, and turn'd on the  
 plain, [and mane;  
 Where the thistle-burs cling to his fetlocks  
 All ugly and rough, not a soul could espy  
 The spark of good-humour that dwelt in his  
 eye.  
 The Summer had waned, and the Autumn  
 months roll'd,  
 Into those of stern Winter, all dreary and cold,  
 But the north wind might whistle, the snow-  
 flake might dance,  
 The colt of the common was left to his chance.  
 Half starved and half frozen, the hail-storm  
 would pelt, [felt;  
 Till his shivering limbs told the pangs that he  
 But we pitied the brute, and, though laugh'd  
 at by all,  
 We fill'd him a manger, and gave him a stall.  
 He was fond as a spaniel, and soon he became  
 The pride of the herd-boy, the pet of the dame;  
 You may judge of his fame, when his price was  
 a crown, [our own.  
 But we christen'd him Dobbin, and call'd him

\* The Astronomical met last night.

He grew out of colthood, and, lo! what a change,  
 The knowing ones said it was mortally strange,  
 For the foal of the forest, the colt of the waste,  
 Attracted the notice of jockeys of taste.

The line of his symmetry was not exact,  
 But his paces were clever, his mould was com-  
 pact;  
 And his shaggy thick coat now appear'd with a  
 gloss, [its dress.  
 Shining out like the gold that's been purged of  
 We broke him for service, and tamely he wore  
 Girth and rein, seeming proud of the thralldom  
 he bore;

Every farm has a steed for all work and all  
 hours,  
 And Dobbin, the sturdy bay pony, was ours.

He carried the master to barter his grain,  
 And ever return'd with him safely again;  
 There was merit in that, for, deny it who may,  
 When the master could not, Dobbin could find  
 his way.

The dairy-maid ventured her eggs on his back,  
 'Twas him, and him only, she'd trust with the  
 pack:

The team horses jolted, the roadster play'd  
 pranks,  
 So Dobbin alone had her faith and her thanks.

We fun-loving urchins would group by his side,  
 We might fearlessly mount him, and daringly  
 ride;

We might creep through his legs, we might plait  
 his long tail, [to fail.  
 But his temper and patience were ne'er known

We would brush his bright hide till 't was free  
 from a speck; [thick neck;  
 We kiss'd his brown muzzle, and hugg'd his  
 Oh! we prized him like life, and a heart-  
 breaking sob [dear Dob.

Ever burst when they threaten'd to sell our  
 He stood to the collar, and tugg'd up the hill,  
 With the pigs to the market, the grist to the  
 mill;

With saddle or halter, in shaft or in trace,  
 He was stanch to his work, and content with  
 his place.

When the hot sun was crowning the toil of the  
 year, [cheer;  
 He was sent to the reapers with ale and good  
 And none in the corn-field more welcome was  
 seen

Than Dob, and his well-laden paniers I ween.

Oh! those days of pure bliss shall I ever forget,  
 When we deck'd out his head with the azure  
 rosette;

All frantic with joy, to be off to the fair,  
 With Dobbin, good Dobbin, to carry us there?

He was dear to us all, ay, for many long years;  
 But, mercy! how's this? my eye's filling  
 with tears.

Oh! how cruelly sweet are the echoes that start,  
 When Memory plays an old tune on the heart.

There are drops on my cheek, there's a throb  
 in my breast, [rest,  
 But my song shall not cease, nor my pen take its  
 Till I tell that old Dobbin still lives to be seen,  
 With his oats in the stable, his tares on the  
 green.

His best years have gone by, and the master  
 who gave [the slave.  
 The stern yoke to his youth, has enfranchised  
 So browse on, my old Dobbin, nor dream of the  
 knife, [thy life.  
 For the wealth of a king should not purchase  
 E. C.

#### BIOGRAPHY.

##### JOHN LINWELL BOND, ESQ.

IT is with extreme regret that we announce the death of this highly gifted artist, and truly estimable man, who expired at his house in Newman Street, on Sunday last, after many months of great bodily weakness. As an architect, he was, in knowledge, judgment, and taste, inferior to none of his contemporaries. For examples, we may refer to his design for Waterloo Bridge, justly considered one of the finest ornaments of the metropolis, which, with all the necessary estimates, was made by him for the projector, the late Mr. George Dodd, engineer; the principal inn at Stamford, executed for Sir Gerard Noel, and many other designs prepared for the same hon. baronet, which were never carried into effect; and others, of a high character, now in possession of his brother, Mr. William Bond. Mr. Bond was well versed in classical literature; so much so indeed, that Mr. Gifford, the late editor of the *Quarterly Review*, presented him with an interleaved copy of his translation of Juvenal, in order to have the benefit of his critical remarks and annotations. In the year 1818, Mr. Bond visited Italy and Greece, and returned in 1821, amply stored with studies made in those interesting countries; of which, had he availed himself of his learning and acquirements, he might have given the modern world not only one of the earliest, but one of the best descriptions. But his retired habits, and the modesty of his disposition, rendered him averse to appear before the public, and induced him to confine his labour to the gratification and service of the few friends who had discernment enough to appreciate his merits. Among those who have benefited by his kind and able remarks on subjects connected with his profession, the Editor of the *Literary Gazette* has to acknowledge many communications which have appeared in this journal.

Mr. Bond has left behind him a translation of Vitruvius, the work of some twenty years. But all his labours are now ended. Peace to his remains! for he was one of the most peaceful and placable of mankind.

Mr. George Castles.—We have read, with much regret, in the newspapers, that this gentleman, whose medical and botanical publications have frequently received our favourable notice, put a period to his existence a few days since, at his residence, Peckham.

#### DRAMA.

*Drury Lane.*—On Monday, a tragic historical drama, called *Caractacus*, was produced here, under striking disadvantages. In the first place, public expectation had been so excited by outrageous "puffs preliminary," that nothing upon the stage could have satisfied it. Secondly, the play was murdered in the performance by almost every one of the *dramatis personae*. And, thirdly, it was a mistake to suppose that the impracticable story of *Caractacus*, however treated, could sustain a five-act melodrama of music, scenery, and machinery. Mr. Planché, whose skill and talent were employed on this abortive attempt, did all that could be done. Every act ended with a *coup de theatre*—a druid dracontium (Abury, and, by the by, rather out of *Caractacus*' way); a British fortress, Caer Caradoc; and a Roman triumph, were finales fit to carry any show-piece through; but, then, all between was deplorably heavy and dull. The people came to see a spectacle; and the beautiful language of Beaumont and Fletcher, bedevilled as it was in the delivery, was either unheard or became a

laughing-stock. The failure was consequently complete. Even as a spectacle, the thing was wretched. The British fort was stormed by the Roman *proprietor* (or, as the *claqueurs* called him, the proprietor) and four tribunes; and one battering-ram put to ignominious flight all the Britons, in their droll party-coloured sheep-skin pantaloons. Nothing could be more grotesque and ludicrous. The last scene, that for which all the rest was contrived, was a clumsy crowd, without beauty, magnificence, or taste—a mere filling of the stage with horses, asses, cars, elephants, painted people, and old parish properties. The music, by Balfe, we thought good; but the bard incantations terribly tedious. The piece was not announced for repetition; but we understand it has been cut down to three acts, and now supplies the place of D'Egville's ballet of thirty years ago, without being indebted much to Tacitus, Beaumont, Fletcher, Mason, or Planché. The only difference is that it is now shorter, and stupid without any redeeming merit.

*Covent Garden.*—On Saturday, the *Parole of Honour*, by Mr. Serle, was brought out here; and, possessing some touching incidents as well as character, and being excellently acted, it met with deserved approbation. To readers acquainted with Kotzebue's *Hugo Grotius* we need not point out how much the author is indebted to that play—so much, that we think it should have been acknowledged; for candid acknowledgment is better than questionable originality. But, passing over this little bit of theatrical expedient, we have to express our participation in the interest created, and well supported throughout, by the *Parole of Honour*. The story is of Roundhead and Cavalier, with a cross love affair, belonging to the younger branches of the families. A broken parole, the involving of innocent parties, persecution, and a timely assault, are the staples on which hinges the plot; and Miss Faucit, Miss Taylor, Bartley, Meadows, Bennett, Pritchard, &c. make so much of their parts, that every point tells, and the audience applaud to the echo.

On Monday, *Macbeth* was performed, and in a manner worthy of the national drama. It was not merely that the cast of characters was such as to delight the most critical worshippers of Shakespeare, but that every minute circumstance and accessory, as well as general scenery, costume, and effect, were attended to in a manner unrivalled even in the best dramatic times. Macready is indeed nobly redeeming his pledge to restore to us, if possible, the legitimate drama; and we rejoice to perceive that every week the public are feeling more and more the value of his exertions. But we trust this appreciation will not only grow in strength, but demonstrate itself more rapidly. It is a severe trial for an individual to fight this great battle; and nothing but prompt as well as great encouragement can enable him to fight it as he ought. The press, we grieve to remark, has, with few exceptions, been more indifferent to these efforts than we could have wished; but it was difficult, perhaps, to divest the question of the tinge of rivalry, and, therefore, the partial friends of other theatres would not consider it *per se* as a struggle to restore the sinking drama, but rather looked at it as an invasion of interests they desired to promote. This has, in some measure, retarded the triumph; but the public, even independently of the press, learns, though by slower degrees, to right itself; and Mr. Macready has only to persevere in his course, under fast-vanishing obstacles and pressure, to obtain for

himself the fame of reviving the British stage, and, with that fame, the more solid reward of successful theatrical speculation. We ought to bestow a like meed of praise and encouragement upon his fellow-labourers in this arduous task. In the *Macbeth*, Phillips, Wilson, Shirreff, P. Horton, did not disdain to take their parts; and Purcell and Locke's charming music was never heard so perfectly before. His own *Macbeth* now extorts reluctant eulogies from pens and tongues which had previously marked only its defects, without marking its features of extraordinary force and beauty. Macready may, as they think, be wrong in the conception of certain passages, and occasionally somewhat mannered in their delineation;\* but his study of a character is grand and masterly. His mind comprehends the whole, and there is no partial carelessness or error. He has imagined his model, and he works up to it with discrimination, fervour, energy, and genius. So long as men are of different opinions,—so long as the memory of a Kemble school opposes the recollection of a Kean school,—it will be impossible to please them on every point; but to us, who have from the first maintained this great actor's merits and powers, it is, at last, gratifying to find that no one denies him the highest place in his profession, but that even those who stood out longest against his Shakespeare characters, are now loud to proclaim, for instance, that much of his *Macbeth* surpasses aught they ever witnessed upon the stage. It is true; and we say so without disparagement to the illustrious performers we ourselves have seen and worshipped in personations, only, by the nature of their toil, less immortal than the author whose thoughts they embodied, and whose language they expressed. We seldom dissertate upon dramatic matters; but really, when a stand is making for the existence of the drama, we trust we shall be excused, and shall only add, that Messrs. Phelps, Warde, and Anderson, played completely up to the principal characters, and that Miss Huddart, in *Lady Macbeth*, acquitted herself in a very able manner.

*Olympic.*—*A Dream of the Future*, by Mr. C. Dance, shews us how well he has observed the past, and how good a use he can make of the present. It is a *Victorine* sort of piece, in which the young of act 1 are the old of act 2, and restored to youth again in act 3, the dream being over. Vestris (and especially in the aged character), C. Matthews, Vining, Miss Murray, Miss Lee, all act imitatively together; and if we say that this "Dream" is worthy of a place by the *Country Squire* of the same author, we have said what ought to attract houses. It might be invidious to select; but we would notice Mr. Brougham, in the Irish footman, as extremely clever. Vining and F. Matthews coloured their parts a thought deeper, perhaps, than reality, but not at all too much for an extravaganza, as this is. Vestris herself could never appear to more advantage. The scene where she coquets with her lover, sends him for her scissors, and feels mortification at his obeying her to the letter, was played with a purity and delicacy of truth and finish, inferior to nothing that we can imagine. The exquisite touch, too, of dropping her gloves when he is

\* The charges of mannerism and hardness, especially the first, are rather perplexing. No actor ever existed without a manner peculiar to himself. John Kemble, the great standard of *Macbeth* in our time, displayed much mannerism in his grand conception of it; and Kean was particularly mannered in every part he performed. With all the splendid art of the one, and all the fire and talent of the other, the spectator never lost sight of either individual. Then, with regard to hardness, which we have heard alleged against some parts of Macready's acting, it has always struck us to be, at the worst, the hardness of extreme polish.

angry, that he may pick them up (our readers will recall Napoleon in the *tête-à-tête* at Vienna, letting his hat fall before Metternich, for the same reason), as well as the—must we call it?—impudent bounce with which the fair manœuvre lays the blame on her lover, were perfectly admirable, and so was the double sleeping scene.

*The Adelphi* goes on most famously with its grand spectacle of *Valsha*, its deep interest and scenic terror; and *Rory O'More*, to back it with meriment and laughter.

*St. James's.*—The *Cabinet* has been received, and is nightly cheered with enthusiastic plaudits; and, in truth, when we listen to the magic notes of Braham in this opera, we cannot believe that five and thirty years have passed over his and our heads since first we heard him sing the matchless polacca, "No more by sorrow chased." The *Dream of the Future* may charm the *Olympic*; but there is a still more thrilling feeling attached to this *dream of the past*. Braham, being loudly called for at the close, on the night we were there, alluded to the dates we have noticed in the expression of his acknowledgments: it was very touching; and the more so to those who knew and remembered that (except Mrs. Davenport) all his compeers of that distant day are no more, while he remains in full and pristine vigour, still the brightest ornament of our English school.

#### VARIETIES.

*Zoology: Anecdotes of Animal Instinct.*—In a paper, in the June No. of the "Bibliothèque Universelle de Genève" (so ably edited by M. de la Rive, who read several papers at the recent meeting of the British Association), there are some curious anecdotes, tending to prove how near, if not quite, to the power of reasoning the actions of animals approach. Two men, who were about to walk to Vevey, agreed to meet at an appointed place. One of them, who arrived first, fancying he was too late, resolved to push on and overtake his comrade; but his dog shewed evident symptoms of disliking this proceeding. He ran backwards end forwards, lingered behind, and, at length, totally disappeared, but speedily returned with the walking-stick of the second person in his mouth. He had come late, and sat down to wait for his friend; but the sagacity of the animal resorted to this evident means of teaching them their relative positions, and bringing them together.—Another dog, which they were trying to teach to mount a ladder, got so tired of his lesson that he ran away; but next day he returned alone to the ladder, and applied himself to the task, just as if his vanity had been piqued into learning the exercise.—A third dog, taught to carry a lantern with its owner, on winter mornings before daylight, as the latter carried milk to a neighbouring farmer, happened one day to be shut up when his master departed. When loosened, he ran after and overtook him, but perceiving that he had not the lantern, he returned to the house, and causing it to be given to him, again hastened to his accustomed light work.—Another, belonging to a young student, whose master, while bathing, hid among some rushes, was hallooed into the water, as if an accident had happened; when, instead of plunging in, he ran lower down the rapid stream, and took his station, watching the river, where it was most likely to bring down the body for rescue. [This is a doubtful proof; for, if very sagacious, he would have discovered the trick. *Ed. Lit. Gas.*]—We conclude with one fact more, relating to an animal of which we have

been used to consider innocence, rather than wisdom, the characteristic. A pigeon, familiarised to the kitchen, where it was fed and caressed, one day witnessed the killing of a pullet, and it immediately flew away and never returned to the scene of slaughter! The kitchen death of a chicken is not very unlike the death of a dove; and the warning was not lost.

**Carthaginian Remains.**—The Zodiac, on her way from the African coast to Liverpool, has touched at Marseilles. She is reported to be laden with antiquities (55 cases) excavated at Carthage by Englishmen, who paid the Bey of Tunis a liberal sum for liberty to explore this memorable site; and who have been rewarded by the discovery of fine statues, mosaics, and other rich productions of art.

**Thames Tunnel.**—The public have been sorrowfully excited, during the past week, by a new irruption of the tunnel, accompanied by loss of life, and within a short period of a former one. It appears that the present irruption of the waters took place in a part where it was not expected; nor do we believe that proper means had been taken to obviate its occurrence in such a point, viz. in the central boxes of the working. We further have reason to believe, that there is on the side of the river at which the tunnel has now arrived, an old ballast-hole, which is full of soft mud, and that it extends over about 150 feet, through 50 of which the works have already been carried. By the water coming in at the middle boxes, it is plainly shewn how much below the upper part of the works this permeable bed extends. Public patience has been too long tried towards this undertaking, that we should wish to say any thing that would in any way impede its progress; but it is evident that care and precautions must be taken proportionate to the difficulties which have to be encountered.

**Falling Stars.**—We again remind our readers of these expected phenomena about the 13th. It is remarkable that M. Arago, and other astronomers in France, have already observed a sort of rehearsal of this interesting appearance one night in last week.

**Captain Back.**—Our gallant countryman has returned in good health to London, and, we trust, will be present at the Geographical Society on Monday, to receive the congratulations of his many friends—perhaps to give some account of his voyage.

**Weather Wisdom.**—Alas, alas! the 9th was rainy. It began about three o'clock, just as the Queen reached Temple Bar, and continued drizzling nearly throughout the night, and all Friday. Mr. Murphy was, therefore, only nearly right; only almost immortalised. Neither has Mr. Morrison been more happy for this much-looked-for week. The next is thus provided for. "The Sun with Saturn on 12th, brings very cold and stormy weather, with snow or violent rains. High winds and rain about the middle. Storms and snow about the 17th."

**Royal Medal.**—A medal, to commemorate the Queen's city visit on Thursday, has been published by Messrs. Griffin and Hyams. It is a crowned bust of her Majesty, and on the obverse, the Lord Mayor giving her welcome, while Britannia holds a wreath over her head, and Fame and Plenty celebrate her presence. It is by J. Barker, and befits the occasion.

**City Pageants.**—Messrs. Nichols have, most opportunely, given us, from their ample stores of antiquarian lore, a pamphlet collection of the Pageants which have, in preceding ages, enlivened and delighted the good city of London, when our sovereigns have done it the honour to accept its hospitalities. With the brilliant

spectacle of Thursday so freshly before them, all who witnessed it, and the citizens above all, must have a peculiar relish for this curious and interesting publication.

**The Fitzwilliam Museum.**—The first stone of this museum was laid, with grand masonic ceremonies, at Cambridge, on Thursday week.

**Melophonic Society.**—Under this title, Messrs. J. H. Griesbach, H. Westrop, J. Banister, J. Surman, and H. J. Banister, announce a series of meetings, by subscription, during the ensuing season, for the practice of the most classical specimens of choral and other music.

**France.**—France forms nearly a fifteenth part of Europe, and a two hundred and fortieth part of the inhabited globe. On the other hand, its population is already a seventh part of that of Europe, and a twenty-seventh part of the total population of the earth. In relation to the five European states of the first rank, the surface of France is only a fifth part smaller than that of the Austrian empire, and very nearly double that of the British in Europe and of Prussia; but it is not a seventh part of that of Russia in Europe. Its population is equal to that of Austria, exceeds the British only by a fourth, is considerably more than double that of Prussia, and surpasses half the total population of Russia.—*Statistical Journal.*—(Of which two Nos. have reached us, and for which we return our acknowledgments. They contain much useful matter).—*Ed. Lit. Gaz.*

**A Royal Discovery.**—The "Brighton Gazette" of last Thursday informs its readers, that the Queen is particularly fond of singing vocal music. As the "Brighton Gazette" has long been proverbial for the correctness of its information, we are happy, upon the faith of such undoubted authority, to give all the notoriety in our power to the fact of this her majesty's most extraordinary predilection.

**Slight Differences in Newspapers.**—An alderman of a certain metropolitan city came, some time since, very hastily into one of the reading-rooms there, for the purpose of consulting the *Courier* upon some matter of great importance to him; when, not being able immediately to find the paper he wanted, he accosted a reverend gentleman who chanced to be there, and reading the *Sun*, with, "Pray, sir, is that the *Currier* you have there?" "No, sir," replied the other, offering him the paper, "but it is the *Tanner*—won't that suit you as well?"

The same reverend gentleman was one day on board a steam-boat, in which there happened, also, to be another rev. divine, who at that time was head master of one of our largest public schools. As they approached the sea, the illustrious schoolmaster began to feel very qualmish, and at last became exceedingly ill. In one of the intervals between the paroxysms of his malady, our friend stepped up to him and said, "Why, —, I little expected this of you: I thought that you brought up nothing but young gentlemen."

**Railroads.**—A new French journal has been started in London, called "Le Miroir de Paris," which, from among its varieties in No. 1., not so suited to our system, supplies the following:—Gen. Scheffkine, aide-de-camp to the Emperor of Russia, accompanied by a young Russian *savau*, has just made a tour in the north of England, by order of his sovereign, to make himself acquainted with the construction of the railroads and the locomotive-machines. We are assured that immense railroads are about to be laid down in Russia, for which machines are to be purchased from the manufactories on the Tyne and the Wear. A similarly great work in the north of Germany is on the eve of being commenced.

\* \* The unfortunate quatrain signed "H." in our last, has caused us much trouble. *Primo*, it was vilely printed, with "hears" for "hearts," in the last rhyme, which brought H. tumbling upon our heads. *Secundo*, a dozen of correspondents have (besides the poetical reclamer we now insert) accused us of most disloyal feelings, sedition, treason, &c. &c. &c. Better judges would know, that the higher the object lowered beneath the praise of a mistress, the greater the compliment; and that a lover, in exalting his adored above all other excellence, only be-pargons her, but does not deprecate the object in comparison. At any rate, we this week give them an acrostic by way of amends. Here is the answer—

To H. \*

Who calls thee a disloyal knave,  
Not far from truth departs;  
Disdaining paltry diamonds,  
VICTORIA'S queen of hearts.

VIVE LA REINE!

And here the Acrostic—

*Impromptu on Somebody, by Nobody.*  
V ery fair and youthful maiden,  
I nnocent, sedate, and wise;  
C hoicest gifts descend to bless thee,  
T ender joys around thee rise!  
O live buds, and myrtle blossoms,  
R ose of England, suit thy mien;  
I n our hearts long gently reigning,  
A lion's loved and peerless Queen!

## LITERARY NOVELTIES.

Mr. Hood has issued his customary jocular announcement of the coming Comic Annual, in which he declines an early or contemporaneous competition with that "Splendid Annual," the Lord Mayor of London; particularly when he is coming out, with extraordinary embellishments, under the especial patronage of Her Most Gracious Majesty, the Queen; and requests his publishers to chain up their circulars, muzzle their paragraphs, hoard their puffs, save their chalk, &c. and all the other immodestities that modest merit is compelled to omit in this age of speaking trumpets and gongs, till after the gorgeous solemnity. He also intimates some little German whims and oddities during a halt by the Rhine, and a march with a Prussian regiment, as being in a fair way for getting on box-wood, and into paper and print.

The *Bijou Almanack* for 1838 is announced with such features of novelty and curiosity, as to promise, we think, an improvement upon its two popular precursors. A small tome, it is true, but with great pains bestowed upon it. *Peter King*, a Romance by M. Mars, is promised the Parisians, as the most perfect picture of English manners.

## LIST OF NEW BOOKS.

The Keepsake for 1838, with Engravings executed under the superintendence of Mr. Charles Heath, super-royal 8vo. 2s.; India proofs, 2s. 12s. 6d.—Nichols' London Pageants, 8vo. 2s. 6d.—The Christmas Library, 1838: Birds and Flowers, by Mary Howitt, 12mo. 6s.—The Child's Own Story-Book, by Mrs. Jerram, 3s. 6d.—C. Kennell's Poems of Declaration, &c., 8vo. 12s.—Practical Surgery, by R. Liston, with 120 Engravings, 8vo. 22s.—Lewis's Chess-board Companion, 18mo. 2s. 6d.—Horace, by E. Harwood, 18mo. 2s. 6d.—Chitty's and Holmes' Collection of Statutes, with Notes: 10 Geo. IV. to 1 Vict. Vol. II. (in 2 parts), royal 8vo. 2s. 12s. 6d.—The Law of Wills, as altered by 1 Vict. c. 26, by H. Sugden, 8vo. 8s.—The Infant Saviour, &c. &c., by Krummacher, 18mo. 1s. 6d.—Hamard's Parliamentary Debates, Vol. XXXVIII. 8vo. 2s. 2s.—Boyle Lectures, &c., by Bentley, forming Vol. III. of the Works edited by Dyce, 8vo. 14s.—Rev. Dr. Hale's Discourses on the Liturgy, by the Rev. J. A. Giles, 3 vols. 8vo. 36s.—Prof. Silliman's Consistency of the Discoveries of Modern Geology with Sacred History, 12mo. 3s.—The Anatomical Remembrancer, and Pocket Anatomist, 32mo. 3s. 6d.—The Use of Auscultation and Percussion, by Dr. W. H. Wolf, 8vo. 6s.—Sharpe's Vocabulary of Egyptian Hieroglyphics, 4to. 12s. 6d.—W. H. Woolrych's Treatise on Criminal Statutes: 7 William IV. and 1 Vict., 12mo. 6s.—Aubur's Rise and Progress of British Power in India, Vol. II. 8vo. 21s.; royal 8vo. 1l. 11s. 6d.

## TO CORRESPONDENTS.

Brighton, 5th November, 1837.

Sir,—In answer to F. B.'s query, dated 30th October, respecting the word *coarsing*, inserted in No. 1085, p. 706, and third column, of the *Literary Gazette*, I humbly suggest that it is derived from the old English word *coarsen*, corrected; which word, without any derivation, I find in the "Universal Etymological English Dictionary," vol. ii., third edition, by N. Bailey, 1737, printed for Cox, under the Royal Exchange.

AN OLD SUBSCRIBER.

The feat was performed; and not to reply to other inquisitives and sceptics, why "done" to Nimrod's bet—the ninety miles in three successive hours (see last No. p. 705, col. 1), by the same pair of horses, with a light carriage, was done on the Birmingham and Liverpool Railway train, and the animals were not in the least distressed. The lines on Music have fine thoughts, but some polish is wanted.

ERRATUM.—In our last, p. 706, in the quotation from the "Three Primers," for *coarsing* of words, read *coarsing* of words.

\* See the *Literary Gazette* of Saturday last.

## ADVERTISEMENTS,

Connected with Literature and the Arts.

## PIRACY OF MOORE'S "LALLA

ROOKH."—We, the undersigned, hereby acknowledge that we have infringed the Copyright of Messrs. Longman and Co. the Proprietors of Mr. Thomas Moore's Poem of "Lalla Rookh," in printing and publishing the tale of "Paradise and the Peri," in No. 1. of the Weekly Newspaper entitled "The Ladies' Newspaper," without their consent; and in consideration of their not continuing legal proceedings against us for such infringement, we hereby apologise for having so acted, and undertake that no further copies of No. 1. containing such tale shall be said; and that no further Piracy upon the said Work, or any other Copyright of the said Messrs. Longman and Co., shall be committed by us.

(Signed) JAMES CHARLES SMITH.

## THE PUBLISHERS' CIRCULAR.

No. IV. will be ready on Wednesday next. The anxiety expressed generally amongst Literary Persons and the Trade to have the above publication regularly, evinces the usefulness of such a mode of advertising all works connected with Literature and the Fine Arts; and, from its extensive Circulation throughout Great Britain and the Continent, the Editor feels confident that it will become the standard for Literary Information.

The List of Three Thousand for gratuitous distribution being now complete, the work can only be had by the payment of 4s. in advance for a year's Subscription, or 3d. per copy upon the day of publication, at the Office, 37 Skinner Street, or through any Bookseller.

## SALES BY AUCTION.

SOUTHGATE'S ROOMS.

## Valuable Collection of Books,

By Mr. SOUTHGATE,

AT HIS ROOMS, 22 FLEET STREET, ON WEDNESDAY, NOVEMBER 15, AND FIVE FOLLOWING DAYS, (Sunday excepted).

Consisting of a

Circulating Library of Modern Novels and Popular Literature.

## The Law Library

Of a Barrister: among which are, Modern Reports in the various Courts; the Statutes at Large; the most approved Books of Practice, &c.

A Library of Magnificent Books, Many in elegant binding, removed from the Country.

## The Theological Library

Of the late Rev. Hugh Worthington, of Salter's Hall, &c. May be viewed, and Catalogue (price 1s.) had at the Rooms. Valuations of every Description of Property made, for the Payment of the Probate Duty, and other purposes.

## BOOKS IN THE PRESS.

New Books on the Eve of Publication By Mr. MURRAY.

## THE LIFE, JOURNAL, AND CORRESPONDENCE OF WILLIAM WILBERFORCE.

By his SONS.

4 vols. post 8vo.

## The Life and Correspondence of

Admiral Earl Howe.

By Sir John Barrow, Bart.

With a Portrait, &amp;c. 8vo.

## The Manners and Customs of the

Ancient Egyptians.

By J. H. Wilkinson.

Illustrated by 450 Woodcuts, and numerous other Plates.

3 vols. 8vo.

## Inquiries concerning the Intellectual Powers, and the Investigation of Truth.

By John Abercrombie, M.D. Oxon. and Edin.

8th edition, post 8vo.

## Travels in the Panjab, Ladakh, Kashmir, &amp;c.

By Messrs. Moorcroft and Trebeck.

2 vols. 8vo. with Map and Plates.

## Travels in Arabia (Oman), in the Peninsula of Mount Sinai, and along the Shores of the Red Sea.

By Lieut. Wellsted, F.R.S.

With Map and other Illustrations. 2 vols. 8vo.

## Continuation of the Home Tour

Through various Parts of England, Scotland, and Ireland,

including the Channel Islands, and Isle of Man.

By Sir George Heald.

Post 8vo.

John Murray, Albemarle Street.

Oct. 26, 1837.

On Monday will be published, in 1 vol. 8vo. with a Portrait by Vandyke, price 12s. cloth.

## THE LIFE OF WALLENSTEIN, DUKE OF FRIEDLAND.

By Lieut.-Col. MITCHELL.

"We shall be glad to see the reader any part of the pleasure which we have received ourselves from the perusal of this work. The style of the narrative is very unaffected and impressive, and the author possesses a certain nervous military eloquence, which accords very well with his subject."—*Times*, Nov. 10.

James Fraser, 215 Regent Street, London.

In a few days will be published, by Joseph Rickey, Sherbourn Lane, King William Street, City, complete in 1 vol. 8vo., printed with a new and distinct type, price 21s. extra boards.

## H KAINH AIAHKH.—THE NEW TESTAMENT IN GREEK;

chiefly from the text of Mill; with copious English Notes, a Chronological Harmony, and Three Indices. Adapted to the Use of Schools and Universities, and to the Purposes of general Reference.

Its the Rev. WILLIAM TROLOPE, M.A.; Formerly of Pembroke College, Cambridge; and one of the Classical Masters of Christ's Hospital.

Being comprised in a single Volume, this Edition is not only sold at a moderate price, but is thereby rendered particularly convenient in the Class and the Lecture Room. A corrected Text, Notes, Critical, Philological, and Expository, upon a similar plan with those of the Editor's Edition of Homer's Iliad; exhibiting, moreover, the principal Various Readings, and tracing the sense in obscure and difficult connexions. Concise Introductions to the several Books; a Harmony and copious Indices, are the leading features of the Work; which, by reason of its neat, clear, and beautiful type, will be found to embrace every necessary information connected with the study of this portion of the Sacred writings.

In 1 vol. 8vo. on superfine paper, with Engravings on Steel by Warren and Moulson, price 12s.; large Paper Copies, 12s. half bound morocco, gilt edged.

## The Book of the Cartoons. By the Rev.

Richard Catmelle, R.D.

"His figures are governed by a sentiment of the mind. This is Raffaele's chief excellence; and he may justly be denominated the painter of the mind. In this faculty he included all that is difficult, philosophical, and sublime, who shall compete with him in the sovereignty of art?"—*Lancet*, (Rogee's Translation).

\*A few Impressions of the Plates, India Proofs on 4to. Colombar, with Historical Account, price 5s.

## In Royal 18mo., neatly printed, with numerous Engravings on

Steel, consisting of Historical Vignettes and Portraits of the Kings, &c. (to be continued Monthly), price 4s. cloth lettered, Vol. I. of

The History of England, by Hume and Smollett; with Continuation to the Death of William the Fourth, by the Rev. Henry Stebbing, M.A.; Author of "The Christian Church," and "The Reformation." Hume, 10 Vols.—Smollett, 6 Vols.—Stebbing, 4 Vols.

\*Vol. I. contains a Discourse on the Study of History, by the Rev. H. Stebbing; a History of David Hume, written by himself; and that portion of the History from the Invasion of the Romans to the Reign of Henry the Second. With Eight Steel Engravings. Price only 4s.

\*Vol. II. will be published on the 1st of December, with Seven Engravings.

## In fcap 8vo., neatly printed, 4s. 6d. cloth extra, a new and

revised Edition of

## Bunyan's Pilgrim's Progress: with an Original

Narrative; a Key to the Spiritual Parts of the Dream; and all Passages of Scripture, heretofore merely referred to, printed at length as Foot-Notes; rendering the Work particularly useful for Family reading.

\*Amongst the many editions which have been printed of this highly interesting and extraordinary book, the present is presumed, will be esteemed the most acceptable. Here will be found both chapter and verse—showing the source from whence the author's inspiration sprang, and the power of his genius in the application of his material. Great care also has been taken in marking the disguise, need repetition of names being avoided, and the whole rendered worthy of its great and admired writer.

\*Ask for Kicker's Edition.

## In post 18mo. price 3s. 6d. cloth elegant, gilt edges, a Ruby

edition of

## Dr. Watts's Hymn Lyrics. Poems, Sacred

to Devotion and Piety—to Virtue, Honour, and Friendship—and to the Memory of the Dead. With Memoir of the Author, by Robert Southey, Esq. Post Laureate.

"The public estimate of Dr. Watts, in his character of a poet, rests chiefly on his Hymns. The reader needs only, however, to peruse these Lyrics, to perceive that he has claims to a higher place among English Poets, than would be justly due to him merely as the author of those Hymns, but often feeble compositions. In a period like ours, there would appear to be no sufficient reason why the superior intellectual value of the present collection should prevent its rivaling the Hymns in extent of popularity—a circumstance to be desired by all who seek the advancement of virtuous poetry."—*Review*.

An edition in larger type, price 4s. 6d.

London: Published by Joseph Kickerby, Sherbourn Lane, King William Street, City.

Agents for Scotland, Oliver and Boyd; Ireland, John Cumming.

On the 15th November will be published, 8vo., with Maps and Plates, price 5s.

#### REVIEW OF NEW BOOKS.

*Issues of the Exchequer; being a Collection of Payments made out of his Majesty's Revenue, from King Henry III. to King Henry VI. inclusive, &c.* By Frederick Devon. 8vo. pp. 664. London, 1837. Murray.

TIED of exposing the folly and ignorance exhibited in all proceedings relative to our Public Records, we did not notice this volume when it appeared; we did not even look at it. But "better late than never." In a recent examination of its contents, we became sensible of the absolute necessity of endeavouring to prevent a waste of more government money upon the "Issues of the Exchequer," under the superintendence of Mr. Devon, whose editorial qualifications we examined in a review of the volume which preceded the present: for this reason we are compelled to take up the subject even now, at the eleventh hour. Prepared to admit that there is a *little* interesting matter to be gleaned from the Pell Records; we are also prepared to shew that Mr. Devon is not the man to discover that *little*, much less to turn it to good account. "A mere antiquary," says Johnson, "is a rugged being: what must an uninformed one be?" Our readers will be enabled to judge, after perusing this article.

It is greatly to be lamented, that, when the Treasury resolved to print a series of extracts from these Records, the superintendence of the work was not committed to a person capable of forming such a correct view of the nature and value of the various entries as would have spared the reader a perpetual repetition of information already given *usque ad nauseam* in the publications of the Record Commission; and, consequently, have insured the appearance of new and interesting matter. Of what use was it to print hundreds of documents, proving that the superstitious weakness of Henry III. fitted him for the cloister rather than the throne; that of the three Edwards, the First paid regular salaries to his judges, enforced their authority, had ancient Rolls transcribed and more ancient books rebound; that the Second was perpetually embroiled with his subjects; and that the third loved the pomp and parade of tournament, joust, and feast—the splendid vanities of chivalry and war? All this was transmitted to us by contemporary writers, and a few confirmations of their evidence would have sufficed. We know, from the same authorities, that folks in ancient times wore hose, and shirts, and gloves, and shoes; that they slept in beds, and lived in houses, cots, or castles, and warmed them with fires, first of wood and then of coal; that kings, and barons, and knights, ate fish, flesh, and fowl, drank Cyprus and Malvoisie, Malmsey and Methglin; and that yeomen and "squires of low degree" washed down their frustums of meat with tankards of ale. A few entries, shewing the prices of apparel and victuals, the positive necessities or mere luxuries of existence, and the value of labour in successive reigns, would have enabled us to form as good an estimate of the commonplace of life in the days of the Plantagenets and Tudors, as we can now arrive at by wading through se-

veral huge volumes of undigested materials. The progressive improvement of the people, government, and law, obscure or doubtful points of political history; the lives of individuals rendered eminent by their virtues or crimes (for the curiosity of a remote posterity is always indiscriminate), were the chief points which demanded illustration, and which should have been invariably kept in view.

But if Mr. Devon was not able to form a plan, neither were the commissioners on the Public Records before him: a sudden leap was made into the vortex of copying and printing; large books were published, to which editors wrote long prefaces, complimenting each other upon discoveries which their readers always found to be mares' nests, and praising the exertions of the commissioners, the kindness of their patrons—exertions which consisted in never leaving their warm libraries and easy chairs to encounter the cold of Record Offices and the dust and vermin of musty parchments, and kindness which permitted a system of jobbing to waste the public money and injure the public service. Yet, in the intoxication of self-conceit, all fancied they were furnishing torches to illuminate the darkness of the Middle Ages. What has been done? In his "Essay on *Nothing*," Fielding most truly observed, "the study of this important subject fills up the whole life of an antiquary, it being always at the bottom of his inquiry, and is commonly, at last, discovered by him with infinite labour and pains."

The volume before us is, if possible, worse than its predecessor. It contains an introduction in 139 pages, which the reader will be puzzled in many instances to understand, for the obvious reason, that the editor has seldom understood himself or his subject. The plan of it is curious; in the first place, we are favoured with very incorrect sketches of those events in each reign upon which the extracts are supposed to bear, and these sketches are followed by wretched abridgements of the extracts themselves, illustrated by notes of the most puerile description, and derived from the worst authorities. Mr. Devon has perpetually committed the mistake common to all persons who, taking up a subject of which they were previously ignorant, imagine that every thing that is a novelty to themselves, must be a discovery worth detailing to their readers. The abridgements are without dates, and, therefore, useless. In order to confirm our assertions, we shall select a few examples of Mr. Devon's commentary, and the authorities to which he refers.

He informs us, that the first entry on the roll of the 10th of Henry III., "furnishes evidence of the existence of a fair at St. Ives, at this early period;" and adds in a note, "the prescriptive right to take tolls at this fair is now in course of litigation." To the editor this may be a curious fact, but had he consulted Madox, whom he often quotes at second-hand, he would have discovered something still more curious; viz. that the Abbot of Ramsey obtained a charter of this fair in the 4th of John, twenty-seven years before, and frequent mention of it occurs on the rolls of that reign: we men-

tion this more out of pity to the litigants than to enlighten Mr. Devon. "Upon the same roll," he continued, "the king is found rewarding the abbot and monks of Warden for their losses and services rendered near the town and castle of Bedford; which, probably, relates to the disturbance a few years previous, caused by Foulques de Breaute, who seized and imprisoned the judge in this castle." What losses these venerable churchmen rendered at the siege we leave Mr. Devon to explain; services they rendered none, as will appear on referring to the instrument which he quotes: this, however, is one only of innumerable instances of the editor's skill in writing his mother tongue. We agree with him that it probably refers to the insurrection of Fulk de Breaute,—it certainly does—but what may the reader understand by "a few years previous?" Five, six, or, perhaps, a dozen years would not be a very liberal interpretation. Unfortunately for Mr. Devon's expression, the siege of Bedford took place scarcely two years before the date of the entry in question, and this proves that he could not have referred to Matthew Paris, whom he quotes in his note. The printed close roll of the 8th of Henry III. would have set him right.

Mr. Devon next observes, that the accession of Hubert de Burgh to the government of Henry III., on the death of the Earl of Pembroke, "together with other incidents in history, frequently referred to in the Pell Records, being matters of sufficient historical notoriety, are not noticed." What the "other incidents in history" may mean we cannot guess; but it is quite clear, that however well known the history of Hubert de Burgh and the reign of Henry III. may be to the commonly well informed, Mr. Devon is grossly ignorant of it, or he would not have poured forth his interesting sympathy with Hubert in a note containing some trumpery tales as to the cause of the justiciary's ruin, extracted from "Lyon's History of Dover," a work of about the same value in political history as the "Adventures of Jack the Giant Killer." Supposing it to have been necessary to give a note to the record of Hubert de Burgh's salary as governor of Dover Castle—an entry which was certainly not worth printing—Mr. Devon would have found the real charges against him in Matthew Paris; a book which, although he has quoted more than once, we are now quite sure he never read. Our editor's partiality for queer authorities is most amusing: he appears to have consulted his own library only, and to have purchased cheap books for it. He tells us, that Andrews styles de Burgh the gallant defender of Dover Castle:—of Andrews the historian we never heard: but, doubtless, Mr. Devon's quotation will bring him into note. In the last volume he published, his fondness for "Baker's Chronicle" induced him to oppose it to the testimony of state papers, and he has drawn largely upon it in the present one. "Baker's Chronicle" always lay in the hall window of Sir Roger de Coverley, probably it always lies on the reading desk of Mr. Devon, and is to him, as it was to the worthy baronet, a decisive authority on all matters of history. There is something

extremely interesting in this; we can readily imagine it to have been the favourite book of his childhood, and that he regards it as the work which first excited his juvenile ambition, and prompted him to embrace the studies which promise to procure him such an enviable and lasting reputation. We have no objection to a man's preserving through life the rattle which excited his infantine ecstasies, but it is decidedly disagreeable when he takes every opportunity of shaking it in our hearing. To proceed:

Mr. Devon has discovered, from a roll of accounts rendered by the Jews, that the contributions extorted from that unfortunate race were chiefly paid by Jewesses. This is not true. Heiresses and widows were, of course, obliged to pay large sums, and in a particular year they may have paid more than the men; but to admit Mr. Devon's theory, would be to conclude that all the wealth of this people was in the hands of the women, which is opposed to reason and facts. He informs us, in a note upon this statement, that several of the Jews' rolls and stars have lately been discovered among the records of the Exchequer, by the clerks of a Mr. Cooper, who, as our readers may remember, was secretary to the defunct record commission. It is insinuated, also, that these documents are to be printed at public expense: if such be the intention, we cannot remonstrate too strongly against it; they are mere rubbish, and, if sorted and arranged, antiquaries, who are curious about the ancient Jews, will, doubtless, consult them in MS.

Before we quit the reign of Henry III., we may remark, that the roll of the expenses of repairing and rebuilding part of the palace of Westminster, in the 43d of this reign, did not deserve to be printed at length, since almost every item in it occurs also on the close and liberate rolls, which are in course of publication: for instance, the payment to William the Painter, for designing the picture of Jesse, on the mantel-piece of the chimney, which excited some frigid ecstasies in a few of our contemporaries, was printed by Walpole, in an extract from a close roll, half a century ago. Jesse, the Wheel of Fortune, and the Dream of St. Edward, were favourite subjects with Henry; and so confined was his taste in subjects for the pencil, that the united diligence of all the antiquaries in the kingdom could not make one important addition to the notices to be found in the first volume of the "Anecdotes of Paintings."

The extracts from the rolls of Edward I. and II. are of very little importance: in commenting upon them, Mr. Devon takes occasion to call the "Excerpta Historica" "a most delightful work, and ably edited." That it is a curious work, and carefully printed, every one who knows any thing of it will be ready to allow, and, at the same time, to lament that it was discontinued; but to call it "delightful," is a piece of affectation on the part of Mr. Devon, who has shewn, in several instances, that he did not understand those parts of it which he quotes. In the 34th of Edward I., a roll, concerning the affairs of Scotland, was deposited in the Treasury. The editor thus translates the record of its delivery.

Memorandum.—That on this present Tuesday, next after the Octaves of the Holy Trinity; to wit, on the 7th day of June, Andrew, formerly William de Tang, clerk sacrist in the diocese of York, a public notary, by authority of the apostolic see, delivered into the Treasury," &c.

This is clearly nonsense: how could Andrew

have been formerly William de Tang? The sense may be restored by reading "Andrew, formerly, or late, clerk to William de Tang, sacristan, notary public of the diocese of York." Mr. Devon must acknowledge the correctness of our emendation.

In his remarks upon the reign of Edward III. the editor calls the engagement at Neville's Cross, the battle of Durham, and quotes Bayley's "History of the Tower," to prove that the victory of the English destined David Bruce to confinement in that citadel. We were not aware that this fact was at all doubtful until settled by Mr. Bayley. This absurdity is surpassed by the following passage:—"We have a payment to Walter Norman and his seventeen companions, for remaining in the king's barge, as well by day as by night, upon the Thames, near the Savoye, for the safe custody of John, king of France. This precaution was, doubtless, necessary, though I believe that an intention to escape has never been charged against the illustrious captive by any historian, (i. e. Baker's Chronicle); the king probably was less anxious to retain the French sovereign in his possession, than to guard against the loss of his ransom." Perhaps Mr. Devon will inform us in what other way Edward could "guard against the loss" of the French king's ransom, than by retaining him in his possession until it was paid. These puerilities meet us at every step.

When Godwin emptied half the "Encyclopædia Britannica," and almost all the "Archæologia," into two huge quarto volumes, and quizzed the learned at the commencement of the 19th century, by calling his composition the "Life of Chaucer," he flattered himself he had raked together all the important documents relating to the life of the poet. One, at least, escaped him, and that one is the most curious entry in Mr. Devon's publication. It shews that Chaucer was sent on a mission into Lombardy in the first year of Richard II. (1377), four years after the date of his embassy to Genoa, during which he is supposed, as we believe, without the slightest foundation, to have visited Petrarch. This is a curious fact in the life of so eminent a man, but scarcely worth obtaining at the expense of printing a huge volume of trash. Mr. Devon has passed by this entry without indicating its value. We will not decide whether Thomas Chaucers, mentioned here as chief butler to Henry IV., was the son of the poet, and, consequently, the same Thomas who was speaker of the House of Commons.

At page 55 of the Introduction, we are told that Richard II. purchased "a Bible written in the Gallic language." Mr. Devon might as well have said French, but it is really laughable to find him translating it by "Gaelic" in the extract itself, p. 213. These are slight inconsistencies. Some payments for gunpowder and cannon in the first of Richard II. elicit from the editor the following remarks:—"The making of gunpowder, or rather its use and application in England to warlike purposes, has generally been assigned to a later date than that here noticed:" and in a note he continues—"Though gunpowder is stated to have been invented by Schwartz, a German monk, at Cologne, in 1330, and great guns to have been used by Edward III., at the battle of Cressy, in 1346; yet Aspin, Salmon, Tegg, and other chronologists, state 1418 as the earliest use of them in England, which is above thirty years subsequent to the date of the Issue Roll, 1 Richard II."

It is true the invention of gunpowder is

popularly ascribed to Barthold Schwartz; but it was in 1320, not in 1330, that he is said to have made the discovery. It is now certain that it was known in the East, and used in the construction of rockets and shells, a century before his time;\* and Roger Bacon, in 1270, had described its nature and use in the composition of squibs and crackers, the playthings of children in his day. We learn from Barbour,† that Edward III. was provided with artillery in his expedition against the Scots in 1327; and from Froissart, that cannon and "bombards" were used in the defence of Quesnoy, in Hainault, in 1342, four years before the battle of Cressy. The Rolls of Parliament shew that it was obtained for the defence of the Castle of Jersey, in 1339.‡ It may, therefore, be reasonably concluded, that cannon were used in this country half a century, at least, before the reign of Richard II., notwithstanding the opinions of Mr. Devon's authorities, Messrs. "Aspin, Salmon, and Tegg;" the latter of these gentlemen we believe to be the respectable bookseller in the Poultry, who is thus exalted to the dignity of a chronologer, because he happened to publish a little work compiled by somebody else, and which has a place, we suppose, among the cheap books in Mr. Devon's library.

Following the editor to the reign of Henry IV., we find that he imagines the battle of Homildown to have happened after the battle of Shrewsbury, thus making Hotspur fight a battle after his decease; and having committed this notable blunder, he proceeds to shew that Shakespeare was wrong in making Sir Walter Blount the messenger who brought the news of this victory to Henry, when, in reality, Nicholas Merbury was the fortunate person, and sums up his learned note by observing, with comic gravity, that "many errors as to time, circumstance, and place, and attributing actions to wrong persons by Shakespeare, might be corrected by the Issue Rolls." How unfortunate that the poet did not consult these rolls when writing his plays! pity the poor fellow could not foresee that, in the nineteenth century, a Devon was to arise and tell the world that Shakespeare knew nothing of his story! and then, ye commentators, Theobald, Warburton, Malone, Johnson, Stevens, why did you not tack extracts from these records to your notes? To be serious, it is clear poor Mr. Devon has hitherto supposed Shakespeare's historical plays to be accurate verified chronicles, and now crows over the discovery of his mistake, accomplished by the aid of the Pell Records, without a suspicion that he, and not immortal Will, is a ninny.

Upon the roll of the 29th, Henry VI., are seen entries relative to the reception, in England, of William, eighth earl of Douglas, on

\* We purposely leave out particular mention of its more early use among the Chinese.

† The poet, speaking of the Scots, says,

"Twa noweltis that day that saw,  
That foruth in Scotland had bene nane:  
Tymmeris for helms war the tane,  
That thaim thought thane off gret bewte,  
And alua wondyr for to se.  
The totyr, crakys war of teer,  
That thal befor herd neur er,  
Off thir twa thingis that had ferly."

The Bruce, v. 173. Edin. 1820.  
Tymmeris were crests for helmets. Dr. Jamieson observes, "this is the simple account that the good archdeacon gives of artillery; and, certainly, at their introduction, it was extremely natural thus to design them from the noise they made." Crakys were certainly guns: the word is used by English writers of a later date.

‡ There are two entries on these Rolls, which are supposed to relate to gunpowder, v. ii. pp. 1066, 115. The word used is "pomadre," which some antiquaries have decided to mean cider. In the first one, from its being joined with iron and steel, we are tempted to follow the translation of Cotton.

his return from Rome, upon which Mr. Devon has the following note, *Introd.* p. 132.

"This Earl Douglas was a most sanguinary monster. On his arrival from Rome, he passed through England with a safe conduct. James, king of Scotland, received him with cautious kindness, invited him to his palace, and stabbed him with his dagger. Sir Patrick Gray (whose nephew he had most barbarously murdered) clove his skull with a battle-axe, and armed men rushed in and covered him with wounds."

Commend us to the *cautious kindness* of the man who invites another to his house, and stabs him: where did the editor learn that such a proceeding is in any way allied to kindness? He is wrong, moreover, in supposing that this peculiar sort of hospitality was shewn to the earl immediately upon his arrival in Scotland. Two years elapsed between his return and murder. As to his having been "a most sanguinary monster," we know of no deeds that entitle him to such an epithet. His execution of Herries of Terregles was in every way justifiable; the laird was taken with the "red hand," in the commission of a gross outrage within the earl's jurisdiction as Lieutenant of the Marches, and suffered accordingly. The banishment of the tutor of Bombie, Gray's nephew, was not without colour of law; the man had murdered Douglas's servant. But, what epithet is too bad for James and Crichton, and their accomplices, nobles of the land, who invited Douglas to Stirling, under a safe conduct, guaranteed by the most solemn oaths, with the intention of assassinating him? Of this part of the story, Mr. Devon, of course, knew nothing; he saw somewhere that the earl was a bloody fellow; the name pleased him, and he copied it, without caring to inquire further. Indeed, from the ferocity with which he describes the murder, we suspect that Mr. Devon himself is rather sanguinary in his imagination: we see him with his editorial battle-axe ready to treat Shakespeare with "cautious kindness," for having omitted to versify the Pell Records.

Having now given the reader some idea of Mr. Devon's Introduction—and, be it noted, that we have not called a tithe of the blunders in it—we shall conclude with a specimen of his powers of translation, selected at random from among many of the same description; in fact, every instrument in the book is more or less at variance with the sense of the Latin original.

"15th October. Paid to William de Aston, clerk to the Bishop of Coventry and Lichfield, so much as the same William had paid for the king at the court of Rome, to divers cardinals in the said court, for fees which the king owed, and for the king's other necessary payments; to wit, to Master Gillinus de Pergamo, of St. Nicholas, in prison; to Tully, dean to the cardinal, for his fee for the whole thirty-first year of King Edward, fifty marks; to brother Gentilus, by the title of St. Martin in the Mountains, priest to the cardinal, twenty-five marks; to Master Luke de Flysco, of Saint Mary in Via Lata, dean to the cardinal, for the said whole year, fifty marks." P. 115.

Passing over the first part of this extract, which is sufficiently confused, it must be obvious to any one who examines it with attention, that the first person mentioned as paid, Master Gillinus, is not a cardinal, but a man, who, according to Mr. Devon's punctuation, was in prison, and that the sum paid to him is not specified; there must be some error, therefore, in the description of him, and, as regards the payment, an omission, either on the part of the ancient scribe or the modern editor. The

next person is Mr. Tully: we do not believe that a Roman ecclesiastic ever bore the name of the Roman orator; and it is certain that, although there are deans to cathedral and collegiate churches, there are no such functionaries in relation to their eminences, the cardinals. The reader may be puzzled to discover whether Brother Gentilus was nicknamed St. Martin in the Mountains, or whether he acted only as deputy to that respectable saint; nor is the obscurity of the entry cleared away by calling him priest to the cardinal. After Brother Gentilus, we have Master Luke of St. Mary, another dean to the cardinal, which appellation must be another mistake. Thus, although this entry was intended to be a record of payments made to "divers cardinals,"—and from the "to wit" we might reasonably conclude the Scribe intended to put down their names—it seems from Mr. Devon's translation, that the money was all paid to deputies of one person, who must have been well known, since he is mentioned only as "the Cardinal." How can you explain this, learned editor? We answer for him: the original record must have run as follows:—Paid, "Magistro Gillino de Pergamo, T.T. Sancti Nicholai, in Carcere Tulliano, diacono cardinali;" i. e. to Master Gillinus de Gergamo, Titular of St. Nicholas, in Carcere Tulliano, cardinal deacon. "Fratrī Gentilo, T.T. Sancti Martini, in Monte, presbitero cardinali;" to Brother Gentilus, Titular of St. Martin, in Monte [Cavallo], cardinal priest. "Magistro Luce de Flysco, T.T. Sanctæ Mariæ, in Via Lata, diacono cardinali;" to Master Luke de Flysco, Titular of Saint Mary, in Via Lata, cardinal deacon.

By this new reading, we find the "divers cardinals" enjoying their proper titles, and we perceive, also, that Mr. Devon has ingeniously split three lofty ecclesiastics into four very strange characters; viz. a man in prison, two deans,—such deans as never were—and a priest. By what clever process the editor achieved this partition of persons, some may be at a loss to conceive. Perhaps he was asleep when he translated the passage; but such a supposition implies that he must have been in a state of somnolency when he transcribed it: how, otherwise, is the strange punctuation to be accounted for? The more rational inference, we are sorry to say it, is, that Mr. Devon's ignorance occasioned this ludicrous blunder. He clearly knew nothing of the cardinals and their titles, which is surprising in one who, from his situation in a record office, must have often met with documents in which the various styles of the papal legates and envoys in this country in former times are set forth. That he is all but ignorant of the Latin language is still more apparent; for, although we shall not quarrel with him because he never read of the celebrated "Carcer Tullianum," of which Sallust's striking description is familiar to the merest booby who ever had the good fortune to be birched through the Latin course of a cockney academy,—no one to whom the rudiments of the language were known would have rendered "Tullianum" by "Tully"—what shall we say of his mistaking Diaconus, a Deacon, for Decanus, a Dean; and translating "Monte" by "in the mountains?" A man may be a dull and respectable interpreter of records, although he never heard of Servius Tullius, the prison that he built, in which the accomplices of Cataline certainly were, and St. Peter and St. Paul are said to have been, confined. Ay, even though he believe that St. Paul's was built by the Apostle, and that Gog and Magog lived and died in

Guildhall; but that an editor employed by her majesty's government to publish for the benefit of the country, should have supposed that Diaconus signified a Dean,—to say nothing of his admirable confusion of dative and genitive cases—might be treated as incredible, were it not proved by the testimony of his own work. Verily, this is the age of humbug!

There is, however, one point in Mr. Devon, indicative either of amiable simplicity or excessive indolence—his apparent ignorance of the noble art of book-making. If indolence be the dominant power in his composition, we suppose we are indebted to that misfortune for an escape from the miseries which some of his brother record editors, more industrious and worldly-wise as to the payment per sheet, would have inflicted upon us, by taking the passage above quoted as a peg whereon to hang a history of the sacred college—perhaps the biographies of all its members, from the seventh century to the present time—a list of the cardinal churches in Rome; and certainly an essay, replete with wonderful discoveries, or crude conjectures upon deacons, rural deans, and parish priests; ending in a digression upon first-fruits, tithes, great and small, malt and hops, Cheshire cheese, and sucking pigs. The whole plentifully seasoned with reflections upon the growth of the constitution, and the artful policy of the court of Rome. Happily, one or the other of the causes we have mentioned has spared us such an infliction from Mr. Devon; we take the liberty, however, to hint to him, that, with a little more exertion, he promises to shine—that Littleton and Ainsworth, together with Ruddiman's Rudiments, or the Eton Grammar, are cheap books; and that Spelman and Ducange are to be found, when he shall be able to read them, in the literary workshop of London, the British Museum; but, let him use them for his own improvement, for he may be assured that the generality of readers are not so ignorant as he takes them to be.

It only remains for us to ask, Will the Treasury permit any more of this nonsense to appear?

*Southey's Works.* Vol. II. London, 1837. Longman and Co.

THE second volume contains "The Triumph of Woman," written in 1795, and dedicated to Mary Wollstonecraft. This is now curious in more respects than one; but our readers will, perhaps, be more interested with the reappearance of "Wat Tyler," a drama of the same period, with a preface by its author. We copy it.

"Twenty years ago," says the Poet Laureate, "upon the surreptitious publication of this notable drama, and the use which was made of it, I said, what it then became me to say, in a letter to one of those gentlemen who thought proper to revile me, not for having entertained democratical opinions, but for having outgrown them, and learnt to appreciate and to defend the institutions of my country. Had I written lewdly in my youth, like Beza, like Beza I would ask pardon of God and man; and no considerations should induce me to reprint what I could never think of without sorrow and shame. Had I, at any time, like St. Augustine, taught doctrines which I afterwards perceived to be erroneous—and if, as in his case, my position in society, and the estimation in which I was held, gave weight to what I had advanced, and made those errors dangerous to others,—like St. Augustine, I would publish my retractions,

and endeavour to counteract the evil which, though erringly, with no evil intention, I had caused. Wherefore, then, it may be asked, have I included Wat Tyler in this authentic collection of my poetical works? For these reasons,—that it may not be supposed I think it any reproach to have written it, or that I am more ashamed of having been a republican, than of having been a boy. ‘Quicunque ista lecturi sunt, non me imitentur errantem, sed in melius proficientem. Inveniet enim fortasse, quomodo scribendo profecerim, quisquis opuscula mea, ordine quo scripta sunt, legerit.’ I have endeavoured to correct in my other juvenile pieces such faults as were corrigible. But Wat Tyler appears just as it was written, in the course of three mornings, in 1794; the stolen copy, which was committed to the press twenty-three years afterwards, not having undergone the slightest correction of any kind.”

This is worthy of Southey; nor is Wat Tyler unworthy of his earlier years. Well were it for mankind that political errors were confined to the warm and ebullient feelings of youth. It is acquired wisdom and enlarged views which enable us to weigh certain conditions and restraints against the love of perfect liberty. What schoolboy would not be a republican\* (equality) if, perhaps, he could not be a master! No fellow of seven years old ever admired fagging,—the universal *beau idéal* is to fag others. Southey’s adversaries must have been hard put to it, when they brought forward Wat Tyler, of 1794, as a proof of bad principle or tergiversation. It contains many just and noble sentiments.

Poems concerning the slave trade follow, and do yet more credit to pure youthful emotions: Botany Bay eclogues, sonnets, monodramas, amatory poems, lyrics, and other miscellanies of various dates, fill up this volume. All of them exhibit the workings of true genius; nor does one of them reflect a stain upon the heart of the writer. On the contrary, the prevailing features do him the highest honour.

We will, however, only quote one or two examples of different character and on other grounds. The elegy is (probably) a forgotten sample of the sportive amatory.

“The Poet expatiates on the Beauty of Delia’s Hair.”

The comb between whose ivory teeth she strains  
The straitening curls of gold so beamy bright,  
Not spotless merely from the touch remains,  
But issues forth more pure, more milky white.

The rose-pomatum that the *frieseur* spreads  
Sometimes with honour’d fingers for my fair,  
No added perfume on her tresses sheds,  
But borrows sweetness from her sweeter hair.

Happy the *frieseur* who, in Delia’s hair,  
With licensed fingers uncontrol’d may rove!  
And happy in his death the dancing bear,  
Who died to make pomatum for my love.

Oh! could I hope that e’er my favoured lays  
Might curl those lovely locks with conscious pride,  
Nor Hammond, nor the Mantuan Shepherd’s praise,  
I’d envy then, nor wish reward beside.

\* Look at the commonest effect of classical education. Well does Southey, in a poem of 1798, make the Muse of History thus address him, when he courts retirement and the *dolce far niente*.

“Oh, shame! shame!

Was it for this I waken’d thy young mind?  
Was it for this I made thy swelling heart  
Throb at the deeds of Greece, and thy boy’s eye  
So kindle when that glorious Spartan died?  
Boy! boy! deceive me not! . . . What if the tale  
Of murder’d millions strike a chilling pang;  
What if Tiberius in his island stews,  
And Philip at his beads, alike inspire  
Strong anger and contempt; hast thou not risen  
With nobler feelings,—with a deeper love  
For freedom? . . . If righteously thy soul  
Loathes the black history of human crimes  
And human misery, let that spirit fill  
Thy song, and it shall teach thee, boy! to raise  
Strains such as Cato might have deign’d to hear,  
As Sidney in his hall of bliss may love.”

Cupid has strung from you, O tresses fine,  
The bow that in my breast impell’d his dart;  
From you, sweet locks! he wove the subtle line  
Wherewith the urchin angled for my heart.

Fine are my Delia’s tresses as the threads  
That from the silk-worm, self-interr’d, proceed;  
Fine as the gleamy gossamer that spreads  
Its filmy web-work o’er the tangled mead.

Yet with these tresses, Cupid’s power elate,  
My captive heart has handcu’d in a chain,  
Strong as the cables of some huge first-rate,  
That bears Britannia’s thunders o’er the main.

The sylphs that around her radiant locks repair,  
In flowing lustre bathe their brightening wings;  
And elfin minstrels, with assiduous care,  
The ringlets rob for fairy fiddle-strings.”

Of Dactyls and Sapphics the following will revive curious memories, both for themselves and their famous parodies in the *Anti-Jacobin* :—

“The Soldier’s Wife.”

Weary way-wanderer, languid and sick at heart,  
Travelling painfully o’er the rugged road,  
Wild-visaged Wanderer! God help thee wretched one!  
Sorely thy little one drags by thee bare-footed,  
Cold is the baby that hangs at thy bending back,  
Meagre and livid, and screaming for misery.

• Woe-begone mother, half anger, half agony,  
As over thy shoulder thou lookest to hush the babe,  
Bleakly the blinding snow beats in thy haggard face.  
Ne’er will thy husband return from the war again,  
Cold is thy heart and as frozen as Charity!  
Cold are thy children.—Now God be thy comforter!”

“The Widow.”

Cold was the night wind, drifting fast the snow fell,  
Wide were the downs and shelterless and naked,  
When a poor Wanderer struggled on her journey,  
Weary and way-sore.

Drear were the downs, more dreary her reflections;  
Cold was the night-wind, colder was her bosom:  
She had no home, the world was all before her,  
She had no shelter.

Fast o’er the heath a chariot rattled by her,  
‘Pity me!’ feebly cried the lonely wanderer;  
‘Pity me, strangers! lest with cold and hunger  
Here I should perish.

‘Once I had friends,—though now by all forsaken!  
Once I had parents,—they are now in heaven!  
I had a home once—I had once a husband—  
Pity me, strangers!

‘I had a home once—I had once a husband—  
I am a widow, poor and broken-hearted!’  
Loud blew the wind, unheard was her complaining,  
On drove the chariot.

Then on the snow she laid her down to rest her;  
She heard a horseman,—‘Pity me!’ she groaned out;  
Loud was the wind, unheard was her complaining,  
On went the horseman.

Worn out with anguish, toil, and cold, and hunger,  
Down sunk the Wanderer, sleep had seized her senses;  
There did the traveller find her in the morning;  
God had released her.”

Though it may seem strange for an Appendix, we subjoin a part of the Preface to the volume, as a matter of literary interest.

“The earliest pieces in these juvenile and minor poems were written before the writer had left school; between the date of these and of the latest there is an interval of six and forty years: as much difference, therefore, may be perceived in them, as in the different stages of life from boyhood to old age. Some of the earliest appeared in a little volume published at Bath in the autumn of 1794, with this title:—‘Poems, containing the Retrospect, &c. by Robert Lovell and Robert Southey, 1795; and with this motto—

Minuentur atræ  
Carmine cune.—Horace.

At the end of that volume, Joan of Arc was announced as to be published by subscription. Others were published at Bristol, 1797, in a single volume, with this motto from Akenside:—

‘Goddess of the Lyre,—

with thee comes  
Majestic Truth; and where Truth deigns to come  
Her sister Liberty will not be far.’

A second volume followed at Bristol in 1799, after the second edition of Joan of Arc, and commencing with the ‘Vision of the Maid

• This stanza was written by S. T. Coleridge.

of Orleans.’ The motto to this was from the epilogue to Spenser’s *Shepherds’ Calendar*:—  
‘The better, please; the worse, displease: I ask no more.’”

*The Life of Wallenstein, Duke of Friedland.*  
By Lieut.-Colonel J. Mitchell, H.P. 8vo.  
pp. 368. London, 1837. Fraser.

NOT only general history, but the drama and the episode collection-books, have made us so well acquainted with Wallenstein and his times, that we shall merely notice this separate biography as a well-chosen contribution to war, politics, and literature; and afford our readers a complete idea of its tone and manner by one interesting extract—the finale of a strange and glorious scene:—

“And how was Wallenstein occupied while the dark web of treason was weaving around him? Embodying rebel armies, strengthening himself by foreign alliances, building strongholds, or corrupting the soldiers placed under his command? The reverse was the case: he was zealously engaged in quartering the troops for the winter, and in carrying on, with the full knowledge of the emperor, the Saxon negotiation. He was, to the last, in friendly correspondence with Piccolomini and with Ferdinand himself; and, on the 13th of February, the very day on which Gallasso issues his secret ‘bollettino’ from Pilsen, the emperor writes to Wallenstein, whom he had outlawed twenty days before, ‘confiding the kingdom of Bohemia to his approved care and protection, should the Swedes,’ who had assembled in force near Ratisbon, ‘advance against the frontier.’ To what extent Wallenstein was apprised of the measures taken against him, is not very certain; but he no sooner heard that an unfavourable construction had been put upon the meeting at Pilsen, than he again called the officers together, and signed, along with them, a joint declaration, expressive of their ‘entire devotion to the emperor, and of their resolution to shed every drop of their blood in his service.’ This was on the 20th of February. But, as every hour now brought proof that hostile proceedings were already in progress, he dispatched Colonel Mohrwald to Vienna on the 21st, and General Brenner on the 22d, to assure the emperor of his perfect readiness to resign the command, and to appear at any time and place, to answer whatever charges might be preferred against him. Both messengers were arrested on the road, the one by Piccolomini, the other by Diodati; the latter declaring, in his official report of the circumstance, that the message to the emperor was only a trick devised by Wallenstein to save ‘i suoi ducati.’ It was not till after the emperor’s proclamation, which denounced him as an outlaw, had been publicly posted up at Prague, that Wallenstein learned, or believed, the full extent of his danger. Hearing, at the same time, that some of the troops had already refused to obey his orders, and that Piccolomini and Diodati were marching towards Pilsen, where no preparations had been made for resistance; he determined to fly to Eger, and to throw himself into the arms of the allies. Before his departure he sent Prince Francis Albert to the Duke of Weimar, then at Ratisbon, to solicit assistance. As the fugitive general had nothing left, which he could carry over to the allies, but his name and fame, the aid requested implied little more than protection for his outlawed life. And even this was at first denied; sufficient proof that no understanding existed between him and the allied commanders. ‘If Wallenstein still lives,’ says Oxtenshiern, in a letter to the Duke of Weimar,

'throw no obstacles in the way of his plans: if he is dead, there will be confusion in the imperial army, of which it might be well to take advantage.' When Francis Albert arrived at Ratibon, the Duke of Weimar positively declined to move on the mere word of the Duke of Friedland. 'Who believes not in God,' said Bernhard, 'will not be believed by man;' and it was only after the news of Wallenstein's actual departure from Pilsen had been received, that he set out at the head of his army for Eger. But the blow had been already struck, and the Swedes 'came but to augment the slaughter.' Wallenstein left Pilsen on the morning of the 22d of February, 1634, accompanied by Counts Illo, Terzky, Kinsky, Colonel Butler, and Rittmeister Neumann. As he suffered greatly from gout, he travelled in a sedan chair carried between two horses: and the man who was to have marched rebellious armies to the gates of Vienna was only escorted by seven companies of infantry, and 200 dragoons. The horsemen were under the orders of Colonel Butler, an Irish Catholic officer, to whose regiment they belonged; and who sent his chaplain\* to tell Piccolomini that he, Butler, would remain faithful to his allegiance, and use every effort to thwart the designs of the rebels. Galass, and the Marquis de Grana, had, as they inform the emperor, received similar assurances; and the Marquis says of Butler, that 'he is a cavalier on whom his majesty may place the most perfect reliance.' Of Colonel Gordon, the commandant of Eger, the Marquis is not so certain, and fears that 'this officer's Calvinistical spirit will make a rebel of him.' The Italian, unfortunately, paid that spirit too high a compliment by this suspicion. Wallenstein and his escort halted the first night at Miess, and arrived on the following evening at Eger, the last Bohemian fortress on the road leading into the Palatinate. Colonel Gordon, a Scottish Presbyterian, held the post with the regiment of Terzka, of which he was lieutenant-colonel, of which another Scotchman, of the name of Leslie, was major. Neither of these officers had yet heard of the emperor's proclamation, and Major Leslie was sent out to meet Wallenstein, and to conduct him into the fortress. The fugitive general took up his quarters at the mayor's house, in the marketplace; and, thinking himself in perfect safety, communicated to our three unworthy countrymen the cause of his being obliged to fly and seek safety with the allies: he left it to them to accompany him or not, as they might think proper. Gordon and Leslie agreed at first to follow him; but at a conference which they held during the night with Butler, the latter shewed them the emperor's proclamation, and the order which he had received from Piccolomini: on which they, unfortunately, came to a very different resolution. What was the exact order produced by Butler, is not known; but, from a passage in one of the Marquis de Grana's letters, its purpose may be easily conjectured. That worthy Italian, in recommending Colonel Teufel to the emperor for a vacant regiment, says, that he was one of the first who offered to 'murder the tyrant,' (*di ammazzare il tiranno*) and Ferdinand, 'delighted' with the

\* This was Carve, the author of the Itinerary, the same who, after Butler's death, was chaplain to Devereux; for all these men had chaplains. Carve was among the number of those who had shared in the bounty of the merciful Duke of Friedland; and, in a list of donations still preserved, is the following entry: 'To Thomas Carve, *Hybernus*, 5 florins on a petition for alms.' It is hoped that the comparative smallness of the sum,—for in the same list very large sums are specified as bestowed upon other persons—facilitated, to the worthy chaplain, the task of granting absolution to the murderers of the donor.

colonel's 'honour and bravery,' promises to grant the request. Butler, we may, therefore, conclude, had direct instructions to kill his general, and had, no doubt, authority also to promise ample rewards to those who should aid in the deed. He found, unfortunately, too many willing accomplices; and it is painful for a British writer to add, that they belonged mostly to his own country, the fair fame of which is deeply stained by the infamy of their crime. Gordon, Leslie, and Butler, having pledged themselves to the murder by an oath, which they swore over their drawn swords, Butler brought seven other officers into the conspiracy: these were, Geraldine, Devereux, Brown, Macdonald, Birch, Pestaluzi, and Lerda; the first five were Irishmen belonging to his own dragoons, and the last two Spaniards, captains in Terzka's regiment. The execution was fixed for the following evening; and, as Illo, Terzka, Kinsky, and Neumann, were to sup with Gordon in the citadel, it was resolved to commence with them, as it was well known that Wallenstein never joined such convivial parties. No sooner had the guests entered the castle on the fatal evening, than the gates were closed, and guards posted so as to prevent all egress. Captain Geraldine was stationed, with twelve dragoons, in an apartment that opened into the supper-hall, while Captain Devereux, with six more, stood in the apartment exactly opposite. To prevent noise the soldiers were without fire-arms, and were ordered to use their swords only. Not a shadow of apprehension seemed to cloud the party: the wine circulated briskly, as was wont in that bold, jovial, and boisterous time, and the guests were in high spirits at the thought of being beyond the reach of their enemies. The easy frankness of the conspirators disarmed suspicion; but the idea of men supping tranquilly with their intended victims, offers a fearful proof of the callousness of which the human heart is capable. No sooner had the dessert been placed on the table, and the servants dismissed, than the signal was given. Geraldine instantly burst in at one door, exclaiming, '*Viva la casa d'Austria!*' while Devereux entered at the other, asking, 'Who are good Imperialists?' Butler, Gordon, and Leslie, sprang from their seats, drew their swords, and called out, '*Vivat Ferdinandus!*' on which the dragoons rushed, at once, upon the designed victims, as bloodhounds rush upon their prey. Kinsky was the first who fell; Illo was stabbed through the back in attempting to reach his sword, which hung suspended against the wall; Terzka alone contrived to get his sword, and, throwing himself into a corner, resisted with the fierceness of a lion at bay. He reproached Gordon and Butler with their baseness, challenged them to single combat, killed two dragoons outright, disarmed Devereux, and mortally wounded Captain Lerda, before he sank beneath the blows of the assassin band. Neumann had fallen, wounded, under the table, and in the confusion escaped out of the hall; but, not knowing the counter-sign, was cut down by the castle guard. The first act of the tragedy thus concluded, the principal conspirators proceeded to hold another council. Long habits of submission and obedience,—the fame, greatness, and power of their victorious chieftain,—and the deference with which his subordinates had invariably looked up to Wallenstein, as to a being of almost superior nature, avowed for a moment even murderers, whose hands were yet dripping with the blood of noble and innocent men. Their council was of short duration. Gordon

raised a feeble voice in the cause of humanity; and, though he hinted that those might rejoice in the murder who would yet punish the murderers, his scruples were overruled by Butler, who better knew the parties he had to deal with. It was not very clear, indeed, that the duke could be arrested: but it was evident that he would not prove an acceptable captive at Vienna. As a fugitive outlaw, he was no longer dangerous to the house of Austria; but his escape might be dangerous to those who should connive at it, and would certainly bring them no reward: his death was the most agreeable service that could be rendered to the emperor; and avarice, therefore, sealed his doom. Two shots having been fired at one of Terzka's servants, who had escaped from the citadel, Leslie made the soldiers of the main-guard renew their oath of fidelity to the house of Austria, admitted a hundred more dragoons into town, and caused them to patrol the streets, and maintain the most perfect stillness. Towards midnight, Butler, followed by Devereux and six dragoons, proceeded to Wallenstein's quarters; and, as it was not unusual for officers of rank to call upon the general at late hours, the guard allowed them to enter. Devereux, with his party, ascended the stairs, while Butler remained below to wait the result. It is said that Wallenstein had, only a few minutes before, dismissed for the night an Italian astrologer, of the name of Senni, who was then attached to his household, and who declared that the stars still hoded impending danger, which Wallenstein himself either could not or would not see. He had just retired to bed; and the servant who had undressed him was descending the stair, when he met Devereux and his party, and desired them to make less noise, 'as the duke was going to sleep.' 'But this is a time for noise,' shouted Devereux, as he pressed on. Finding the door of the bed-chamber locked, he burst it open with his foot, and entered, followed by the soldiers. Wallenstein was standing at the window; startled by the screams of the ladies, Terzka and Kinsky, who lodged in the house opposite, and who had just learned the murder of their husbands, he had opened the casement, and was asking the sentinel what was the matter, at the moment Devereux broke into the room. The sight of his long-honoured and long-obeyed commander arrested not the hand of this bold and ruthless assassin. 'Thou must die,' he exclaimed; and Wallenstein, true to his pride of character, disdained to parley, even for life, with a slave and a stabber. Dignified to the last, he threw open his arms to the blow, and sank, without a word or groan, beneath the first thrust of the traitor's halberd, the blade of which went right through his breast. Thus fell a man who, as Gualdo says, 'was one of the greatest commanders, most generous princes, and most enlightened ministers of his own, or of any preceding time;' and thus ended the work, for the successful termination of which the emperor had caused prayers to be offered up in all the churches of the capital. The body was immediately rolled in a carpet, and carried to the citadel, where it was deposited along with the others. They were all, next morning, placed in hastily constructed shells, and conveyed to the castle of Miess. Piccolomini ordered, indeed, that they should be sent to Prague, for the purpose of 'being exposed,' as he tells his worthy colleague, Grana, 'in the most disgraceful situations.' But even Ferdinand retained sufficient sense of decency to prevent such an unworthy proceeding: he directed that the body of Friedland should be given up to his friends,

and that the others should all, with the exception of Neumann, be interred in consecrated ground. The last was, on account of his 'slandrous tongue,' to be buried beneath the gibbet. Wallenstein's remains were deposited in the vault of a Carthusian convent, which he had himself built, near Gitchen. When, in 1639, the Swedes penetrated into that part of the country, the celebrated General Banner caused the coffin to be opened, and took out the skull and right arm, which he sent to Stockholm. No sooner was the death-blow struck than Butler sent an account of it to Gallass, and, with hands stained in Terzka's blood, already begged for Terzka's regiment. Major Leslie carried the report to Vienna. The emperor, though unable to find the right word for the proceeding at Eger,—having, with his own hand, twice altered the draught of the original answer to Gallass, and effaced the words, 'killed' and 'slain,' before he fixed on the term, 'cut down,'—well knew how to reward the service he dared not describe; and could be liberal, at a moment when he had so rich a legacy at his disposal. Leslie was made imperial chamberlain, captain of the body-guard, and colonel of a regiment: he was raised to the dignity of count, and presented with the lordship of Neustadt, in Bohemia—an estate valued at 200,000 florins. The moment Butler heard of the emperor's generosity, he also hurried to Vienna, and, as it proved, had ample cause to be satisfied with his journey. Ferdinand gave him a public reception, shook hands with him, and made the Archbishop of Vienna suspend a gold chain round his neck. Like Leslie, he received a regiment and the gold key of chamberlain, was raised to the dignity of count, and obtained all Terzka's Bohemian estates. The estates of Kinsky fell to Gordon's share; and Devereux, who, with his own hand, had slain the Duke of Friedland, was rewarded with a gold chain, and with several confiscated domains. Every private soldier who aided in the murder received 500 crowns. Captain Geraldine got 2000, and the other officers 1000 each. Assassination has seldom been so richly rewarded as on this occasion; and the emperor, having estates to the value of nearly fifty millions of florins at his disposal, was as liberal to the original instigators of the murder as to the murderers themselves."

*Portraits of the Children of the Nobility.* A Series of highly finished Engravings, executed under the Superintendence of Mr. Charles Heath, from Drawings by Alfred E. Chalon, Esq. A.R.A. and other eminent Artists. With Illustrations in Verse by distinguished Contributors. Edited by Mrs. Fairlie. First Series. Folio. London, 1837. Longman and Co.; Paris, Delloy and Co.

THIS pretty volume is dedicated, by permission, to the queen; and its fair Editor has contributed one illustration of three stanzas to its poetical contents, to justify her appearance in that character. Of the other nine subjects, two are commemorated by Lady Blessington, and one each by Capt. Marryat, L. E. L., James Smith, H. L. Bulwer, B. D'Israeli, W. B., and Lady Emmeline Wortley. The nature of such performances forbids criticism. A graceful thought or two, a moral reflection, or an aspiration for the happiness of the tender creatures whose images are thus enshrined by art, are all that the most fastidious could require; and, truly, we find these qualities in the dozen or fifteen pages before us. Henry Bulwer's lines on the daughter of his schoolboy friend, Sir William Somerville, are playful;

those by B. D'Israeli on the three children of Lord Lyndhurst, are touching by their reference to a dead sister; and W. B., the anonymous celebrator of the three wee laddie scions of the house of Buccleuch, is happy in his genealogical and national allusions. Capt. Marryat has taken a fine model for imitation in Herrick: and James Smith has elaborated a most classical story into the service of the charming girls of His Grace of Beaufort. As samples we cannot do better than copy Lady Blessington's sweet and apposite lines on the children of the Earl of Wilton (a boy and girl), and L. E. L.'s verses on the daughter of Lord Canterbury; though, perhaps, the engraving should be seen in order to feel how peculiarly applicable they are to the interesting original.

*"The Portraits of Viscount Gray De Wilton, and Lady Elizabeth Gray Egerton, Children of the Earl of Wilton. By the Countess of Blessington.*

Achilles, in the days of old,  
Disguised at Syros, as we're told,  
In female garb, his sex betrayed.  
When sword and helm he saw displayed,  
E'en thus a boy, though babe he be,  
The manly taste will let us see:  
In sword or gun he takes delight,  
To arm him for the mimic fight;  
And ere the urchin will can walk,  
Of horse and dog he loves to talk.

No such bold thoughts the girl perplex:  
True to the instincts of her sex,  
With all a mother's fondness blest,  
She presses to her infant breast  
The darling image of a child,  
And hush to it in accents mild.  
Thus ever, nature in the heart,  
Unchecked, unchanged, asserts her part,  
And different duties prompts to each,  
Ere time and reason gravely teach.

Fair branches of a noble tree,  
Oh! may you, when matured ye be,  
Fulfil the promise now you give,  
And honoured, loved, and happy live,  
To shew, where'er ye take your stand,  
Among the proudest of the land,  
What praise is theirs, what love, what charms,  
Who trust in virtue, not in arms."

*"The Portrait of the Hon. Frances Diana Manners Sutton, Daughter of Viscount Canterbury. By L. E. L.*

Her hands are filled with early flowers, the lily and the rose,  
The violet, that at the foot of some old ash-tree grows;  
And hyacinths, the deep, the blue, within whose purple bells,  
A history of the olden time, a classic sorrow dwells.

Her eyes are not upon them—her deep and earnest eyes,  
Where something not like childhood's thought in shadowy silence lies:  
Her eyes are not upon them; and yet they fill her soul  
With all the dreaming fancies that own their sweet control.

The sweet control of Nature, it teacheth that fair child  
To love the true and beautiful, the dreaming and the wild;  
I feel those downcast lashes oft drop unbidden tears:  
How many things are in that face for anxious hopes and fears?

To think,—to feel,—alas! how much is said in these brief words!—  
The music and the misery of life's divinest chords.

To think,—to feel,—it is that makes the suffering on this earth;  
And yet are they immortal signs of an immortal birth.

Upon that young and serious brow is feeling and is thought,  
[brought:]  
With all the dreaming poetry by summer blossoms  
What hath the future in its hours, thou gentle girl! for thee?

An anxious and a lovely thing, that opening mind will  
There are the hopes that rise at first upon the skylark's wing;  
[sing:]  
Alas! unlike that skylark's song, they sadden as they  
The generous confidence that writes upon life's first bright line.

The kindly impulses that make the fervid heart a shrine.  
Long may they linger at thy side: for hope, and youth,  
[above:]  
And love—  
These are the angels that bring down their heaven from  
A blessing, holy, infinite, beneath such presence lives;

'Tis thine, if that fair face but keeps the promise that it gives."

*Gwaith Lewis Glyn Cothi. The Poetical Works of Lewis Glyn Cothi. 8vo. pp. 280. London, 1837. Hughes.*

IN the last edition of Calmet's dictionary, men-

• • • Virtute non armis fido, the family motto."

tion is repeatedly made of the Welsh Triads; that they were not known to the English until very recently, and that they were of very great importance in a historical point of view, in throwing a light upon the history of Britain in the early and dark ages, when scarcely any other work gave authentic accounts of those times. The same might as justly be said respecting the above work, the poems of Lewis Glyn Cothi, which have not seen light for centuries until the present day. This celebrated bard appears to have lived in a place called Pull Tinbyd or Glyn Cothi, in Carmarthenshire, in the reigns of Henry VI., Edward IV., Richard III., and Henry VII.: his poetic work is in the difficult metres, as they are termed, and the greatest part very ingenious and excellent, and is, consequently, sure of being duly appreciated by the Welsh bards. Having been composed so many centuries since, and being, at the same time, intelligible in the present day, it is recommended to the notice particularly of young bards, for their instruction in poetical language, in order to nourish and cultivate which they will do well to imitate Lewis Glyn Cothi. The work is also particularly valuable as a historical document worthy the attention of all who feel interested in the history of our country. At the period Lewis lived the poetry chiefly consisted of elegies, addresses, &c. to the most celebrated characters, and records many commendable deeds done by them and their families, &c. thus throwing much light on the history of both England and Wales. To make those parts more intelligible than in the original verse, there are added copious notes in English, explanatory of the author's references. There is also a curious genealogical table shewing the different families of the era; and it should also be mentioned, that the work was prepared for the press under the auspices of the Cymmrodorion Society, and the English notes written by two of the most celebrated scholars of the present day, the Rev. Walter Davies, Mynafon, and the Rev. John Jones, Oxford. The principality, and the public generally, might be assured that nothing of a trifling nature could appear estimable under the sanction of these celebrated divines.

*Observations on the Structure and Functions of the Spinal Cord. By R. D. Grainger, Lecturer on Anatomy, &c. 8vo. pp. 157. London, 1837. Highley.*

SOME correspondence lately took place, and excited the public attention in the daily press, upon the supposed cruelty of certain experiments made by Dr. Marshall Hall upon a turtle, which turtle had its head previously cut off. We should, perhaps, startle some of our readers were we to tell them, that, by touching a decapitated body at particular points, most of the ordinary signs of life, such as motion, recoiling, &c., can be produced; yet that there is no more sensibility in the trunk than there is in the convulsed body of a guillotined criminal, or in a headless eel, flayed, as it is erroneously called, alive. It is well known that a domestic cock, skilfully decapitated, can be made afterwards to walk a certain distance; a male cricket has been made to exhibit the same phenomenon; and a large fly will take to its wings under similar circumstances. A common frog has been seen to make attempts, after decapitation, to remove an instrument by which it was irritated; and another animal employed its feet in removing a source of irritation from the face, caused by plucking a hair of the whisker, or by dropping acid on the nose. Now, the point

was to distinguish these curious and interesting phenomena from sensation and volition; and the fact of accomplishing this distinction is among the very latest additions to science, and is of most extended importance to anatomy, to physiology, and to the treatment of diseases.

It was only in late years that the distinction between the nerves of sensation and those of volition was established, with a superadded set, by Sir Charles Bell. Anatomists were aware of the distinction in the spinal cord, of the medullary, or fibrous, and the gray, or cineritious portions: Drs. Gall and Spurzheim had even supposed the one to be generated by the other,—a fact which, although not accordant with what has been shewn by more recent researches, does not, we may observe, at all militate against the divisional functions of the cerebrum; but, still, the real seat of sensation and volition had not been determined—one party supposing it to reside in the medulla oblongata; the other, in the cerebellum. This indecision regarding the seat of sensation was entirely owing to the phenomena produced after decapitation, or the removal of the cerebrum and cerebellum, and which have since been designated as excito-motory, being confounded with such as are the result of sensation. The knowledge of this latter system enables us at once to refer the seat of sensation and volition to the brain, and to seek, in other structures, for the explanation of movements and actions which have hitherto only puzzled the experimental physiologist.

The result of researches, made now some time back, had distinctly shewn that the spinal cord, quite independently of the brain, possesses a property in virtue of which it is able so to transmit impressions made on the skin as to excite definite muscular contractions; and Magendie, Le Gallois, Desmoulins, and others, had connected this with sensation. Mr. Mayo, in 1823, had made a step to separate this from a phenomenon of sensation and volition, by characterising it as an influence propagated from the sentient nerves of a part to their corresponding nerves of motion, through the intervention of that part alone of the nervous centre to which they are attached. This is what has since been denominated the reflex action, and it remained for Dr. Marshall Hall and Professor Müller to be the first clearly to announce that what have been designated the excito-motory phenomena are totally independent of sensation and volition; and which distinction was accomplished by a profound spirit of physiology, unaided by the scalpel. It is gratifying, then, to find, that a person so well adapted for carrying on the investigation with success as Mr. Grainger should have taken up the subject, and, as a result, have produced the little volume before us, which contains the description of an hitherto unobserved set of nervous fibres, which part from the anterior roots of the cerebral and volition fibres, and which he calls spinal, or reflex; and another set, from the posterior or sensiferous roots, and which are also spinal or incident fibres. Both sets dip into the gray matter of the cord, which hence becomes the true spinal cord. The influence which this discovery of an excito-motory system, independent of sensation, and of the structure with which it is connected, will be of the first importance to many branches of knowledge. It is doubtful if it will not lead to the conclusion that, in many of the lower animals, such as do not possess a rudimentary cerebrum or cerebellum, the motions and vital acts are not, as in plants, mere physical instincts, unaccompanied by sensation or volition. The established identity of the gangliated thread of the articula with the

spinal cord of vertebral animals realises Sir Charles Bell's idea of a series of nerves subordinate to sensation and volition, and opens a new and a wide field of inquiry. To physiology, the present facts are also of the greatest interest, and promise much in bringing that science to depend on, at least, a few more definite and general laws; and, in the treatment of disease, it is obvious that they stand prominent among all that has been done for many years.

## MISCELLANEOUS.

*Rise and Progress of the British Power in India.*

By Peter Auber, M.R.A.S., late Secretary to the Court of Directors. In 2 vols. Vol. II. 8vo. pp. 713. London, 1837. Allen and Co. DRAWN from authentic documentary records, the historical view which is completed by this volume, is one of great value and utility. From 1784, the date of Mr. Pitt's famous bill, to the surrender of the company's charter in 1833, when, retaining their political character, all the rest was sold to government for 630,000*l.* a-year, and a guarantee fund; the author follows the stream of time, and relates the events which occurred,—the wars with Tippoo—the expedition to Egypt—the Mahratta war—the taking of Bhurtপুর—the mutiny at Vellore—the throwing open the India trade—the Burmese war, &c. &c.; and in a clear, though brief manner. A coloured map, on a small scale, affords a distinct view of the vast British acquisitions and power in the east; and, indeed, for general data, Mr. Auber's work is one indispensable to the knowledge of this extraordinary colonial empire. It is droll that, in so grave a book, we should have stumbled on a tolerable bull. When the army proceeded against Prume, in Ava, the author says, "General Shuldham was advancing amongst impenetrable jungles towards Munnipore;" which was, certainly, a high proof of military skill in the gallant general, and not surpassed even by the illustrious exploits of Wellesley himself, to which these pages, like Gurwood's "Correspondence," bear such splendid testimony.

*The Naval Keepsake, 1838.* Pp. 486. London, Colburn.

THIS volume presents us a Life of Nelson, illustrated with anecdotes and notes, "by an Old Sailor" (the popular author of many eminently characteristic naval productions); and is thus, even after the admirable biography of Southey, well worthy of public attention. Some of the original notes are curious and interesting.

*Literary Varieties; a Selection of Papers from several Finished and Unfinished MSS.* By W. Mackenzie. Pp. 407. Glasgow, 1837. M'Phun; London, Coles.

MR. MACKENZIE appears to be a surgeon in the army, and to have seen much of foreign parts. Tours in Kaffer-land and Morocco are very agreeably written; but the collection is made up of graver essays, anecdotes, characters, tales, fables, &c. &c. of great variety. The whole together form a very pleasant desultory book, for young and old.

*Alison's History of the Revolution, &c.*—We have only to add to the notice in our last, that this volume (VI.) embraces the eventful period from December 1806, and the battle of Eylau, to 1808, and the battle of Corunna.

*Sir George Head's Tour in the Manufacturing Districts.*—Since our last, a new edition of this clever volume has been placed before us, which we need not further recommend than by referring to that Number of the *Gazette*.

## ARTS AND SCIENCES.

## SOCIETY OF ARTS.

THE evening illustrations for the session 1837-8 commenced under promising auspices on Tues-

day. The large room was crowded. The exquisite casts which occupy the angles of the room, as well as Barry's magnificent paintings, which cover the walls, having been recently cleaned, there was a lightness, comfort, and elegance about the *ensemble* quite refreshing. The subject was calico-printing, by the secretary, which, notwithstanding its apparently uninteresting character, was listened to, as it deserved, with much attention. After noticing the antiquity of calico-printing, Mr. Aikin proceeded to observe, that in 1676 the art was brought to this country from Holland, and several manufactories were soon established in the neighbourhood of London, on the side of those streams which afforded the best supply of clear and pure water. Stratford-le-Bow, celebrated for its dying establishments, was one of the earliest seats of the new manufacture, as also was Merton and various other places on the banks of the Wandle. The material, *i. e.* the calico, was imported in the white from India; and so generally acceptable to the public were these imitations of the real chintzes, that a very large and continually increasing quantity was required to supply the demand. At length, the weavers of silk and woollens became alarmed by the actual, or apprehended, diminished demand for their own articles; and in 1721 they obtained from the legislature an act (7 Geo. I.) "to preserve and encourage the woollen and silk manufactures." This act prohibited, under severe penalties, the wearing of Indian printed calicoes: thus cutting off the whole home market, and leaving to the calico-printers only the export trade. In order to recover possession of the home market, the printers endeavoured to substitute linen cloth for cotton, but with very imperfect success, in consequence of flax being much less apt than cotton to receive dyed colours. In an article, at that time only made in Lancashire and Cheshire, and called *cotton*, they found a material far better adapted to their purpose. It was at that time a coarse fabric, the warp of which was flax, and the shoot a bulky and loosely twisted thread of cotton. A demand, however, thus suddenly springing up for cottons as nearly approaching in texture as possible to Indian calico, soon effected an improvement of their texture; and about 1731, the printing on cottons and linen of British manufacture became common amongst us; so much so, that Postlethwaite, who published his Dictionary of Commerce in 1751, says in it, that "our cotton and linen printers are not less numerous than before the act took place." From Holland the art of calico-printing extended itself chiefly along the banks of the Rhine, quite into Switzerland: but in France it seems for many years to have been totally neglected; for, in the folio edition of the French Encyclopædia, published in 1765, though there is a good account of the method of printing cloth in imitation of Indian chintzes, it is only said to be practised "in Holland and elsewhere," no French localities being mentioned. In 1773, real calicoes, that is, cloth having both the warp and shoot of cotton, began to be made in England; and this, at length, put our printers in possession of a fabric of precisely the same material as that employed by the Indian artist. Mr. Aikin then cleverly illustrated, by chemical experiments, the methods of communicating colours of different descriptions to different parts of the calico. He next pointed out the substances employed by the printers, such as Brazil wood, cochineal, indigo, &c.; then described the Indian method of chintz dying; likewise the European method of printing in its earlier and more simple state; and,

finally, Mr. Aikin concluded his discourse by an enumeration of the dying materials employed by the calico-printer at the period to which the lecturer brought down the history of the art. The chief of these materials is indigo, which gives only a blue colour, perfectly fast, if applied in the de-oxygenated state; and madder, the most solid and durable of all the red dyes. There was a splendid collection of seedling chrysanthemums from Jersey, in the anteroom. The specimens were equal in beauty to those of China, which, until now, had been considered unique.

## GEOGRAPHICAL SOCIETY.

Nov. 13. Sir Woodbine Parish, V.P. in the chair.—This being the first meeting for the season, was numerously attended, and especially by Arctic navigators, as Sir Edward Parry, Dr. Richardson, &c., to greet the return of Captain Back from his late remarkable voyage. We noticed also Prince Musignano, from Florence, and Baron Charles Hügel, of Vienna. Numerous donations of books and maps were announced; several new candidates for admission were proposed; and Colonel Lapie, of the Dépôt de la Guerre, at Paris, and Don Pedro de Angelis, of Buenos Ayres, were elected foreign corresponding members.—Read extracts from various papers. 1st. From Capt. Alexander, dated Aug. 18, at Comaggas, a missionary station between the Kousie and Zwaartlinjies rivers, announcing his safe return to that place, after having travelled to the northward, up the Fish river; thence crossed the tropic; reached the parallel of 22° 55' south; and made the sea coast at Walvisch Bay. Six months had elapsed without any intelligence of the party, and during this time they had been almost constantly without bread, and occasionally without salt to eat. Rhinoceroses, lions, camelopards, &c. had in turns furnished them with food: they had incurred much risk from wild beasts, their fires, which surrounded the camp at night, not being sufficient at times to prevent their intrusions. After a short halt to repose his men and cattle, Captain Alexander was to start for Cape Town. 2dly. From Mr. Schomburgk, at Demerara, stating that he had returned from his ascent of the river Berbice, which he had explored as far as 3° 50' north lat., where he had crossed by land to the river Essequibo, a distance of only ten miles in that parallel. He describes the same general luxuriance of vegetation which he had met with on the other rivers of British Guayana; but the most striking object here discovered in the vegetable kingdom, was the gigantic water-lily, with leaves six feet, and fragrant flowers fifteen inches in diameter, called the *Victoria Regia*, in honour of the queen. [See our Report of the Botanical Section of the British Association in September last.] It is supposed to be the same as the plant called *Euryale amazonica*, by Dr. Poeppig, who met with it on the River Amazons: but it is a distinct genus, in the opinion of Professor Lindley, who has printed, for private distribution, a short account of it, now in the library of the Geographical Society. By the latest accounts from Demerara, dated Sept. 12, 1837, Mr. Schomburgk was to start on the following day for William IV.'s cataract on the Essequibo, in 3° 14' lat. with the intention of exploring that river to its sources, and then to continue the examination of the range of mountains called the Sierra Acaray, believed to be the line of separation of water between the basins of the Essequibo and the Amazons; and eventually, it is hoped, he may be enabled to connect the

positions of the French on the east, with the observations of Baron Humboldt near Esmeralda, on the west. 3dly. On the north-eastern shore of Southampton Island, by Captain Back, R.N. It need hardly be stated that the chief interest of the meeting consisted in the expectation of hearing some further accounts of the recent voyage of H. M. S. Terror. As the brief narrative of that voyage has already been made public (see *Lit. Gaz.* Sept. 16), it need not here be repeated. "The name of Southampton Island (says Captain Back), has become too familiar, through modern voyages of discovery to the north, to require any description of its locality; and there are few persons who are not aware that Sir Edward Parry and Captain Lyon sailed on either coast, north and south, on their course to Repulse Bay. Long before their day, as far back as 1615, Bylot and Baffin also visited the same north-eastern part of the island, but no chart was, I believe, published of their voyage; and, as Sir Edward Parry made the land about Cape Comfort in lat. 64° 50' N., the intervening space of about 120 geographical miles, comprehended between that cape and Seahorse Point, its eastern extremity, remained a blank on our maps, until the extraordinary situation of H.M.S. Terror, thrown on the surface of ice, and forcibly carried by it along the whole line of coast, enabled me to fill it up. The impracticability of forcing a passage into Repulse Bay, by keeping as near as possible to Baffin's Island, being manifest by repeated failures, with considerable difficulty and much pressure, from the heavy and closely packed ice by which we were beset, we gradually approached Southampton Island. The frost smoke that attended us vanished as we drew near, and the dark lanes of water from which it originated closed firmly, to the utter impossibility of proceeding one yard further. Left, therefore, to the influence of events, we were borne backwards and forwards according to the eccentric movements of the ice, crowding sail when the least crack shewed a probability of an opening, or, with the aid of saws, axes, and ice-anchors, warping a few paces, until the most closely packed ice finally arrested our progress, twelve miles from Cape Bylot, when only fifteen more would have enabled a safe wintering ground in Duke of York's Bay. Proceeding to the S.E. from the sloping yet bold outline of Cape Bylot, the land is high and irregular, full of sinuosities and bays, bounded by abrupt precipices and shelving acclivities. Fifteen miles further, the coast is more broken into hill and valley; and rivulets and mountain-torrents find their way to the sea. Four miles to the eastward, the coast line becomes more craggy, and, turning abruptly to the south, forms Smyth's Harbour. There seemed, at one time, to be a distant chance of our getting into this snug place, for a long and broad sheet of young ice was formed in-shore of us, and afforded the hope that nothing more formidable would impede the passage into the harbour,—but in vain. The rocks around are composed of granite, containing a large proportion of rose-coloured felspar, gray quartz, and blackish mica, in small scales; and are traversed by numerous ravines, thickly covered with snow. But the point most deserving notice was a fine imposing perpendicular cliff, six hundred and fifty feet high, from which there was the most beautiful echo imaginable; and its charms were so attractive, in that monotonous solitude, as to lead many from their ordinary occupations for the mere novelty of hearing the stranger-like accents of their own softened voice. Be-

yond these hills, others rose to about 850 feet, backed by a further inland range, attaining to fully 1600 feet. The tracks of bears, foxes, and deer, were seen in the valleys, which produced a few miserably stunted willows, the occasional resort of a solitary brace of white partridges. Eight miles from Smyth's Harbour is a wide open bay, where I landed. Near a watercourse was a circle of stones, evidently used, a long time ago, for the purpose of extending an Esquimaux tent, denoting, clearly, that the place had formerly been frequented by these people. The mountains varied in height from 1400 to 1600 feet; one side was invariably precipitous, and the dip nearly at right angles to the horizon. I looked in vain for any of those upright stones, so plentifully set up as marks to cross the country, where the inhabitants are numerous, and which strike the eye of a stranger as very curious, when travelling through the interior of the continent, from the barren land to the sea-shore. The lower lands here were uncommonly sterile, hardly affording sustenance for the Alpine hare, while the ledges and summits above were clothed with grass, on which two rein-deer were feeding; while thinly scattered shrubs, of stunted growth, and here and there a grand willow, relieved the eye from the monotonous and pallid glare of snow around. To the eastward the coast is sterile and forbidding, with a peculiarly wild and dark aspect: two of the most conspicuous summits distinguish the headland known by the name of Cape Comfort. From it, the land trends away more to the south; and the tide and current produce a commotion here that nothing can withstand. On one occasion, when the ice in which the Terror was imbedded, by some unaccountable convulsion, was turned round, we were carried within a short mile of the towering and perpendicular front of the cape, which just there was rent into innumerable fissures, alternating with jagged and splintery projections of the most fearful description. Though there was but little wind at the time, the ice was driven bodily against the rocks, and, rising up in masses of many tons weight, became reduced to fragments in an instant. Happily for us, after losing a few hundred yards of our floe, it drifted onward past the danger, and thus relieved me from further anxiety on that day. Further to the eastward, Cape Fisher rises 750 feet above the sea. Hereabouts there was a want of vegetation, unusual even in these regions; and a more decidedly sterile scene, in the fullest acceptance of the phrase, could not well be imagined. Nor was it merely local: for some rather long excursions were made inland in search of animals, without success; and, in the course of the journeys, only a few scattered patches of moss and short grass were seen, and not a living thing of any description. Thirty-two miles beyond Cape Fisher, the hills gradually decrease as they turn away south, until they are lost at Point M'Murdo, which is the western entrance to an extensive bay, inlet, or strait, which, from the strong set of the current into it, is probably connected with Evans' Inlet, on the east side of the island. The coast, from Point M'Murdo, resumes its mountainous outline; and here are two domelike summits, which distinguish it from every other part; Mount Minto, which is the highest, attains upwards of 1000 feet. Projecting from this is a low range of hills, forming Terror Point, so named from its being the place where the sternpost was carried away, and the ship sustained the greatest damage. Twelve miles beyond Point Saunders, and close to Sir James

Gordon's Bay, the high land terminates, and disappears altogether in two small islands, immediately to the south-east of which is Seahorse Point, the eastern limit of Southampton Island." The chairman, in proposing a vote of thanks to Captain Back for the narrative of his voyage, and for this latter communication, was sure he did but express the feeling of the meeting in general, in saying that, considering the unforeseen physical obstacles that opposed themselves to his progress, Captain Back had done all that could be done, and had most conscientiously fulfilled his duty in making his chief object the safety of those committed to his charge; and he begged to offer to him, to his officers, and to his crew, the sincere and cordial congratulations of that meeting on their safe return to their country and their friends. Yet, as the tracing the northern shore of America was an object that never could be lost sight of by the Geographical Society, he appealed to the distinguished arctic navigators present to state whether there was any thing in the account they had just heard to prevent, at some future day, such an object being carried into execution. Sir Edward Parry was happy to have it in his power to bear his testimony to the fact, that, in the long experience he had had in the polar seas, he had never known any similar occurrences to those related to him by his brother officer and friend, Captain Back; that on his voyage, in 1821, to Repulse Bay, no difficulties to be compared to these were encountered; that it appears that both the last and the preceding were unusually severe seasons; but that he had no hesitation in recording his unaltered opinion as to the practicability, under ordinary circumstances, of completing the outline of America, when once a party should have reached, as a starting-point, either Repulse Bay or Wager River.

#### ENTOMOLOGICAL SOCIETY.

Nov. 6th. J. F. Stephens, Esq. president, in the chair.—Numerous donations of entomological works were announced, and thanks ordered to be given to the several donors thereof. The following memoirs were read:—1. Notice of the recent occurrence in London of the *Pinus hololeucus* of Fuldermann, by Mr. Bainbridge. 2. Description of a new subgenus of exotic hemipterous insects, by Mr. J. O. Westwood. 3. On some peculiarities in the structure of the wings of the *Hemiptera*, by Mr. R. J. Ashton. 4. Account of the production of hybrid specimens between *Smerinthus populi* and *Sm. ocellatus*, by Mr. H. House. These curious specimens were exactly intermediate, in their general appearance, colours, and markings, between their two parents; and, although the individuals exhibited had the external appearance of belonging to the masculine sex, some circumstances were mentioned which seemed to shew that, in regard to their sexual characters, they partook of the nature of hermaphrodites. 5. Notice relative to the ravages of a species of *Asiacampsis*, in the caterpillar state, in a granary near Bristol; and to the destruction, by a species of *Dormestes*, of a collection of objects of natural history: communicated by Mr. Raddon. An extensive and valuable collection of insects, from Albama, was exhibited by Mr. W. W. Saunders.

#### ZOOLOGICAL SOCIETY.

Nov. 14th. Professor Bell in the chair.—Dr. Martin Barry, of Edinburgh, exhibited to the meeting a living specimen of the *Proteus anguinus*, which he had received from Professor Rudolph Wagner, of Erlangen, in Bavaria; and

he also communicated to the Society the results of some highly interesting microscopic observations undertaken by Prof. Wagner upon the globules of blood in this remarkable animal.—Lucien Bonaparte, prince of Musignano, brought forward a new arrangement of fishes, which he considered more natural than any systematic classification hitherto adopted. The number of orders into which he proposes to divide this tribe of vertebrate animals, is twelve.—Mr. Gray proposed some new divisions for the land and water shrews, and particularly directed the attention of the meeting to the distinctions existing in the external characters of this family, and which he considered of equal, or even greater, value, in dividing them into groups, than the characters furnished by a difference in dentition.—Mr. Blyth made some observations upon a group of owls, in which there was an apparent development of aigrettes, a fact hitherto unnoticed in the *Strigidae*.—Mr. Yarrell detailed a highly interesting fact communicated to him by the Earl of Derby, respecting some *Pediculi* which had infested, in great numbers, a harpy eagle in the earl's aviary, at Knowsley.—The meeting was numerously attended, and adjourned to the 28th inst.

#### MR. CROSSE AND HIS INSECTS.

[The following, from a provincial journal, shews that Mr. Crosse is not yet satisfied as to the question of his ancient mites.]

"Broomfield, near Taunton, Oct. 30, 1837.

"Dear Sir,—I send you, by my friend, Mr. —, a small bottle of spirits of wine, containing about thirty insects, produced in silicate of potash, under the long-continued action of weak voltaic electricity. I am quite as much surprised, and quite as much in the dark about this affair, as I was at first. I have had lately several new families of them, and have them at this present time growing on a piece of iron wire plunged into silicate of potash, and a quarter of an inch under the surface of the fluid, at the positive pole of a battery, consisting of twenty pairs of small zinc and copper cylinders. I likewise have them forming on the surface of constantly electrified sulphate of copper, at the edge of the fluid, and strangely mixed up with crystals of sulphate of copper. In fact, I have them in all stages, from their earliest formation to their full perfection, and crawling about pretty nimbly. Most of their formations took place in the dark. The access of light is very prejudicial to them, as far as I have observed. I have had hundreds of vessels of the same water as that used in the solution in the same room, and in other rooms, with not the slightest appearance of a similar insect, or the germ of one. In one of these experiments the vessel was covered with paper, and yet the insects were formed as before. Of course, I have no merit to claim in the affair. It was pure accident, and the looking for artificial minerals brought them to my notice. I am preparing an apparatus to repeat these experiments in a more unexceptionable manner, but have more difficulties to contend with than one would at first expect. Many of the remarks which have been made upon these formations would not have been made if the writers had been better acquainted with the circumstances attending them, and which, to say the truth, I have rather avoided noticing, from the wish I entertain of being myself better informed of the nature of these apparent mysteries. My friend, Mr. — has seen, and pretty closely examined, with a powerful lens, their different appearances, and they have been seen by a great number of persons. I write this in some haste; but, though this is a rough sketch, it is a correct one. I believe the

younger insects have only six legs, and when more advanced, eight; and this, I understand, not uncommon in the mite genus. You may make what use you please of this letter.

"I beg to remain, dear sir, yours truly,

"ANDREW CROSSE.

"P.S. Although these insects are formed either below the surface, or at the edge of an electrified fluid, yet, when once they have left it, they are drowned on falling into it."

#### LITERARY AND LEARNED.

##### THE LITERARY FUND.

AT the first meeting of the Literary Fund for the season, last week, we rejoice to state, that a letter from Lord John Russell to the Duke of Somerset announced her Majesty's gracious reception of the congratulatory address from that body, and her assent to become its protector and patron. Having enjoyed the same royal consideration since its foundation, and having been munificently sustained by the royal bounty of her Majesty's predecessors on the throne, as well as by the liberal support of both her illustrious parents, we look upon this act as one of peculiar fitness and grace. Assuredly, there is no institution existing in the British dominions which is so deserving of royal favour, as one which is devoted to the alleviations of the distress that ever has been, and ever must be, but too intimately connected with literary pursuits—with pursuits which adorn and immortalise the age, whilst their struggling votaries languish and perish. The dying dolphin sheds its most brilliant hues around as it dims into oblivion, admired and pitied by its captors: under our youthful queen we hope that such will not be the fate of genius; but that to admiration and pity will be added the nobler feelings of sympathy and love; and thus the sad colours of adversity be brightened into the sunshine of happiness.

#### CURIOUS ORIENTAL LITERATURE.

THE following papers relate to a curious piece of oriental literature, a production not only of such magnitude as to be intrinsically an object of high value in the world of letters, but originating in such striking views, and directed to such important results, as to claim upon other grounds no small share of public consideration.

These documents were lately delivered into the committee of correspondence of the Royal Asiatic Society of Literature, by the chairman, the Right Hon. Sir Alexander Johnston, the very able, zealous, and intelligent member to whom they were addressed, and who has so long and so efficiently filled its leading offices, as a proof of the great abilities and loyalty of the Persees of Bombay, and of the propriety of their being patronised by the Society. They are of considerable historical interest, and run thus:—

"Translation of a Letter from Mulla Rustom to the Right Hon. Sir Alexander Johnston.

"I have the honour very respectfully to represent to the Right Hon. Sir Alexander Johnston as follows:—Whereas the late Mulla Firoz, son of Mulla Kans Zertushtee, among the wonders of his poetic effusions, composed a poem, entitled 'George Nameh,' after the manner of the Shah Nameh of the celebrated Ferdusi, in the name and attributes of his late illustrious Majesty King George the Third, in which he has done justice to the poetry and literature of his time, and carried off the palm of victory over all his contemporaries in the

\* The introductory compliments in letters of this kind, however beautiful in the original, are utterly unsuceptible of translation. They are, therefore, omitted here.

field of poetic composition, by the imagery of his style, and the elegance and exuberance of his language, the beauties of his metaphors and allegories, and his luminous illustrations and allusions. That such a work—a work which may be regarded as the *chef-d'œuvre* of the age—should remain hidden and unknown to the world, appeared to me to be far from what is proper, judicious, and creditable. I have, therefore, had the work (which consists of nearly 40,000 verses) lithographed at Bombay in a fine hand, and an agreeable form, in three volumes, at the price of sixty Bombay sicca rupees, that the gratification which it is calculated to afford may be accessible to all classes of people; and for the better information of such English gentlemen and others as may not be conversant with the Persian language, I have translated into English, and printed, a prospectus of the narratives and events recorded in the book, and now transmit copies of it to you, sir, in order that you may be pleased to distribute them among persons of science and literature,† and that I may have the honour of transmitting to you such a number of the books as they may desire to have. I further take the liberty of requesting that you will have the goodness to send these, my representations, together with your own recommendation, to purchase the work in question, to English gentlemen of rank, and others; and publish the same also in the newspapers; charging the expense of such publication and the postage to my account, apprising me likewise of what is done. I am aware that I am taking a very great liberty; but I trust to your goodness to forgive me. I have further to state, that I do myself the honour of transmitting to you a copy of the book, entitled ‘*Dusateer*,’ with an English translation, that it may always have a place in your library; and I respectfully request your acceptance of it. I hope you will honour and gratify me by your much-esteemed letters, and by any commissions in my power to execute. May the days of your distinction, honour, and happiness, be perpetuated!”

This letter enclosed the annexed very characteristic announcement.

“Be it known to all persons of learning and knowledge, and of enlightened minds, that the occasion of the composition of this refined and extraordinary work of epic poetry, and its being inscribed in the illustrious name of His Majesty the King of England, was as follows:—Whereas, the disposition of the late Hon. Jonathan Duncan, the 28th governor of Bombay, led him to engage in elevated pursuits, and to patronise new and rare productions, his time used to be frequently devoted to the society of men of learning, science, and general knowledge, with whom he interchanged the communications of their extensive knowledge, and the suggestions of his own vigorous imagination. On one auspicious day, Mulla Firoz, son of Mulla Kans, had the good fortune to be introduced into one of these assemblies, at the residence of that highly distinguished and respected gentleman; where, in the course of the conversation, he manifested a decided superiority over all the company by the beauty of his language, and the eloquence of his discourse, and drew from them expressions of unbounded admiration and applause, especially from the governor, who, turning towards him with marked distinction and favour, addressed him as follows:—“I have read and considered most of the histories of ancient kings, but have

not found in any one of them that sweetness of diction and force of poetry by which the Shah Nameh is distinguished; truly, in that poem Aboul Cossim Ferdousi has carried elegance of composition to the greatest possible extent, and done justice to the utmost power of language; and, through the aid of his vigorous imagination, has erected a (literary) fabric of such an elaborate character, that no professor of poetry has ever yet been able to produce its equal: a sufficient illustration of the truth of this description is contained in the following couplet of Ferdousi himself:—

‘I’ve reared on high a proud poetic fane,  
Which storm and tempest shall assail in vain.’

Hence it is that his illustrious name rings in the ears of all mankind, and as long as time shall endure, all ranks of people will be enchanted by his mellifluous strains. How delightful it would be, if, in these auspicious days, when, by the fostering care of the noble delegates of the empire of His Majesty the King of England, the plains of Hindustan are rendered the envy of the gardens of Paradise, and the fame of their benevolence and justice has reached the ears of far and near, an author like unto that wonder of the age, should appear who would undertake to compose a poem on the subject of the first arrival of the English in Hindustan, their conquest of the country, and all the events of those times, and make the result of his genius thus exerted, an offering at the throne of his most gracious and most glorious Majesty, King George the Third!”

The eloquent and accomplished poet answered and said:—“This is a wish that can never be realised, an imagination of which the reality is hidden from the far-seeing view of intelligence, still, as it has been justly said,

‘There is nothing difficult which may not be rendered easy.’  
‘It is unbecoming a man to yield to apprehension.’

Whenever your excellency’s enlightened judgment shall be decided with regard to the promotion of this object, I confidently hope that this humblest of the worshippers of God may, by his devoted exertions, succeed in its accomplishment.”

The honourable governor, with the highest delight, and in the kindest language, said, “Oh! what celebrity you will acquire, and what a public service you will render, if, through your labour and exertion, the illustrious names of the King of England and all his dignified nobles, reach the ears of the inhabitants of India and Persia!” After this, the governor produced several volumes of books in the English language, and delivered them to Mulla Firoz, telling him that all past events, and all the circumstances connected with the conquest of Hindustan, were related in those volumes, that he must translate these narratives into Persian, then convert the translation into flowing verse, and have the poem transcribed in the Nushk character. Agreeably to the suggestion of that highly honourable and distinguished individual, Mulla Firoz directed all the energies of his mind to the undertaking, and spent many days and many nights in the composition of the work, till, after undergoing incalculable difficulties and trouble, he succeeded in a complete poetic description of all the past events, from the time of the arrival of the Europeans in Hindustan, and of the manner in which they at first confined their views to objects of commerce; from the condition of merchants were raised to that of governors; and, lastly, by the subjugation of their enemies, attained to absolute dominion. He bestowed,

besides, great, and even more than necessary, pains in imparting a sweetness and a polish to the language and construction of his verses; and, finally, through the assistance and support of the honourable governor Elphinstone, and governor-general Sir John Malcolm, he added to his poem by introducing into it a general description of the victories, triumphs, and territorial conquests which occurred during the administration of the before-mentioned illustrious governors up to the time of the capture of Poona and its dependencies, and the annihilation of the state of the Peshwa in the year 1817, and gave to it the title of *George Nameh*. Now, seeing that the executioner of fate has cut asunder the thread of the existence of that learned man and celebrated poet, and thereby plunged all the friends of that wonder of the age into the depth of grief and sorrow for his loss—a work attractive in a degree never seen before by any living soul—a work, the like of which had never reached the ears of the most unprejudiced and accomplished critics, without ever being brought to the notice of those who are in the habit of purchasing the productions of genius, and the treasures of literature, fell into neglect and obscurity, and, through the vicissitudes of time, became in a manner lost to the world. Such being the case, this humblest of the servants of God, Rustum, son of Mulla Kaikobad, and nephew of the same Mulla Firoz, thinking it a subject of reproach that such incalculable labour should be thrown away; that a gem of such purity should be as though it were not determined, with the advice of several kind and judicious friends, that the work in question, consisting of near 40,000 couplets, comprised in three volumes, each volume exhibiting the history of a single division of the countries of India, as thus: Vol. 1st. An account of the conquest of Bengal, and its dependencies. Vol. 2d. An account of the conquest of Madras, and its dependencies. Vol. 3d. An account of the conquest of Bombay, and its dependencies; should be lithographed in a good hand, and on approved paper. Having calculated the expense which would be incurred for printing, for the hire of subscribers, and the cost of paper, &c. he has fixed the price of the whole three volumes at sixty rupees; and he has now drawn up this advertisement, annexing a specimen of the work,\* with a view to excite in the minds of those who have a taste for productions of literary excellence, a desire to possess copies of it; and that each of them may give him notice, so that he may in due time provide for his being supplied with a copy.

Our readers by this time, no doubt, wish to know something of the writer of this remarkable epic; and we have great pleasure in being able to gratify them with the following sketch, from the account of the author and the work given to the committee by Sir Alexander Johnston.

The author of this poem, the late Mulla Firoz bin Kans, was one of the most distinguished Persian scholars and poets of his age. He was for many years chief priest of the

\* Of which we copy a very small portion:—

نچتور آزارو وراستا  
بوو پکمان نام پاک ضرا  
کشا یزه بتا نام اوست  
بوو تر آنکو نور ورام اوست

† Literally, the divers in the ocean of philosophy, and the connoisseurs in the pearls of learning.

Parsis of Bombay, who are followers of the doctrines of Zoroaster, are worshippers of fire, and generally known in Europe by the name of Gahrs. They are descended from those Gahrs who, when the caliphs of Bagdad endeavoured to convert them to Mohammedanism, in the eighth century, sooner than change their religion, gave up their country and their property, and settled at Surat. Some of them subsequently settled at Bombay, where their descendants now form a most respectable and most loyal class of her majesty's subjects. They have, by their industry, acquired great wealth in houses, lands, and money, and become very extensive merchants and ship-builders. A considerable part of the trade of Bombay is carried on by them; and all the line-of-battle ships, frigates, sloops of war, and other smaller vessels built at that port for the royal navy, are constructed entirely by builders of their class. The poem is an epic poem, in commemoration of the conquest of India by the British. In it the poet gives an account of all the heroic achievements and political measures of Lord Clive, Warren Hastings, the Marquess of Wellesley, Duke of Wellington, Marquess Cornwallis, and Marquess of Hastings; and describes, in the most animated language, the triumphs of British valour. He gives a history of the transactions of the British in India from the year 1600, when Queen Elizabeth granted the first charter to British subjects to trade in India, down to the year 1817, when the British government took possession of Poonah. He describes in detail the different steps by which the British, from having been mere merchants in the country, became, in 220 years, the sovereigns of the greatest empire that ever was known, extending from the Gulf of Cambay, west, to the frontier of China, east; and from the Himaylasya mountains, north, to Point de Galle, on the island of Ceylon, south; with a population of 100,000,000 of people; a sea-coast of from five to six thousand miles; a revenue, levied for the greatest part directly from land, of upwards of 18,000,000*l.*; and a standing army of 280,000 men. The late Mr. Duncan, then governor of Bombay, a man thoroughly acquainted with every branch of oriental literature, and with the opinions and feelings of the people of Asia, was convinced that the Persian poem called "The Shah Nameh, or History of the Kings of Persia," had, by celebrating in verse the conquests of the Persian government, created a high respect in the minds of the natives of Asia for the valour, policy, and power of the Persians; and thought that a Persian poem, to be called "The George Nameh, or History of George the Third," the then king of Great Britain, would, by celebrating in verse the conquests of the British government in India, create as high, if not a higher, respect in the minds of the natives of Asia for the valour, policy, and power of the British. Mr. Duncan having communicated his ideas and wishes upon the subject to Mulla Firuz bin Kans, this distinguished Persian poet devoted the last five and twenty years of his life to the composition of such a poem as Mr. Duncan had proposed; but, having died before it could be published, his nephew and successor, Mulla Rustum bin Kaikobad, has determined to publish a lithographic edition of it; and has written to Sir Alexander Johnston, requesting him to make known his intention throughout Great Britain and Europe, and to obtain patronage and subscribers for his work. Need we add one word to commend this work to libraries and the public at large?

## ROYAL SOCIETY.

First meeting of the present session, Mr. Baily in the chair.—A long list of valuable donations made to the Society during the recess, was read. The paper communicated to the meeting was a description of a new barometer, by the chairman. The author details the advantages possessed by this instrument over those commonly used; advantages so great, as entitled it to be considered a standard barometer.

## SOCIETY OF ANTIQUARIES.

THE Society held their first meeting of the session, Mr. Hudson Gurney in the chair.—Mr. Woodward exhibited drawings of two ancient swords, found near Norwich. Mr. Beltz communicated two documents from the archives of Tournay, one describing the entry of King Henry 8th, in state, into that place after the siege of it; the other, a letter from Queen Catherine of Arragon, announcing to the citizens of Tournay the birth of her child (afterwards Queen Mary).—The Rev. J. T. Girtton communicated an account of the discovery of Roman urns, ashes, and other remains, near Box Lane Chapel, Hertfordshire.—The Rev. Henry Crow exhibited an ancient dish of copper, richly enamelled,\* having inscriptions round the edge, on one half of the plate two angles bearing censers, and on the other the figure of a saint, with the words HENRICUS EPISCOPUS, supposed to be Henry bishop of Winchester, brother to King Stephen.

## LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday.*—Statistical, 8 P.M.; Phrenological, 8 P.M. (second meeting); Medical, 8 P.M.  
*Tuesday.*—Linnæan, 8 P.M.  
*Wednesday.*—Society of Arts, 7½ P.M.; Medico-Botanical, 8½ P.M.  
*Thursday.*—Royal Society, 8½ P.M.; Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.; Islington Literary, 8 P.M. (Mr. Henry Innes on the Literature and Literary History, particularly the Poetry, of Great Britain).  
*Saturday.*—Westminster Medical, 8 P.M.; Electrical, 7 P.M.

## FINE ARTS.

## NEW PUBLICATIONS.

*Portraits of the Children of the Nobility:* a Series of highly finished Engravings, executed under the superintendence of Mr. Charles Heath, from Drawings by Alfred E. Chalon, Esq. A.R.A. [R.A.] and other eminent Artists. First Series. London, 1837. Longman and Co.

THE conception of this publication was a brilliant idea. Subjects for it will never be wanting. From infancy to adolescence, there will always be, in the higher as well as in the humbler classes of life, an abundant succession of human flowers in blossom, from which the skillful artist may cull a rich pictorial garland. The first impression, or rather the renewed impression, made upon us on looking at these exceedingly interesting representations of "innocent little men and women" (as Johnson admirably called children), was, that there is an innate and intense charm in childhood, which no grotesque absurdity of fashionable costume, nor vile affectation of fashionable deportment, can efface. We fear, however, that there are too many mammas, and papas also, perhaps, who think their darlings are fascinating in consequence of those artificial deformities, not in spite of them. If this work should proceed (and the auspices under which it has commenced promise it a long life), the exposure of such a delusion will be one of its beneficial results. The mo-

\* This dish was engraved in the "Gentleman's Magazine" for December 1813.

ther of 1847, or 1857, will lift up her hands and eyes with amazement at her own portrait in the volume for 1837, and may probably be induced to suspect that, without her immediately being sensible of it, outrages against simplicity, taste, and elegance, although of a different description, are, at that very moment, perpetrating by the milliner, the dress-maker, and the dancing master, on the persons of her beloved offspring. The highest credit is due to Messrs. Chalon, Maclise, and Bostock, for the ability with which, notwithstanding the difficulties we have alluded to, they have preserved so much of the delightful beauty, vivacity, and grace, of the infantile and youthful character. Their efforts have been well seconded by the engravers, Messrs. Thompson, Mote, Cook, and Robinson. We beg leave, however, to recommend more attention to the drawing of the extremities. For instance, the feet of little Lord Grey de Wilton are so incorrectly foreshortened as to assume the appearance of pags.

*Ryall's Portraits of Eminent Conservative Statesmen. No. VI.*

THE portraits in the present Number are those of "The Right Hon. the Earl de Grey," drawn by John Wood, engraved by Joseph Brown; "The Right Hon. Lord Forbes," painted by B. R. Faulkner, engraved by Joseph Brown; and "Sir Robert H. Inglis, Bart. M.P.," painted by G. Richmond, engraved by J. Jenkins. They are all fine resemblances: but the last-mentioned is, perhaps, the most characteristic.

*The Interior of the Chancel of Stratford Church, Warwickshire,* as altered from the Designs of Harvey Eginton, Esq. Architect, and executed by Mr. Hamilton, under the direction of the Committee of the Royal Shakespeare Club. Titl.

"THE new roof and ceiling to the Chancel of Stratford Church, with other substantial repairs and restorations of that interesting and beautiful mausoleum to Shakespeare, being nearly completed," Mr. Eginton observes that he "is induced to publish an engraved representation of the interior of the building, to shew its design and effect to those subscribers who have not had opportunities to witness the work." As far as we are able to judge from the mere outline, the plate will appear at a future period with finished effect. Mr. Eginton has completely "succeeded in designing his new work to harmonise with the original, with the place, and the purpose." The outline is beautifully drawn by W. Buttingfield, and engraved by T. Turnbull.

## BIOGRAPHY.

## THE EARL OF EGEMONT.

THIS most distinguished patron of the fine arts died at his "princely Petworth," on the 11th, at the advanced age of 86. In him the arts of England have lost one of their best friends, and the artists one of their most generous benefactors. His collection of works, both of sculpture and painting, by British hands, is immense, and acquired during the course of a long life by a vast expediture, which raised many a lowly name to celebrity, and cheered the career of many a child of genius.

## THE BARON ALIBERT.

ON the 4th inst. died this celebrated physician, alike respected and honoured wherever he was known, and far as his works have travelled. During the period of five succeeding reigns, he has been the confidential physician and friend

of the court at Paris; and in him France has lost another of her *savans*. Though on the verge of seventy, he, until shortly, enjoyed all the haleness and spirits of a young man. In appearance he had none of the care-worn and pallid physiognomy which generally distinguishes medical men, and particularly those of France; but was considerably *embonpoint*, ruddy, and merry in countenance as he was in conversation. In short, he was one of those few with whom we sometimes meet, who seem to have the power of casting a halo of cheerfulness around them; and this will be remembered with a pleasing regret by the numerous friends and admirers he has left behind him. His class, as a lecturer, was always full; and, though often long, his subjects, from apt illustration and happy manner of delivery, were never tiresome. His writings have been many, and on various branches of therapeutics; but those by which he is most known to Europe are his treatise on the mineral waters of France and Germany; his "Physiology of the Passions;" and his voluminous and erudite work on diseases of the skin. He was one of the first, and, until his death, one of the most strenuous advocates for the treatment of a great majority of diseases by means of the fumigating and vapour baths; often observing, that there was no disease but might, in some of its stages, be much benefited by these means, and that they rendered much medicine unnecessary. It was a marked feature in his practice to assail and draw through disease by medicaments applied to the skin, rather than annoy the more vital organs, the stomach and bowels, by their internal administration; hence his predilection for baths, which are so generally resorted to as therapeutics on the Continent.—*From a Correspondent.*

#### DRAMA.

*Drury Lane* has, this week, been distinguished by nothing but the visit of her Majesty in royal state on Wednesday; on which occasion, 2s. were laid, in addition, upon the price of the boxes, and the pit admissions were raised to 3s. 6d. At *Covent Garden*, last night, where a similar honour was conferred, the fixed prices of the theatre were unaltered; and, though this involves a public question, we shall not waste many words upon it: the public must judge for itself. In the former case, a tax was levied upon the show of the queen's person. It was not for the drama, nor the interests of the drama; but purely for a sight of the sovereign, and the interests of an individual—the tenant of *Drury Lane*. That we utterly disapprove of this need hardly be stated. If the prices are to be altered in the case of one attraction, why not whenever there is any other? and we will then have a scale of fluctuating prices,—half-a-crown for a queen, eightpence for a male ruler, and sixpence for any other strange monster, such as Shakespeare mentions as irresistible by English curiosity, (*vide Tempest*.) In the respectable times of the stage, such a course was never dreamed of. The presence of the most exalted personage in the state, and an overflowing house, were deemed a sufficient reward; and no one thought of turning a penny by other means. Is it not enough to disgust her majesty, and banish her from the national theatre, which all who love it are so desirous that she should be courted to protect and encourage? We fear it is; and we lament the circumstance accordingly. With regard to *Covent Garden*, it has in this, as in every other respect, acted with propriety and honour. There was no

extra charge; no suspension of free lists, turning compliment into insult, by asking people to empty houses, and shutting the doors in their faces when they were likely to be full. As in the case of those unfortunate females who have long banished the decorous and virtuous from dramatic entertainments, Mr. Macready has firmly adhered to the legitimate principles he professed, and to more than the terms he held out to the public.\*

*Covent Garden*.—On Saturday, an opera, called the *Barbers of Bassora*, by Mr. Morton, jun. and the music by Mr. Hullah, was brought out here, and repeated on Wednesday with greater effect. It is a pleasing, though not important production; rather lively in dialogue and action, and with some sweet and simple ballad melodies. An Eastern tale, in which a barber (Phillips) is, by the whim of the caliph (Wilson), made vizier for an hour, and in this office contrives to win his lady-love (Shirreff), the daughter of barber *secundus* (Leffler), and defeat the claims of a domineering aga (Bartley), reveals the whole plot. Of the singing, we need only say that Shirreff, Phillips, Wilson, and Leffler, performed their parts as they always do, and were repeatedly encored; and that the rest of the characters were well acted. On the whole, we think Mr. Hullah displayed less originality than we had a right to expect from him; and thus, though the *Barbers of Bassora* may take their agreeable turn with other pieces, they are not sufficient to make any strong impression on the public. Of the *Original*, a clever and extravagant farce by the same author, Mr. Morton, produced on Monday, and acted nightly since, amidst much laughter and applause, we can speak in higher terms. It is extremely ludicrous and amusing, and admirably performed. Bartley and Meadows, the former all fire and fury, the latter all milk and water, have respectively a nephew and a daughter (Mr. Anderson and Miss P. Horton), whose union they oppose, but who are tricked out of their consents by the *Scapinations of Jack Nonpareil* (Vining), so that all ends well. In this character Mr. Vining is very happy. His disguises, and his persuading the two old gentlemen that each is deaf and dumb, which leads to a most comic scene of colloquy on their fingers, are hit off with much vivacity; and the little bit which Miss P. Horton has with *Col. Detonator* (Bartley), is quite in keeping with the general humour of the farce.

*St. James's*.—*Temptation*, by the author of the *Illustrious Stranger*, has been successfully produced here, and tempts the town every night.

*Queen's Theatre*.—This house was opened for the season on Monday, under the management of Miss Desborough, who appeared on that evening, but who, we are sorry to add, was taken suddenly ill while performing on Tuesday, and has not played since. She has

\* In all this gentleman's management, there is nothing, in our opinion, which so highly eulitizes him to respect and support as his conduct in this delicate matter, which is hardly brought under the cognizance of superficial observers, and the precise nature of which cannot be known to the general public. What is visible to all is, that the nuisance has been abated at *Covent Garden*, and that families of children, and youthful females, may go there safely, without the fear of insult, or being shocked by indecency of words or actions. Can we, without indecency, describe why and how this is? These poor creatures have been encouraged to ply their melancholy pursuits in the boxes and lobbies of our theatres, on paying 10s. each at the opening of the season; and, out of the future wages of their sin, handing over instalments to the owner of the theatre (can we call it so, or rather bagnio?), till he is fully paid for the privileges of prostitution. Mr. Macready at once repudiated this horrid and disgraceful system, and has purified his theatre by the sacrifice of many hundred infamous pounds.

formed an excellent company, and is nightly rewarded by good houses to witness the plays of *Timour the Tartar* and the *Dumb Factory Boy*, a new version of the *Dumb Man of Manchester*. Mr. T. Thompson personates the *Dumb Boy* with great truth and spirit; he is ably seconded by Mr. Ranson and Mrs. Parry in the serious, and Mr. Land and Miss Mitchell in the comic parts. Miss Mitchell is, we believe, nearly new to the stage, and holds out great promise of future excellence. We have only to add, that the amusements provided, which are concluded by eleven o'clock, will well repay a visit to the Queen's.

*Opera Buffa*.—The season commenced on Thursday evening, with a splendid house of nobility and persons of high fashion—an omen of perfect success, as we hope, to this charming theatre. The time occupied is truly within the compass of enjoyment, and not of fatigue. Two hours and a half are enough for any entertainment. The opera was *L'Elisir d'Amore*, the favourite of last season, and with the favourite supporters, Catone and Bellini. A deboutante, Signora Franceschini, and Fred. Lablache (the son of our great vocalist) were the novelties. Of the former we can say nothing very favourable; her voice is wiry and harsh, and she sang out of tune, in a manner not common on the Italian stage. Lablache was not much voice, but what he has is good. He sings correctly, and has much comic humour; so that his accession may be counted an acquisition of value to the stage. The orchestra was very fine throughout.

#### VARIETIES.

*Royal Society of Horticulture and Agriculture*.—There was a fine collection of plants, flowers, fruits, and vegetables, exhibited last Saturday at the Egyptian Hall, Piccadilly. Gold and silver medals were awarded for a beautiful specimen of the *Callya latibata*, a lovely, pink, lip-like flowering plant; also, for a specimen of the *Musa cavendishii*, and others. A curious collection of *Cacti* attracted much attention; and *Banksia floribunda*, *Cycas revoluta*, *Ocydium*, were splendid. Pears, apples, grapes, and cucumbers, were also very fine. The prizes were given by "The Royal Society and Central School for Floriculture, Horticulture, and Agriculture." A military band played during the day.

*The Civic Fête*.—A journal like ours has little to do with city feasting or royal entertainments; but there is one observation touching the late grand affair which it may peculiarly become us to notice. It is one not merely applicable to this occasion, or to the corporation of London; but, we regret to say, too general in its prevalence, and too characteristic of the country altogether. Among the guests in the Guildhall, as given in the published lists, we looked in vain to see if any honour had been paid to the science, the fine arts, or the literature, of England. The Duke of Sussex was there as a prince of the blood, not as president of the Royal Society; and, as connected with the considerations to which we have alluded, he was alone in his glory. No president of the Royal Academy, no president of the Royal Society of Literature, no president of the Royal College of Physicians, no great artist, no distinguished man of science, no eminent author, had the compliment of an invitation. Those who will be remembered in the rolls of fame, long after all the circumstances of this pomp and parade have sunk into nothingness, had not a single representative in the hall. In what other civilised nation in

Europe could such a neglect have been perpetrated? Not in Italy, France, Prussia, Austria, Holland, Russia, Bavaria—hardly in Turkey! But it seems quite an epoch amongst us if one of the immortal spirits of the age, one of the glories of a people, should be treated with respect. When Sir Walter Scott dined with George IV., all the newspapers and magazines rang with the marvel; and, in fact, we hear of every class of the community, soldiers, sailors, rich bankers, parvenus of fortune, obsequious officials, &c. &c. being the favoured in courts, palaces, and high places; but of those the best entitled to such courtesies, the names are never heard. Let us hope for other days!

**The Queen's Dinner Table.**—Mr. Charles Bleaden, who has been so highly and so justly commended for his excellent service at the Guildhall on the Queen's visit, has voluntarily and liberally afforded the public a very acceptable gratification during this week, by exhibiting her Majesty's table, covered as when she sat at it on the 9th, in the handsome dinner-room of the London Tavern. Thousands have flocked to see this splendid display of gorgeous plate, and superb glass, and ornaments of fruit and flowers. A constant succession of visitors have crowded the room, where a judicious disposition of the routine, and the presence of individuals belonging to the Tavern, assisted by several policemen, preserved order and regularity, so that every one saw in turn, and passed on. Among the attractions to the curious, certainly not the least were the richly embroidered doyleys, one of which the Queen took from the feast as a memorial of her royal civic entertainment. The exhibition, so handsomely opened at considerable expense and much trouble, we believe closes after to-day.

**Royal Academy.**—Last week, Mr. George Patten and Mr. Charles Landseer were elected Associates of the Royal Academy.

**Weather Predictions.**—Mr. Murphy, in a letter to the "Times," says, that his predictions for the 9th Nov. were fully (*q. foully?*) verified; since, "the unexpected change of weather in the afternoon, partaking as it did more of the nature of mist than rain, and as such not extending probably more than a mile or two on either side of the river, as it continued little more than an hour; consequently, according to the explanation of the term 'fair,' in the 'Weather Almanack'—viz. a day in which drought is expected to predominate, it cannot affect the correctness of my prediction, and I am happy to hear that such is the opinion expressed of it in the city. I should consider it as in some sort criminal, to pass over the circumstance of this prediction unnoticed; constituting, as it does, no more than an item in the account of the facts which the changes of the weather during the last month—or since the influence exercised by the late extraordinary summer, with the advance of the season, has subsided,—have added to the list: as can be attested by more than one gentleman, whose veracity will not be questioned, who have been in the habit daily of contrasting the calculations entered in my unpublished weather-tables for this period, long since prepared, with the passing changes of the weather; the conformity between these tables and the changes of the weather during the period noticed being so strictly accurate, that, with the exception of the three days which preceded the 9th inst., which were marked 'rain,' it might have been supposed that they were drawn up from a journal of the weather kept during that period, rather than from calculations long previously made.

The discrepancy in reference to the three days alluded to, was chiefly referable to the violence of the late gale on the 1st and 2d instant, as storms of that class are usually succeeded by intervals of drought, more or less considerable, according to the season of the year in which they occur. As refers to the most important of the late atmospheric phenomena—viz. the storms of the 27th and 29th ult., and that of the 2d instant, which, on the coast of Scotland, Liverpool, Plymouth, Boulogne-sur-Mer, &c., caused such destruction of life and property, as stated in the journals,—those of the 27th of October and of the 2d instant were accurately marked by me in a letter which I addressed to the editor of the *Literary Gazette* on the 21st, and which appeared in the succeeding number of that journal on the 25th of February, 1837; these, together with the gale of the 29th ult., being entered in my unpublished weather-tables alluded to, the last and most serious of these gales having been most violent at London on the 1st inst.; but, as being the principal site of its development (as noticed by me in my letter to the editor of the *Literary Gazette* alluded to), still further south on the following day, together with being more violent further south, having been accompanied, similar to a tropical hurricane, with thunder, &c."

**Weather Wisdom.**—Referring to our last, the only hit was a disposition to snow about the 17th. The next week runs thus:—"The 26th is stormy and colder. The new moon will bring increased cold and heavy falls of snow; or it may be much rain, with dense fogs."

**Bronzes.**—We had only yesterday an opportunity of seeing the fine collection of bronzes, in Bond Street, and can, therefore, say nothing more now but that they are well worth a visit.

**Steam.**—The French Director-General of the Posts has been lately employed at Marseilles, in facilitating, and rendering more expeditious and cheap, the intercourse by steam-vessels between France and the Levant.

#### LITERARY NOVELTIES.

Captain Glascock, R.N., the author of the "Naval Sketch Book," and other works, has, we hear, completed for publication a Story of various Adventures by Land and Sea. We understand that the scene, which is equally divided between London and the Channel, is laid in the time of George III., and that in the nautical portions, the author has raised the tragical incidents by introducing scenes, highly comic, and after the gallant captain's peculiar vein.

In the Press.

The Wonders of Geology, with numerous engravings, by J. Martin, Esq.

#### LIST OF NEW BOOKS.

Portraits of the Children of the Nobility, edited by Mrs. Fairlie, imperial 4to. 11. 11s. 6d. bd.—*Icones Plantarum*; or, Figures and Brief Descriptions of New and Rare Plants, by Sir Wm. J. Hooker, K.H. 2 vols. 8vo. 21. 10s.—*Electricity, its Nature, Operation, &c.* in the Phenomena of the Universe, by William Leitch, 8s. cloth.—A Letter to Sir Robert Peel, Bart. M.P. on Cathedral Churches, by the Hon. Geo. Pellett, D.D. Dean of Norwich, 8vo. 2s. stitched.—*Kittor's Domestic Medical Pocket-Book*, 12mo. 10s. 6d. cloth.—*Practical Religion: A Series of Sermons*, 8vo. 4s. cloth.—*Allison's History of the French Revolution*, Vol. VI. 8vo. 15s. bdg.—*Elements of the Practice of Obstetrics*, by Denman, new edition, 18mo. 3s. cloth.—*The Book of the Cartoons*, by the Rev. R. Cattermole, demy 8vo. 10s. 6d. cloth: royal 8vo. 16s. cloth.—*Trollope's New Testament in Greek*, with English Notes, 8vo. 11. 1s. cloth.—*Horæ Lyricæ: Poems by Dr. Watts*, with Memoir by R. Southey, Esq. 18mo. 3s. 6d. cloth.—*Bunyan's Pilgrim's Progress*, with Scripture Passages, 12mo. 4s. 6d. cloth.—*Life of Wallenstein*, Duke of Friedland, by Lieut.-Col. J. Mitchell, 8vo. 12s. cloth.—*Journals and Letters of the Rev. Henry Martin*, B.D. 2 vols. 8vo. 11. 1s. cloth.—*Outlines of Naval Routine*, by A. D. Fordyce, R.N. 8vo. 10s. 6d. cloth.—*Science of Life Insurance*, by P. Watt, 6s. bds.—*Treatise on Warming Buildings by Hot Water*, by Charles Hood, 8vo. 10s. 6d. cloth.—*Diatesaron*; or, the History of our Lord Jesus Christ, 8vo. 3s.—*The Poetical Works of Richard Lloyd*, royal 12mo. 10s. 6d. cloth.—*Fairland's Juvenile Artist*, oblong 4to. 8s. cloth.—*Gems from Shakespeare*, 2s. cloth.—*Memoir of Mrs. H. W. Winslowe with Essay*, by J. H.

Evans, 12mo. 5s. 6d. cloth.—*Obstetric Plates*, by Wm. Smellie, M.D. 8vo. 5s. cloth.—*The Pickwick Papers*, 8vo. 11. 1s. cloth.—*Mr. W. Hille's Treatise on Hernia*, 12mo. 2s.—*Head's Home Tour*, Vol. II. post 8vo. 9s. 6d.—*Little Arthur's History of England*, 11. 12mo. new edition, 3s. hf. bd.—*Somerville on the Sciences*, 4th edition, fcap 10s. 6d.—*Southey's Book of the Church*, 4th edition, 1 vol. 8vo. 12s.—*Eastern Manners illustrative of the Gospels*, by the Rev. Russell, 8vo. 10s. 6d. cloth.—*Heures de Récréation*, par St. L. Lazerac, post 8vo. 8s. cloth.—*Surgical Observations on Tumours*, by J. C. Warren, M.D. (Boston) 11. 1s. bds.—*Paths of Poesy*, 12mo. 5s. 6d. bds.

#### METEOROLOGICAL JOURNAL, 1837.

November.	Thermometer.	Barometer.
Thursday .. 2	From 37 to 47	29.04 to 29.14
Friday .... 3	... 29 .. 46	29.20 .. 29.36
Saturday ... 4	... 29 .. 47	29.40 .. 29.91
Sunday .... 5	... 31 .. 49	29.95 .. 30.05
Monday .. 6	... 28 .. 45	30.17 .. 30.29
Tuesday ... 7	... 23 .. 44	30.52 .. 30.2
Wednesday 8	... 30 .. 39	30.23 .. 30.15

Prevailing wind, S.W.  
Except the 3d, 5th, and 8th, generally clear; rain and hail on the 2d; lightning during the evenings of the 2d and 3d; and foggy in the morning and evening of the 8th. Rain fallen, 15 of an inch.  
Edmonton.

CHARLES HENRY ADAMS.

Extracts from a Meteorological Register kept at High Wycombe, Bucks, by a Member of the Meteorological Society, October 1837.

Thermometer—Highest .....	67.75 .. the 3d.
Lowest .....	27.00 .. 25th.
Mean .....	46.73790
Barometer—Highest .....	30.41 .. 14th.
Lowest .....	29.98 .. 30th.
Mean .....	29.84774

Number of days of rain, 13.  
Quantity of rain, in inches and decimals, 1.80.  
Winds.—2 North-East—2 East—1 South-East—8 South—3 South-West—11 West—3 North-West—1 North.

**General Observations.**—The maximum of the barometer was above any one in October, during the journalist's residence at Wycombe (fourteen years), and only twice has the mean been exceeded during that period; the last time, in October 1830, the quantity of rain was small, being very much less than the average. From the 5th to the 22d no rain fell. The mean temperature was below the average, although the maximum was higher than usual; the range was upwards of 40 degrees.

The night of the 13th, on which the lunar eclipse occurred, was remarkably clear, and the commencement and progress of the eclipse were seen very favourably; during the total obscuration, the body of the moon was of a dusky red colour, but when she began to emerge from the earth's shadow, and her bright limb was first seen, the appearance was very interesting; the colours of the remaining portion of her disc were from bright orange to red, purple, and dark blue, but these changed rapidly as the eclipse passed off: the thermometer, during the eclipse, fell from 41° 54' to 35° 25', the barometer standing very steadily at 30° 38'.

#### TO CORRESPONDENTS.

To the Editor of the *Literary Gazette*.

November 13, 1837.

Sir,—I beg to thank your correspondent, who writes from Brighton, under date of Nov. 5, and the signature of "An Old Subscriber," for the trouble he has taken with regard to the word *corseing*, and hope he will not take it amiss if I express my doubts as to whether his explanation is for a moment tenable. For, besides that I do not see by what process of inflection, or otherwise, *corseing* can be deduced from *corrige* or *corrigis* (which is the direct French word *corrigere*, and is derived from Lat. *corrigo*, compounded of *con* and *rego*), I cannot, if such be its derivation and meaning, affix any sense to the passage in which the word occurs. Your correspondent may, probably, have been, in some measure, misled by the way in which the passage appeared, *corseing of words* having been, by mistake, printed for *corseing of words*; I trust, however, that he is addicted to etymological pursuits, he will return to the investigation, and solve a difficulty which, at present, has puzzled every one to whom I have applied. There are, in our Dictionaries, two words, to either of which, in consequence of the uncertain orthography of former times, the word *corseing* may belong: but I much doubt, whether the sense of the passage is made out by referring it to either one or the other.

1st. *Corrode*, corrosive: Lat. *corrodere*, to gnaw. Upon this Richardson observes, *corrosive* appears to have been strangely corrupted by our old writers—*corrie*, *coronic*, *corisic*, *coraisic*, *corrasive*, *corrosic*.

2d. *Course*, coursing: Lat. *cursus*, from *currere*, to run. To *course* is to run, to run after, to pursue, and thence, *course-ing*, quasi *course-ing*.

Perhaps a reference to the original edition, which is at present out of my power, might remove the difficulty, either by bringing to light some typographical error, or by some other elucidation, of which we are not at present aware.—I am, Sir, &c.

To C. P. J. The party is identical.

## ADVERTISEMENTS,

Connected with Literature and the Arts.

**THE OLD AND APPROVED SYSTEM,**  
by which Subscribers are supplied, in Town and Country, with every New Publication, British and Foreign, as soon as published, having given universal satisfaction ever since its establishment in 1826, is still pursued at Churton's British and Foreign Library, 96 Holles Street.

On Tuesday, November 31st, will be published, price

One Shilling and Sixpence.

**WHITE'S CELESTIAL ATLAS;** or, an Improved Ephemeris, for the Year of Our Lord 1838, wherein are contained the Places of the Old and New Planets, the Eclipses, Occultations, and other Celestial Phenomena of the Year; also, a Complete Almanack, with an Appendix, containing Tables of Logarithms to Six Decimal Places; of Logarithmic Sines and Tangents to every Second Minute of the Quadrant; and of Natural Sines, Tangents, Secants, and Versed Sines, to every Degree, with the Solutions of Plane and Spherical Triangles.

By OLINTHUS GREGORY, LL.D. F.R.S.  
Professor of Mathematics in the Royal Military Academy, Woolwich, and One of the Board of Visitors of the Royal Observatory at Greenwich.

••• This Almanack, which has been a great favourite with scientific men for nearly Ninety Years, has received considerable improvements since it has been in the hands of the present Editor, and especially since it has been increased by a Supplementary Sheet. The Tables of Logarithms, and of Logarithmic Sines, Tangents, &c., now published, have been carefully corrected by collation with those of Uranus; and these, together with the Rules and Theorems for Plane and Spherical Trigonometry, will render the work highly valuable to Practical Astronomers, Mariners, Civil Engineers, and Teachers of Mathematics, as they will, in all the ordinary cases of Trigonometrical and Astronomical Computation, serve as a complete substitute for the more expensive Logarithmic Tables.

London: Printed for the Company of Stationers, and sold by George Greenhill, at their Hall, Ludgate Street.

On Tuesday, November 31st, will be published, price 1s.

**THE MEDICAL ALMANACK;**

## SPLENDID ANNUAL, 1838.

**FINDEN'S TABLEAUX;**  
or, Picturesque Scenes, Illustrative of National Character, Beauty, and Costume, with large and beautifully engraved Plates.  
Edited by MISS MITFORD.Author of "Our Village," &c. &c.  
"Regally gorgeous—the literature is choice in kind. The little stories, and especially Miss Mitford's contributions,—"English Edith," for instance, with her happy loves; and the pleasant "Wager,"—are exactly of that light and graceful description which is most suitable to such works as the present."—*Tait's Magazine.*"An Annual of the same class to which the 'Flowers of Loveliness,' and the 'Gems of Beauty,' belong, and it is superior to both in its plan and execution."—*Spectator.*  
Imperial 4to. splendidly bound in morocco, 2l. 2s.; India Proofs, 2l. 2s.  
Charles Tilt, Fleet Street.

Price 2l. 2s.

**THE AUTHORS OF ENGLAND.**Fifteen large and beautiful Plates, engraved in the new Bas-relief Style, with Biographical and Critical Sketches.  
By HENRY F. CHORLEY.Author of "Memoirs of Mrs. Hemans," &c. &c.  
"The Authors of England" is an Annual of the first magnitude and importance. It is composed of a group of fourteen of the most popular writers of poetry and fiction in our own times, departed as well as living—each set in a rich frame-work of tasteful device. The volume is superbly got up; the embossed cover, with its handsome badge, is very elegant."—*Spectator.*  
"This, for the present season, shall be our annual. The plates are exquisitely engraved."—*Athenæum.*  
Charles Tilt, Fleet Street.**THE ORIENTAL ANNUAL.**By the Rev. HOBART CAUNTER, B.D.  
With Twenty-two Engravings, from Drawings by the late William Daniell, R.A.Elegantly bound in morocco, price 2l.; or large paper, with Proof Plates, 3l. 12s. 6d.  
"In point of binding, gilding, and ornament, 'The Oriental Annual' has hitherto been gorgeous, while the plates are always in a first-rate style, and eminently illustrative of the glorious East. The volume now before us, we are inclined to think, excels in these particulars."—*Mon. Revue.*  
"It is scarcely possible to imagine a more beautiful book: the binding is perfect."—*Literary Gazette.*  
Charles Tilt, Fleet Street.

No. I. of
